BRITANNICA BOOK OF THE YEAR
(Trade Mark Reg. U.S. Pat. Off.)

IN THIS VOLUME, in addition to bibliographies of books and periodicals, references are made to films which cover the subjects of many articles. In all instances the films referred to are 16-mm. sound motion pictures which were produced in 1951. So these references, in addition to giving the reader information about further visual study he can pursue on these subjects, provide a record of most of the major 16-mm. films produced during the year.

There are thousands of 16-mm. films, and perhaps the most comprehensive source of titles and subjects is the *Educational Film Guide* published by the H. W. Wilson Company, New York, N.Y.

These 16-mm. films may be obtained from many film rental libraries maintained throughout the United States by state universities, by many public libraries and by commercial visual-education dealers. The Film Council of America with headquarters in Chicago, Ill., and its community Film Councils can usually provide information about how to obtain the films. Many public libraries can also give this information. Should these sources fail to help in securing a desired film, the reader should write directly to the producer.

The editor of the BRITANNICA BOOK OF THE YEAR *acknowledges with gratitude the privilege of using 52 pictures from* LIFE. *Acknowledgments of the copyright ownership of all illustrations may be found on the following three pages.* THE EDITOR

INTRODUCTION

THE PRESENT *Britannica Book of the Year 1952* is the fifteenth in the series. It marks the closing half century of American ownership of the *Encyclopædia Britannica.* During those fifty years the centuries-old tradition of Britannica authority and utility has been jealously maintained and the scope of Britannica and its area of influence have been greatly extended.

The present year also marks the publication of "Great Books of the Western World," edited by Robert M. Hutchins, and launched under the auspices of *Encyclopædia Britannica* and The University of Chicago.

Encyclopædia Britannica is an accumulation of information, the Great Books is an accumulation of great ideas—ideas which are the invaluable tradition of the civilization of what is more or less a free west.

A measure of hope for the future of the world—for the very life of a free world—lies in the fact that Britannicas, Books of the Year, Great Books can still be published and distributed in the open. Not all nations have been drawn behind the "iron curtains" of dictatorship. And if the world is to be free, there is desperate need that there always be a free exchange of information and ideas. Vigilance against those who do not believe this must be alert and active every minute.

Alberto Gainza Paz, former editor of *La Prensa,* of Buenos Aires expressed dramatically how "dictators contain their people behind curtains of silence" and this can happen in any country. He said:

> In the Andean reaches of South America the mountaineer knows well how that bird of prey, the condor, destroys the lamb. First the condor flies high in the sky making great circles. Little by little it comes down until, with a great beating of its wings, it circles round and round the little animal which by now is frightened and bewildered. Quickly the vulture darts in and plucks out the eyes. When the lamb opens its mouth to cry for help, with equal rapidity the condor tears out the tongue. Afterwards, the bird of prey calmly ends the work of destruction and consumes his victim. Thus dictators destroy the eyes and silence the tongue of people. Then, blind and mute, the people lose their liberty. I believe that in this hour our message to free men and women throughout the world can be summed up in these few words: Let us take care of the eyes and tongues of our peoples.

So long as there is free communication of information and ideas the eyes and tongues of our peoples have some chance to bring peace and happiness to the earth.

WALTER YUST

EDITORS AND CONTRIBUTORS

WALTER YUST, *Editor of Encyclopædia Britannica and of the Britannica Book of the Year*

HOWARD E. KASCH, *Associate Editor of the Britannica Book of the Year*

RUTH SOFFER, *Picture Editor*

(*Initials and names of contributors to the Britannica Book of the Year with the principal articles written by them. The arrangement is alphabetical by initials.*)

A.A.At. Mathematics
A. ADRIAN ALBERT. Professor of Mathematics, The University of Chicago. Author of *Modern Higher Algebra;* etc.

A.A.P. Greece (*in part*)
ALEXANDER A. PALLIS. Minister Plenipotentiary attached to the Greek Embassy; Director of the Greek Office of Information, London, Eng. Author of *Greece's Anatolian Venture—and After;* etc.

A.Ar. Motion Pictures (*in part*)
ART ARTHUR. Executive Secretary, Motion Picture Industry Council of Hollywood, Calif.

MAX LOEB. Member Advisory Staff, National Beer Wholesalers Association. Former Executive, Illinois Liquor Control Commission.

M.L.W. **Four-H Clubs**
M. L. WILSON. Director of Extension Work, U.S. Department of Agriculture, Washington, D.C. Author of *Farm Relief and Domestic Allotment Plan;* etc.

M.Mack. **Albania** (*in part*)
(JOHN) MALCOLM MACKINTOSH. Programme Organizer, Bulgarian and Albanian Sections, British Broadcasting Company's Overseas Service, London, Eng.

M.Mo. **Intoxication, Alcoholic**
MERRILL MOORE, M.D. Visiting Neurologist, Boston City Hospital, and Clinical Associate in Psychiatry, Harvard Medical School, Boston, Mass.

M.O'N. **Coast Guard, U.S.**
MERLIN O'NEILL. Vice-Admiral, U.S.C.G. Commandant, United States Coast Guard, Washington, D.C.

M.S.Er. **Hearing**
MATTHEW S. ERSNER, M.D. Professor and Head of the Department of Oto-Rhinology and Rhinoplasty, Temple University School of Medicine, Phila., Pa. and Associate Professor of Otology, Graduate School of Medicine, University of Pennsylvania, Philadelphia, Pa.

M.S.F. **Japan**
MIRIAM S. FARLEY. Editor, *Far Eastern Survey*, American Institute of Pacific Relations, Inc., New York, N.Y. Author of *Aspects of Japan's Labor Problems;* etc.

M.Si. **Printing**
MACD. SINCLAIR. Editor, *Printing Equipment Engineer*, Cleveland, Ohio.

M.Sp. **Death Statistics; etc.**
MORTIMER SPIEGELMAN. Assistant Statistician, Metropolitan Life Insurance Company. Co-author, *Length of Life;* etc.

M.Sr. **Birth Control**
MARGARET SANGER. Honorary Chairman, Planned Parenthood Federation of America, Inc. Co-chairman, Board of Trustees, the Margaret Sanger Research Bureau.

M.Te. **Iowa**
MILDRED THRONE. Associate Editor of the State Historical Society of Iowa, Iowa City, Ia.

M.T.H. **Federal Deposit Insurance Corporation**
MAPLE T. HARL. Chairman, Federal Deposit Insurance Corporation, Washington, D.C.

M.V.N. **Bacteriology**
MILAN VACLAV NOVAK. Professor and Head of the Department of Bacteriology, University of Illinois College of Medicine, Chicago, Ill. Bacteriologist in Chief, Research and Educational Hospital, and Consultant on Bacteriology, Veterans' Administration, Hines, Ill.

M.V.W. **Juvenile Delinquency**
MIRIAM VAN WATERS. Superintendent, Reformatory for Women, Framingham, Mass. Author of *Youth in Conflict;* etc.

M.W.H.C. **Georgia**
MORRIS W. H. COLLINS, JR. Assistant Professor of Political Science, The University of Georgia, Athens, Ga. Acting Director, Bureau of Public Administration.

M.W.Ss. **Aqueducts**
MICHAEL W. STRAUS. Commissioner, Bureau of Reclamation, U.S. Department of the Interior, Washington, D.C.

Na.G. **Fairs and Exhibitions** *(in part)*; **etc.**
NAT GREEN. Manager, Chicago, Ill., Office, Ringling Bros. and Barnum & Bailey Combined Shows Inc.

N.C.B. **Lumber** *(in part)*
NELSON C. BROWN. Professor Emeritus of Forest Utilization, New York State College of Forestry, Syracuse University, Syracuse, N.Y.

N.F.S. **Jet Propulsion; Munitions of War** *(in part)*
NATHANIEL F. SILSBEE. Colonel, U.S.A.F.R. Contributing Editor, *Aviation Age* and *Skyways*, New York, N.Y. Co-author of *Jet Propulsion Progress.*

No.B. **Jerusalem**
NORMAN BENTWICH. Professor of International Relations, The Hebrew University, Jerusalem, Pal. Author of *Palestine; Judea Lives Again; Jewish Youth Comes Home;* etc.

N.Sy. **Music** *(in part)*
NICOLAS SLONIMSKY. Music Critic. Composer. Author of *Music since 1900; Music of Latin America;* etc.

N.T. **Socialism** *(in part)*
NORMAN THOMAS. Socialist Presidential Candidate, 1940, 1944, 1948. Author of *America's Way Out; A Socialist's Faith;* etc.

N.T.R. **Coinage**
NELLIE TAYLOE ROSS. Director of the United States Mint, Washington, D.C.

O.E.L. **Hawaii**
OREN E. LONG. Governor of Hawaii.

O.L.Ds. **Securities and Exchange Commission**
ORVAL L. DuBOIS. Secretary, Securities and Exchange Commission, Washington, D.C.

O.M.T. **Arabia** *(in part)*; **Jordan** *(in part)*; **etc.**
OWEN MEREDITH TWEEDY. Former British government officer. Author of *By Way of the Sahara; Cairo to Persia and Back;* etc.

O.R.E. **Federal Security Agency**
OSCAR R. EWING. Federal Security Administrator, Washington, D.C.

O.U.C. **Archery**
OLIVE U. CROUCH. National Archery Association.

P.A.E. **Irrigation**
PAUL A. EWING. Former Senior Irrigation Economist, U.S. Department of Agriculture.

P.Ae. **Colorado**
PEARL ANOE. Feature Writer for the Colorado State Publicity Department, Denver, Colo.

P.A.W-T. **Golf** *(in part)*
PAT AINSWORTH WARD-THOMAS. Golf Correspondent, *Manchester Guardian*, London, Eng.

P.Br. **Billiards**
PETER BRANDWEIN. Sports Writer, *The New York Times*, New York, N.Y. Editor, Sports Section, *Information Please Almanac*, etc.

P.By. **Cleveland; Ohio** *(in part)*
PAUL BELLAMY. Editor, *Cleveland Plain Dealer*, Cleveland, O.

P.Dn. **English Literature** *(in part)*
PATRIC DICKINSON. Author of *Stone in the Midst and Poems; The Sailing Race and other Poems;* etc.

P.E.M. **European Recovery Program**
PHILIP E. MOSELY. Professor of International Relations, Russian Institute of Columbia University, New York, N.Y.

P.G.L. **Netherlands**
PIETER GEYL. Professor of Modern History, University of Utrecht, Netherlands; former Professor of Dutch History and Institutions, University of London, London, Eng. Author of *The Revolt of the Netherlands; Napoleon, For and Against.*

P.H-My. **Barbados; Jamaica; etc.**
PHILIP HEWITT-MYRING. Public Relations Adviser on Behalf of the Development and Welfare Organization in the West Indies.

P.L.W. **Chemotherapy**
PAUL L. WERMER, M.D. Secretary, Committee on Research; Assistant Secretary, Council on Pharmacy and Chemistry, American Medical Association. Co-author of *General Practice Treatment.*

P.M.Hg. **National Labor Relations Board**
PAUL M. HERZOG. Chairman, National Labor Relations Board, Washington, D.C.

P.M.Sy. **Botany** *(in part)*
PATRICK MILLINGTON SYNGE. Editor to the Royal Horticultural Society. Author of *Mountains of the Moon; Plants with Personality*, etc.

P.Ss. **Insurance** *(in part)*
PERCY STEBBINGS. Insurance Editor and Correspondent to *Financial Times, Bankers' Magazine, Inventors Chronicle*, London, Eng.

P.Ta. **Employment; Strikes**
PHILIP TAFT. Professor of Economics, Brown University, Providence, R.I. Author of *Economics and Problems of Labor;* etc.

NINETEEN FIFTY-ONE

A Survey of Cultural Trends of the Year

By Isaiah Berlin

Fellow of All Souls College, Oxford University, and Visiting Lecturer at Harvard University

One of the most notable characteristics of the literary and artistic scene during the year 1951, not merely in western Europe but beyond its confines, was the revival of religion, in the widest as well as the narrowest sense of the word, as a central issue of discussion. Historians of opinion have often noted the fact that periods of doubt and scepticism, of criticism and analysis directed against the dogmatic certainties and orthodoxies of previous periods, are as a rule followed by new periods of faith and irrationalism.

But as a rule, the ages of faith are to some degree also those of reason; there is a dominant opinion, there is also an opposition; during the ascendancy of sceptical rationalism, the voices of antirationalist faith are never wholly silent; and during the rise of orthodoxy or emotional abandonment to ideals conceived as either above or at any rate beside empirical or rational inquiry, are seldom allowed to occur unchallenged but are compelled to run the gauntlet of what is usually described as radical or left-wing opposition.

Nevertheless, during the year, it appeared almost as if the rising preoccupation with religious or quasi-religious—metaphysical and eschatological—issues was becoming almost a monopoly. Who were the most discussed authors in western Europe in the course of the year? In England they were, among the novelists, Evelyn Waugh and Graham Greene. These were authors noted not merely for the fact that both were members of the Roman Catholic Church, but that the issues with which they dealt were concerned with specifically religious problems, and provided by them with specifically religious solutions. Indeed, the popularity of Graham Greene, his novels, stories and articles for journals, or of broadcasts and films directly or indirectly founded upon his works, seemed to derive as much from the issues with which he dealt as the purely literary skill and depth with which he dealt with them.

Similarly there was interest in the work of Herbert Butterfield, because he was an avowedly Christian historian who discussed historical and metaphysical problems which occupied the thoughts of many persons; and this was one of the most powerful causes of the continued interest displayed in Europe, and far more deeply in the United States, in the views and writings of Arnold Toynbee.

Among poets and essayists, T. S. Eliot occupied an easily pre-eminent place, again perhaps as much because in his essays and last plays he dealt with what were to him the most fundamental issues—the condition and destiny of the individual soul—which now after many years had become a topic which captured the intellectual imagination of the general public to a greater degree than any, perhaps, during the last two centuries. Some among the most distinguished literary critics in England—C. S. Lewis, Lord David Cecil, Basil Willey—were writers, if not on religious topics, at any rate with much implicit religious feeling. Even the purveyors of lighter forms of art—the popular playwright Christopher Fry, for example—found themselves treating religious issues not so much because of any obvious preoccupation with them as because of a sensibility of the currents of thought and sentiment, a natural inclination responsive to the nature of the public interest of the times.

In France, the works of François Mauriac had long been the centre of growing interest and fascination; his articles in *Figaro* had about them a magistral quality possessed, perhaps, by no other public prophet; and the mere fact that he was able to denounce Jean Cocteau's last play—*Bacchus*—as heretical, and formally to read the author out of the church, was an event scarcely conceivable in the France, let us say, of 20 years before. It seemed almost as if with André Gide and Paul Valéry the last great secular voices of France had ceased to speak; for Paul Claudel, their great Catholic friend and violent opponent, had won; Cocteau replied to Mauriac in a tone certainly as serious as that in which his religious views had been impugned. It is scarcely conceivable that such an exchange on such a topic could have occurred, with such solemnity, between, say, Valéry and Charles Péguy. Yet Mauriac was able to thunder; Cocteau replied with great earnestness and dignity; the public was profoundly interested. And although the Existentialists, who still to some degree dominated the literary and intellectual scene, were by no means all formal adherents of established faiths, yet even the atheistical Jean-Paul Sartre or Simone de Beauvoiz dealt with the human predicament in a sense which nearly touched the attitude of those to whom metaphysical and religious issues were of the deepest concern. And this, of course, was even more true of such religious thinkers as Gabriel Marcel, one of the most widely admired of French *penseurs*.

It is what Luther called the human abyss that was the central topic of the most prominent writers of France, and those who did not deal with this—say, Valéry or Jean Giraudoux, or even the celebrated Alain, who died in 1951—seemed more out of date, less relevant to contemporary discussion, than Pascal or Renan or Péguy.

The plays of Marcel, the plays and philosophical essays of Sartre and Albert Camus, the philosophical essays of such writers as Jacques Maritain or Jean Wahl and Kojève, the interest increasingly taken in the Russian theological essayist Nikolai Berdyaev, or the Jewish theologian Martin Buber, the brooding presence of Martin Heidegger and Karl Jaspers, and behind them the greater figures of Nietzsche and Kierkegaard, dominated French intellectual circles to the relative exclusion of older liberal and humanistic writing.

Against this virtually the only voices which were raised loudly were those of the Communists, who, unlike the more rationalist Marxists of an earlier day, preached a fanatical counter-religion of their own. The celebrated Gallic spirit—secular, detached, humane, sceptical and concerned with the empirical facts and the lives of men on earth—the spirit of Voltaire and Diderot, of Michelet and Taine, of Flaubert and Proust, seemed temporarily in abeyance. Socialism, liberalism, rationalism had won their victories and become absorbed into the texture of normal experience and lost their cutting edge. The wave of metaphysical spiritualism seemed to have engulfed all or at any rate much of what was most gifted and expressive in France, or temporarily obscured from view other tendencies which might have been stirring.

In the United States, a similar phenomenon was observable: The writings of W. H. Auden and Reinhold Niebuhr enjoyed a great vogue; it was the saintly life and faith of Albert Schweitzer, not his music, that was mainly responsible for his sudden vast celebrity in America; novels which dealt with religious subjects, at all levels of artistic skill, seemed assured of wider circulation than those concerned with almost any other topic; such an indicator of popular taste as *Life* magazine contained a greater proportion of writing on religious and metaphysical topics, supplied now and then by Waugh and Greene, and less directly by the mild humanism of F. S. C. Northrop, than it would have done, say, a decade earlier. An attack on Yale university for alleged deficiencies in its religious instruction assured its author greater fame than the treatment of any social or political topic.

This was naturally added to by the fact that on the continent of Europe the parties which held power, in Germany and Italy, for example, and entered into the coalitions which governed France, were avowedly religious, as they could scarcely have been 15 or 20 years earlier; and this fact, which in certain respects resembled similar political developments during the 19th century, differed from them in that the anticlerical opposition in the west did not seem to possess that ancient vehemence which served to throw the issue into such violent relief during the great *Kulturkampf* battles in France, Germany and Italy in the last century.

Italy seemed least affected by this profound difference in outlook: Italian art and literature continued to be far more secular and to preserve a far greater continuity with the European outlook before World War II than they seemed to have done in any other country.

This growth in the religious outlook did not, as in the past, take the form either of the consolations of religion to a distraught and despairing generation, which had found its older values too easily flouted and overthrown by the brutality and moral cynicism of the day, nor yet of some rigorous hierarchical discipline offering a strong and secure asylum for those who found it difficult or impossible to withstand the chaos and fury of the world by their own unaided resources. Although the religious revival might indeed have had one or both of these effects, the form which it took was something relatively new, and owed more to Dostoievsky than to the orthodox doctrinaires of any of the churches. For what the books and essays and plays and histories of the return to Christianity tended to stress was the seamier side of life, to paint with a realism as grisly and violent as any employed by the "slice of life" writers of an earlier, more atheistical generation the least attractive aspects of social relationships and individual experience.

In a sense, this attitude was the successor, and no less sophisticated and "highbrow," to the two other great movements which had dominated modern times—psychoanalysis and Marxism. And like them, it conveyed to its followers the impression that it too was cutting through the mere surface of the phenomena to the hideous depths below, which must be faced because they were real, because they existed, and exercised an influence more decisive upon the course of human life than the more superficial phenomena which composed the worlds of science or common sense. And in the very chaos, irrationality and violent malformations and morbid growths which were thus rendered patent to the shrinking eye of the unhappy but fascinated observer, they discovered not the inexorable laws of psychology nor the inevitable laws of social development, nor the material for any other positive science, but the inscrutable workings of God.

In a sense, this was the modern theodicy, which by stripping away the rationalizations and other constructions both of the intellect and of the imagination with which human beings had sought to screen themselves from the truth, sought to discredit reason and empirical methods, in order to make room for faith as alone being strong enough to discover meaning and purpose in the abounding folly, weakness and vice which any unflinching analysis was bound to reveal in the contemporary scene; to restore faith in God and the spiritual government of the universe by making the light shine out of the darkness; the more inspissated the darkness, the brighter by comparison the saving light without which the darkness could not be judged or described or analyzed at all.

It was a sign of the times when so "progressive" and *avant-garde* a publication as the *Partisan Review* in New York city, for example, devoted itself to the examination of its writers' attitude to religion and printed the works of Jaspers. To any observer, dispassionately considering the artistic and intellectual scene of 1951—when Henri Matisse completed his murals in Vence chapel, William Faulkner wrote a novel with a religious motif, Gian-Carlo Menotti wrote an opera (for television) on a religious topic, the newer popular films dealt with biblical subjects and the conversions of former Communists to the Roman Catholic Church became events of daily expectation—it appeared that this mood was not a simple "escapism" after the disenchantment and failure of energy and morale resulting from the destruction wrought by the war, but sprang from some deeper cause, in this case perhaps the failure of misinterpreted psychologies or a belated reply to Marxism; for the Marxist movement had during the last 20 years been gradually changing from a characteristically critical, rationalistic Victorian doctrine, appealing to intellectuals—a sophisticated and elaborate theory, full of subtleties, and above all with a severely scientific tone—into the simple, dogmatic, fanatical faith, relying upon endless repetition of simple formulas and the worship of visible symbols of sanctity and power.

In response to communism of this type, as practised in the Soviet Union, and imposed upon the satellites in a very crude and all too visible fashion, there was bound to spring up a counterfaith of greater complexity, refinement, psychological depth and artistic quality, in response to the freer and more many-sided and sensitive civilization of the west.

Traditional religion provided something far stronger and more genuine—and even more anti-rational—than the ersatz faiths of the 20's and 30's. What seemed certain at the moment was a continuing process of slow pulverization of all intermediate positions—of all the older forms of liberalism, secularism and tolerant humanism—between the upper and the nether millstones of the rival religions which appeal to civilized mankind.

The phenomena described were, of course, not necessarily symptomatic of the prevailing views of the majorities of the populations of the western countries; they represented at most the strongest tendencies of those literary and artistic élites which set the tone in such societies. But it is in this context that the literary and artistic life of the year 1951 should be surveyed.

* * *

The change of atmosphere from the first three or four decades of the century became peculiarly noticeable when contrasted with such works about the comparatively recent past as R. F. Harrod's biography of Lord Keynes and, even more, N. G. Annan's life of Sir Leslie Stephen, both of which appeared in the course of the year. In both these works a world is revealed the principal ideals of which were the pursuit of knowledge, the contemplation of interesting and beautiful things for their own sake, the cultivation of personal relationships, personal sincerity driven to almost fanatical degree, with, above all, an avoidance of anything remotely savouring the pursuit of worldly success, or of rhetoric, or of betrayal of private to public values in any form. Despite the fact that Keynes's world was in open rebellion against that of Leslie Stephen, it shared with it its sense of revolt against the accepted institutions of the great Philistine establishment into which they were both born, and both rejected in their various ways the religious and the political orthodoxies of their time for the values of private worlds and the cultivation of artistic and personal ideals.

The death of André Gide, who was himself the high priest of a movement in France not dissimilar to this, in which the worship of beauty and of personal relationships and insistence on scrupulous sincerity and candour in both had taken the place of other social and religious values, served to underline the great distance stretching between the universe of that distinguished writer and the modern world into which he had survived.

The year, too, saw the death of the essayist Alain, whose detachment and sceptical pacifism in their turn contrasted oddly with the new preoccupations of the contemporary generation in the major European countries.

In France such recognized and distinguished writers as Georges Duhamel and Jules Romains, as well as authors of the second rank, like Claude Farrère, Pierre Benoît and Paul Morand, continued to write; the works of Colette, Jacques Chardonne, as well as those of Paul Valéry, Valéry Larbaud and André Maurois appeared in collected editions, but it was not they who set the tone. This was done to a far greater degree by Mauriac, who was the most distinguished representative of Catholic orthodoxy in France; by Jean-Paul Sartre, whose play *Le Diable et le Bon Dieu* enhanced his already dominant reputation as being the most ingenious, penetrating and significant writer in France, and perhaps in western Europe—in the sense that all the most typical tendencies of the time seemed to be, at times perversely and deliberately, but always sharply, focused in his work, and presented to the public with exceptional professional *expertise*. He was the leader, quite apart from his specific philosophical point of view, of all those who, in contrast with the antipolitical *révolté* writers of an earlier generation, preached the duty of total self-commitment—the necessity of taking up a position, however personal and individual, but nevertheless a position involving responsibility, in relation to the religious, the political, the social and metaphysical tendencies of the times. In this sense, Albert Camus in his new *L'Homme révolté,* although he was perhaps a better writer, clearly followed Sartre's intellectual leadership. So also Julien Gracq, despite his tendency to Surrealism, nevertheless bowed sufficiently to the spirit of the times to make his latest allegory avowedly political; this writer rejected the Goncourt prize awarded to him, as a protest against literary academies and prizes as such because they made for intellectual bondage and mediocrity, and stifled and corrupted much original enterprise.

This mood, sometimes earnest and almost hopeful, at other times cynical, preoccupied and engaged in emphasizing the hopeless and often revolting aspects of the contemporary human tragedy, was seldom one of desire to withdraw from the scene. The inevitability of involvement was, in France, stressed explicitly or else automatically taken for granted. In this atmosphere charged with the sense of the importance of social and political reality, the works of Victor Hugo were duly rediscovered and overpraised; the German romantic philosophers who were themselves preoccupied with political issues, such as Hegel and Fichte, were being studied afresh. The darker living German metaphysicians such as Jaspers and Heidegger, continued to exercise a considerable influence. What was conspicuously lacking in the realm at any rate of belles-lettres was the traditional French "classical spirit"—lucid, ironical, detached, critical, intellectually firm, free from the clouds of tormented emotion and the mixture of mysticism and metaphysics characteristic of the Germans, and scarcely able to articulate its broken vision by means of that luminous, measured prose which had been once the glory of France. Such elegant trifles as those published by Louise de Vilmorin, or the poetry of such writers of genius as Paul Eluard and Jules Supervielle, or such plays, still within the classical French tradition, as those of Jean Anouilh, could scarcely be said to have secured the continuity of French letters. The central current remained dark and turbid. The only great author apparently untouched by it in France was André Malraux, who did not produce an original work in the course of the year to compare with his magnificent masterpiece, *The Psychology of Art,* of two years before.

The situation was somewhat different in England, which retained a greater degree of continuity with its own sane and sober past; despite the impact made by Graham Greene's *The End of the Affair,* which dealt with the themes, now common in the work of this author, of infidelity, corruption and salvation by faith (the novel curiously resembled the earlier formulas of Ernest Hemingway, save that for communism, the Roman Catholic faith is substituted), there appeared a number of civilized and agreeable novels by Nancy Mitford and Enid Bagnold, Hester Chapman and Julia Strachey, L. P. Hartley and Anthony Powell, a more considerable work by Victor Pritchett, a novel by J. C. Powys in his accustomed strain, as well as one by Ivy Compton-Burnett, who pursued her thin but pure vein of gold, in apparent detachment from the gusts and waves of the contemporary *Zeitgeist.* It was not a time of great imaginative masterpieces. As for poetry, W. H. Auden published his *Nones,* and a poem entitled "The Chimeras," which gave renewed evidence of his magnificent gifts.

The stream of autobiographies and memoirs continued unabated; the most interesting among these was Stephen Spender's *World Within World,* in which, with his accustomed candor, slowly, and without elegance, but with a direct vision of the object (which he possesses almost uniquely in the modern world), he described his youth in the literary and artistic world of the 1930s. It was perhaps the best book yet produced by this distinguished poet and critic, and was widely acclaimed and attacked for much the same reasons as similar confessions, for which Rousseau set the fashion, had been praised and assailed, and invariably survived the attacks of their detractors. Sir Norman Angell published the story of his life, and thereby of a world which now seemed remoter than that of the 18th century; Katherine Mansfield's letters to her husband, J. Middleton Murry, saw the light during the year, and also wore the air of extreme remoteness. Nicolas Nabokov, the composer, published a delightful book of partly social, partly musical reminiscences, and his cousin, the most brilliant of novelists and poets, Vladimir Nabokov, published an account of his early life in Russia and in England, with a gay, boldly original and sometimes acutely poignant virtuosity, which he alone possesses among modern writers. The correspondence of Paul Claudel and André Suarès was published in France.

Julian Green published the fifth volume of his *Journal;* a remarkable collection of essays on contemporary Italy, by the Catholic writer A. C. Jemolo, saw the light; Ezra Pound's *Letters* proved an extremely arresting commentary on the literary and spiritual issues with which they dealt; by comparison with this the collection of reflections by the ageing American-Spanish *penseur* George Santayana appeared a trifle exhausted. Volumes of poetry were published by Walter de la Mare, David Gascoyne, Conrad Aiken, Robert Penn Warren, and Robert Lowell. These were distinguished and sometimes beautiful, but made no new summer in the field of English poetry.

Nor was the field of imaginative literature made wider by the latest works of the highly competent and readable Alberto Moravia or even by Carlo Levi, or by J. P. Marquand's or Faulkner's new novels, or the latest work of John Dos Passos, who continued along predictable and astonishingly conventional lines.

There was greater life and originality in *La Cometa* by R. Bacchelli, a still consistently underestimated Italian novelist.

In Germany nothing of notable interest appeared; apart from the *pièces justificatives* of those who somewhat unconvincingly claimed to preserve their own integrity under the nazis, and the half-apologetic literature seeking less directly to justify general German behaviour during this period, German literature seemed to have contracted into a thin and scarcely notable trickle. Ernst von Salomon, an old prenazi fascist writer, produced a new work along his old violent nihilistic lines, which, however exciting its effect in the early 1930s, was not merely a symptom that the hysterical irrationalism of this type was not yet dead in Germany. Hans Carossa produced a slight but charming book. Ernst Curtius published a new volume of critical essays; these were sensitive and civilized, but added little to their author's already deserved reputation of one of the few critics of European stature.

Mario Praz published a collection of characteristically brilliant but uneven quality; critical writings appeared in England by Frank Leavis, Percy Newby and Charles Morgan; and there was a collection of occasional pieces by E. M. Forster, of charm, beauty and depth, which, because of the dearth of writings from his pen, was a literary event in itself.

In the United States Edmund Wilson, perhaps the most distinguished of all literary critics, published a collected edition of his comments on life and letters in the 1930s and 1940s, and there appeared a collection of essays by Lionel Trilling of striking interest and distinction. William Empson published one of his characteristically meticulous and original analyses of the language of poetry. In France Jean Paulhan produced an interesting essay on aesthetics. The celebrated novelist Sinclair Lewis died in the course of the year, and brought to memory a genre very different from the fashion of the day; as a writer he had long outlived himself.

Eudora Welty and Truman Capote published novels which achieved excellence in a style which had become commoner in America than it was in Europe, in which technical perfection, a remarkable degree of professional skill and a sense of métier (which European writers all too often despise) did something to compensate for the absence of sufficient content to sustain so elaborate a vehicle.

In this respect, the *New Yorker* magazine (whose editor and founder, Harold Ross, a figure of great originality and life, died during the year) had created a new category of imaginative writing—its short stories were better built and better written than similar stories in Europe; they seemed to some to lack inner life, and indeed appeared often not to have quite enough to say; but their emergence as a specific literary genre was a phenomenon worthy of notice in itself, and did much to raise literary standards in all English-speaking countries from the chaos and boneless structure into which the fear of formalism, which developed in the 1930s, had threatened to plunge young English and American writers.

* * *

The drama was going through a singularly fallow period. Apart from such established figures as Sartre and Cocteau in France, only Christopher Fry produced anything fresh. He seemed very much the Edmond Rostand of our day—light, gay, melodious, elegant, skilful, perhaps trivial. His plays in rhyme seemed neither intended, nor likely to achieve, immortality; they contributed to the trend toward the formally pleasing, rather than the profound, the shapeless and the original, as a kind of light foil to set off the preoccupation with religious and metaphysical issues among the more serious. The best of modern actors, Louis Jouvet, died in the course of the year.

Even in the U.S.S.R. this mood of marking time prevailed. No new novels or poems appeared to excite even the normal extravagant praise of the orthodox party critics.

The official head of Russian literature, Aleksandr Fadeyev, was engaged upon rewriting his prize-winning novel, *The Young Guard,* in a manner designed to correct errors and suitably to emphasize the role of the Communist party among wartime partisans; the more eminent V. Katayev was also busy rewriting his older works, now discovered to be inadequate. The themes officially laid down for writers were those of the "battle for peace," denunciation of warmongering in the west, aggrandizement of the Russian and soviet past, and epics of industrial and agricultural reconstruction. Creative activity appeared to be quiescent over the wide area of the Soviet Union.

In short, the literature produced in the course of the year, apart from the clear religious trend, lacked well-defined characteristics; the nostalgia and controlled despair and consciously temperate realism, as well as violent escapes into fantasy and pornography, of the immediate postwar years seemed to have ended; good authors were writing well, and inferior authors, badly—but each was treading established paths, without any sense of new beginnings; 1951 was not a year likely to be notable in the literary histories of the future.

There were new scholarly editions of Montesquieu and Chateaubriand, of Hölderlin and Goethe, a new edition of the forgotten scientist and mathematician and *penseur* of the 18th century, G. C. Lichtenberg; the revision of the definitive edition of the works of Boswell was completed; Winston Churchill published two further volumes of his magnificent memoirs; Rear Adm. S. E. Morison continued his history of the naval war; much solid work was done on the papers and the life of Jefferson; an authoritative account of Palmerston's foreign policies was published by Sir Charles Webster; Austin Lane Poole published his long-awaited volume on English history from the Domesday book to Magna Carta; A. L. Rowse issued the first volume of his imaginative and scholarly survey of the age of Elizabeth; the end of the Austro-Hungarian empire was analyzed with much learning by the German historians Hantsch and Muensch; Steven Runciman published the first volume of a history of the crusades; Bishop David Mathew published an elegant study of the age of Charles I, and B. H. G. Wormald, a life of Clarendon; Julian Amery continued his life of Joseph Chamberlain; a number of scholarly studies of English literature during the Romantic age saw the light.

Two lives by Salvador de Madariaga and Waldo Frank, respectively, of the great liberator of Latin America, Simon Bolivar, were published to commemorate his centenary. Newton Arvin published the most distinguished of the many works which appeared to celebrate Herman Melville on the occasion of the centenary of the publication of *Moby-Dick*.

The Italian counterreformation received classical treatment in the hands of R. Quazzi. In Leningrad the distinguished but unfortunate E. Tarlé was compelled by the fiat of his soviet critics to rewrite his life of Napoleon for the third time, in order to bring it into line with the prevailing dogma on the subject. U.N.E.S.C.O. (the United Nations Educational, Scientific and Cultural organization) published an ambitious scheme for the production of a universal history, to be composed by an international committee, divided into national subcommittees of historians—the resulting compilation to appear in various formats and successive abbreviations for the use of scholars, universities and schools of the world, in order to secure a uniform objective survey of history and counteract national prejudices.

* * *

A number of interesting biographies and memoirs appeared. Beside the biographies of Lord Keynes and Leslie Stephen, there was a life of the humanitarian Labour politician Josiah Wedgwood by his niece, the gifted Veronica Wedgwood; there was a biography of Henry Irving by his grandson, and of David Lloyd George by his old friend and secretary of his cabinet, Thomas Jones; the duke of Windsor and Gen. Omar N. Bradley published their memoirs, and Lord Sysonby, posthumously, his memories of three rulers. New and remarkable letters by Lady Hester Stanhope to a young man in whom she took an interest gave pleasure to a public for whom Arthur Bryant wrote his study of the English social and political scene under the Regency. There was a great outpouring of wartime memoirs, principally apologias for their activities in Hitler's regime by German diplomats: Herbert von Dirksen, E. H. von Weizsäcker and von Blücher and one or two other minor former nazi officials sought to whitewash themselves and received condign treatment from the ruthless and unsparing pen of L. B. Namier.

An original and pungent set of lectures on American foreign policy by the U.S. diplomat George Kennan made a deep impression: it held a plea for professional diplomacy as against the casual imposition of American ideals on peoples, and in situations, unsuited to them; it spoke in sorrow of the difficulties of democratic control of the process of conducting foreign relations. The diaries of James Forrestal, who had been United States secretary of defense, contained much acute and controversial writing by a talented and very unusual man. A noble biography of the Swiss historian Jakob Burckhardt was launched by Werner Kaegi Kargi, and an interesting study of the young Ludwig Ranke was published by Von Laue. Edgar Lobel, of Oxford, published an exquisitely edited reconstruction of fragments of a newly discovered ancient Greek play; Sir Kenneth Clark published a beautifully written and justly admired work on the painter Piero de' Franceschi.

It was clear that the streams of pure scholarship were flowing once more. Long-term projects conceived on the grand scale were being launched, and an atmosphere of intellectual security and solid attention to detail prevailed. At the higher academic and intellectual levels there was an atmosphere of tranquillity for the first time since the end of the war.

* * *

But by far the richest harvest was to be found in the field of music. The greatest event of the year was the staging on Sept. 11, in Venice, of a new opera by Igor Stravinsky, *The Rake's Progress,* of which the libretto was composed in English by the English poet, W. H. Auden, assisted by Chester Kallman. It was an occasion of great social brilliance, and attracted the kind of attention which a new opera by Verdi or Wagner used to receive in the 19th century. There was a general agreement that the opera was a masterpiece—the music was limpid, elegant and inspired, and possessed that peculiar magical quality which Stravinsky's best works had never lacked. It seemed as if this composer had begun on that phase of austere and luminous creation, compounded of a blend of exquisite, serene and ironical melody and a spontaneous and arresting new kind of counterpoint, which sometimes qualifies the late phases of great artists, when the sensuousness of their middle works is vanishing, and a noble, transcendent, life-giving gaiety takes its place.

The year saw the death in California of Arnold Schönberg, the founder of the 12-tone scale—perhaps the most discussed composer of the age. Schönberg's works, of which an *opus postumum* was performed in the course of the year, never became intelligible to the general public, and his final value awaited the verdict of posterity. But there is no doubt that he transformed the musical consciousness of his time, and, abandoning the late Wagnerian romanticism with which he began in his earlier, central European, phase, he created a new musical language, a new framework, within which a whole new art of expression came into being, and commanded the most passionate, and at times fanatical, devotion of his followers, among whom there were several composers of undoubted genius. Whether or not Schönberg himself was a great composer cannot be decided, save by those who recognize no other master. But no critic competent to judge musical works would easily deny that title to Bela Bartók, who was deeply inspired by Schönberg, or to Alban Berg, the lyrical and dramatic composer whose best opera, *Wozzeck,* was, amid much acclamation by the musical world, programmed both in London and in New York city in the course of the year. Schönberg had among his disciples, too, the noble and austere composer Anton von Webern; the lively and interesting innovator Ernst Křenek and many other musicians of varying gifts, temperaments and degrees of originality. Perhaps, like the composers of the Mannheim school of the 18th century, he was the cause of greater creative gifts in others than in himself; but his theories and his compositions, his gifts as a teacher, his self-denying devotion to his musical ideal, his very personality (about which there was hot controversy after the semibiographical sketch which, according to some, Thomas Mann had given of him in one of his last novels) created an abiding monument in musical history. With Bartók and Stravinsky he remained one of the greatest composers of the first half of the 20th century.

There were a good many other musical events of interest and of value. There were two new works by Arthur Honegger, and a work entitled *Winter Campfire*—not heard in the west—by the still prodigiously creative Sergei Prokofiev; and a dignified "morality" opera entitled *The Pilgrims' Progress* by the ageing British composer Ralph Vaughan Williams, and, by him also, a cantata, *Sons of Light.* Benjamin Britten, still the most talented composer of opera in Britain, conducted a performance of his *Billy Budd,* adapted by E. M. Forster from the story by Herman Melville. Like all the works of this musician, it overflowed with musical gifts, was at once original and echoing with eclectic reminiscences, and possessed exceptional skill in construction. Oddly enough the Italian composer Shedins, apparently unaware of Britten's plans, also wrote a *Billy Budd* a year or so before; and this story was, during 1951, adapted for the stage in two versions: in these matters the *Zeitgeist* seemed to operate with an almost pedantic promptness.

The Italian-American composer Gian-Carlo Menotti produced an opera written for television, entitled *Amahl and the Night Visitors,* a fantasy on the journey of the Magi. An opera entitled *Incognita,* by the celebrated musical historian and composer Egon Wellesz, was produced at Oxford, and astonished its listeners by the fact that it was not atonal, as had been expected.

The Spanish composer Roberto Gerhard wrote a gay work entitled *The Duenna;* and the German composers were again singularly prolific. Werner Egk, Carl Orff, Hermann Reutter and Karl Amadeus Hartmann poured forth works with a copiousness worthy of Hindemith himself. A somewhat more interesting composer also continued to produce work of remarkable lucidity and elegance—the German-Russian composer Boris Blacher of whom much was expected.

In the United States new works were written by Roy Harris and the very gifted Lukas Foss.

Beyond the "iron curtain," besides Prokofiev, there appeared 24 preludes and fugues for the piano by Dmitri Shostakovich. The unfortunate composer was once more called to order for incurable formalism and an unlucky inability to escape western influences.

The ancient war horses of the regime, Dmitri Kabalevsky and Herman Zhukovsky, produced routine works—the latter not without sharp political criticism. Czechoslovak music, which seemed promising both before and after the war, had been subtly flattened out by the new regime, and the spate of such works as *Hands Off Korea,* a *Cantata for Gottwald,* and so forth, were credibly reported to possess no musical merit.

Somewhat exotic works, performed in Paris, by the Russian émigré composers Ivan Wyschnegradsky and Maria Scriabin (daughter of the celebrated composer Alexander Scriabin and presumably a relation of V. M. Molotov) left both the critics and public totally perplexed.

Interesting books on music were published: a posthumous volume by Schönberg; the authoritative studies of Schubert; and a collection of critical essays by Virgil Thomson, who, after the death of the gifted English composer and writer Constant Lambert, stood out as one of the most arresting contemporary critics of music in the western world.

The greatest loss in the world of musical interpretation was the death of Artur Schnabel, one of the greatest musicians and the foremost player of Beethoven of his day. As teacher and player he possessed a moral and intellectual authority in the musical world which was equalled perhaps only by that of Pablo Casals.

The number of musical festivals in Europe and America was once again evidence of the fact that music, or at any rate the performance of it, was enjoying a flowering unlike that of any other art. Not only the great festivals of Edinburgh, Salzburg, Perpignan and Aix-en-Provence, but at least a dozen others both in Europe and America, were occasions for a great volume of music both old and new, performed with a quality which was steadily rising. A work entitled *Polyphonie X,* by Pierre Boulez, evoked protests from the audience at the Donaueschingen festival—a rare occasion in which a musical audience was not sufficiently cowed by what appeared to it cacophony to give open expression to the violence of its sentiments.

There was a festival in Tiberias of Israeli music. Behind the "iron curtain" an opera composed by Paul Dessau, with libretto by Bert Brecht, was given in Berlin. This work, however, was condemned as insufficiently conformist.

Arturo Toscanini conducted a series of incomparable concerts in New York city. Toscanini's style appears to have risen in his deep old age toward a luminous and transcendental ideal, and while the unique combination of absolute discipline, ceaseless electric tension, noble breadth and depth and an almost superhuman freedom from self-indulgence had, if anything, reached even a higher level, the Italianisms—the fiery Italian rhetoric, the tendency toward the operatic—had altogether fused away.

The year also saw the passing of three celebrated conductors—the Dutchman Willem Mengelberg, once a singularly dynamic and vigorous figure in the world of music, whose collaboration with the German invaders of his country had plunged him into a disgrace from which he never completely recovered; and Fritz Busch, who, with his brother Adolf Busch, belonged to a musically gifted German family; after raising the performances of the Dresden opera to a great height, he then performed the same services for the Glyndebourne festivals in Britain; without attaining to genius, he was a conductor of very great distinction.

The third conductor to die in the course of the year was Sergei Koussevitzky, who conducted with all the charm and *doucer de vivre* of the Russia of the *ancien régime.* He made the Boston orchestra one of the best bodies of musicians in the world. Without attaining to the heights of a Toscanini or an Otto Klemperer, he conducted gracefully and delightfully, and with unparalleled pleasure to himself and his audiences. Nicholas Medtner, who died in March, belonged to this culture too. He was a Russian composer and pianist of singular sincerity and charm, whose gifts were less recognized than they deserved, and who was perhaps the last representative of the great Russian school of composition to which Nicolas Rimsky-Korsakov and Sergei Rachmaninoff still belonged, and from which Stravinsky and Sergei Prokofiev represented a bold and successful rebellion. During his last years he attracted the interest of an Indian potentate who subsidized his concerts and founded a Medtner society to record his works.

While no specific, powerful new trend was discernible in musical composition, the variety, life and sheer quantity of composition was at the moment so great as to justify belief that there was beginning a musical renaissance, even if only of an Alexandrian and derivative, rather than a wholly original, kind. The United States, with its 702 symphony orchestras, was in a unique position to commission and perform the works of the young composers.

* * *

In the other arts there was relatively little to report. The Italian school of films, which two or three years earlier presented the most creative experiment at that moment in progress in the world, was worthily represented by the film *Miracle in Milan* (produced by Vittorio de Sica), which, like the earlier films of this school, was filled with progressive liberal humanism—a kind of artistic reflection of the liberal socialism of the Italian non-Communist left-wing intelligentsia.

Apart from a sensitive, and almost overtragic, Swedish film based on Strindberg's *Miss Julie,* nothing appeared worthy of exceptional note, although a great standard of technical excellence now seemed assured in the major countries of the west, particularly in British documentary films. Perhaps the best of such films were the Swiss film *Four in a Jeep* and Jean Renoir's poetical *River;* the American *Death of a Salesman* and *A Streetcar Named Desire* translated the precise qualities of these plays efficiently and not altogether unmemorably into the medium of the screen. But the popular films of the year, responding to the religious trends, were such vast and tasteless shows as *David and Bathsheba, Samson and Delilah, Quo Vadis* and *Fabiola,* which precisely corresponded to the vast, harmless, religious novels and literary standard of the type of *The Robe* or *The Big Fisherman* or Francis Cardinal Spellman's *The Foundling,* deeply enjoyed by vast numbers of readers in the United States and Europe.

* * *

The greatest show of the year was the Festival of Britain, in which an attempt was made to paint a national autobiography. The pavilions on the South Bank of the Thames river were built in what was for Britain a daring and elegant modernity; the use also of a decorative "skylon"—a stylized lozenge pointing upward from the centre of the exhibition, was a worthy tribute to the uselessness and beauty of objects made for their own sakes. There were distinguished sculptures by Henry Moore and others to decorate the exhibition. The progress of the sciences and the crafts was recorded with some skill; there was an exhibition of sculpture in a portion of Battersea park, and a number of minor musical festivals as well as that of Edinburgh celebrated the occasion. Ships carried microcosms of the exhibition to the coastal cities of the British Isles. But the most imaginative portion of the affair was the Pleasure gardens in Battersea park in London, which John Piper and Osbert Lancaster designed, and which provided a charming, ironical and delightfully witty evocation of the mid-Victorian period, when the original Great Exhibition, of which this marked the centenary, first came into being. The gloom of British postwar depression was genuinely lightened by the dash and style and brilliant colour of the gay pastiche here provided with such gusto, and a half-sentimental, half-ironical nostalgia. The performances in the two theatres of the Pleasure gardens carried on this quality of sophisticated satire. The number of visitors was great; and with the celebration of the second millenary of Paris, which caused that city to make an elegant display of its own unique and unsurpassable qualities, formed two bright centres in an otherwise somewhat sombre day.

* * *

It was a thin year in the visual arts. Expressionism and Surrealism seemed enfeebled, and abstract painting and sculpture of various types appeared to dominate the field in a peaceful but not striking fashion. The greatest living painters were growing older, though not less productive, and genius seemed tardy among the young. Matisse completed the Vence chapel; Georges Rouault and Georges Braque were painting, but did not exhibit. The greatest of all, Pablo Picasso, still appeared to be in the state of marvellous gaiety and youthfulness, in which he had decorated clay and porcelain dishes, illustrated the *Natural History* of Buffon, painted satyrs on the rocks of the Riviera, and was obviously still launched upon a sea of delights and fantasies which sprang from his own unique vitality and perpetually self-renewing genius.

In the United States attacks were launched upon alleged propensity on the part of American museums for "left-wing" art—a paradoxical development inasmuch as such cultural "bolshevism" is, of all forms of art, the most abhorred and persecuted in Communist countries.

* * *

In the sciences there was no spectacular advance although much progress was noted in mathematics. In medicine—notably in the field of antibiotics—scarcely a day passed but the hope of new drugs to cure ancient diseases was expressed both in general and in specialized publications.

New types of atomic weapons, particularly light missiles, suitable for use against troops in the field rather than cities and great installations, were reported to have been perfected in the United States, and to have transformed the art of war.

* * *

In philosophy the great chasm which still yawned between the empiricists and logicians of the English-speaking and Scandinavian countries, and the metaphysicians and quasi-religious thinkers and philosophical scholars of the German and Latin countries, continued to divide the two philosophical worlds as sharply as ever.

The more rigid forms of Positivism were still melting both in Britain and the United States into a far more imaginative and sensitive, if not less empirical instrument—and this appeared to be largely the effect of the oral doctrines of the Austrian philosopher Ludwig Wittgenstein, who died in Cambridge, Eng., in the course of the year, leaving disciples devoted to his memory and his methods to a degree of which no other philosopher of the day could boast. Wittgenstein had begun as a logician and the follower of Bertrand Russell, but at the height of his philosophical development altered his views, and practised a technique whereby more light was thrown upon some of the most tormenting problems of modern philosophy than the older and more mechanical methods had succeeded in doing. This new and more flexible method required qualities of imagination and insight, and even a kind of poetical genius, which Wittgenstein himself possessed to a degree not shared by even his most gifted disciples. His teaching was the most fruitful contribution to the abstract thought of the day made by any single human being. His influence, powerful enough already, seemed likely to spread further, as a result of the vigorous proselytizing activities of his disciples. Otherwise, though much competent technical work was published by positivists and their allies, nothing of exceptional importance emerged.

In France Gaston Bachelard wrote imaginatively in his own unique manner about the philosophy of science; Wahl continued his metaphysical reflections, influenced by both Kierkegaard and Jaspers. The metaphysical works of the German romantics received renewed attention. A philosophical congress, held in the capital of Peru, merely served to underline the distance which separates such philosophical analysts as A. J. Ayer of London—perhaps the most lucid exponent of modern positivism—from such French metaphysicians as Gabriel Marcel, between whom there was scarcely any common ground for philosophical discussion, only some possibility of meeting in terms of social or political concepts which did not form the main interests of either of these thinkers.

In the Soviet Union the formal logicians, who in the guise of applied mathematicians had hitherto escaped the purges which had decimated other departments of knowledge, were finally, after two decades, attacked in their little enclave together with the mathematicians proper. The practitioners of these abstract disciplines, which because of the relative lack of interference by the Communist party had, both in the realm of pure mathematics and mathematical logic, accomplished distinguished work in the past few decades, were informed that such formalism was highly prejudicial to the orthodoxies of Marxist doctrine. They were further informed that mere lip service to the Marxist dialectic, and the conventional compliments to Stalin, would no longer be sufficient; they must transform their outlook radically, and bring their studies into line with the rest of the soviet ideology. It was too early to tell whether or not this rang the final knell on the only independent abstract studies still pursued in the U.S.S.R.

In chemistry a vigorous Marxist polemic against western theories of valency was launched by the adherents of more materialist models. It was difficult to tell how far this was due to party pressure, to anxiety to conform to the party's demands on the part of the scientists, and how far to genuine addiction to the material models of the 19th century on the part of Russian chemists who, brought up in the tradition, were relatively insulated from western influences.

* * *

The year ended inconclusively, with the issues of foreign policy dominating over the struggle between the political parties in the United States; with the far east still in flames; the middle east in a condition of mounting upheaval; with fear of general war on the whole abated, but the general outlook, particularly in view of Britain's semibankrupt economic position, far from bright. The news of the death of Henri Pétain, of Fritz Thyssen, who had supported Hitler, and of former Crown Prince Wilhelm von Hohenzollern ("Little Willie") served to comfort those who looked back upon the past as to a brighter and securer day with the reflection that the confusions and moral delinquencies and great blunders of that time seemed to itself no less dark and fatal than the present to its inhabitants.

THE year 1952 of the Christian Era corresponds to the year of Creation 5712-5713 of the Jewish calendar; to the year 1371-1372 of the Mohammedan hegira; to the 176th year of the United States; and to the 184th year of the *Encyclopædia Britannica*.

JANUARY 1952

1 New Year's day.
4 Independence day, Burma.
6 Epiphany, or Twelfth-night.
8 Second session of 82nd U.S. congress convenes.
8 Jackson day.
13 Festival of St. Veronica.
20 Eve of St. Agnes.
26 Republic day, India.
26 Foundation day, Australia.
27 Feast of St. Chrysostom.

FEBRUARY

2 Candlemas. Purification of the Virgin.
2 Ground-hog day.
4 150th anniversary, birth of Mark Hopkins, U.S. educator.
8 Boy Scout day, U.S.A.
10 Septuagesima Sunday.
10-11 Partial eclipse of the moon, visible at Washington, D.C. (date as of Greenwich civil time).
12 Lincoln's birthday, 1809.
12 Georgia day, U.S.A.
14 St. Valentine's day.
22 Washington's birthday, 1732.
24 Quinquagesima (Shrove) Sunday.
24 Feast of St. Matthias.
25 Total eclipse of the sun, invisible at Washington, D.C. (date as of Greenwich civil time).
26 Shrove Tuesday, Mardi gras.
27 Ash Wednesday.

MARCH

1 St. David's day, patron saint of Wales.
2 First Sunday in Lent.
2 Texas Independence day.
11 Purim (Jewish festival), 1st day.
12 Girl Scout day, U.S.A.
15 Ides of March.
17 St. Patrick's day, patron saint of Ireland.
20 Equinox (4:14 P.M. Greenwich civil time), beginning of spring.
25 Annunciation. Quarter day.
30 Seward day, Alaska.

APRIL

1 All Fool's day.
1 100th anniversary, birth of Edwin Austin Abbey, U.S. painter.
6 Palm Sunday.
10 Jewish Passover, 1st day.
10 Maundy Thursday.
11 Good Friday. English bank holiday.
13 Easter Sunday.
14 Easter Monday. English bank holiday.
14 Pan-American day.
15 500th anniversary, birth of Leonardo da Vinci, Italian painter, sculptor, musician, mechanician, engineer and natural philosopher.
19 Patriots' day, U.S.A.
19 Primrose day, England.
23 St. George's day.
25 St. Mark's day.
25 Anzac day, Australia and New Zealand.
26 Confederate Memorial day (also May 10, May 30, June 3).
30 Independence day, Israel.

MAY

1 May day. International labour festival.
5 Cinco de Mayo, Mexican holiday.
11 Mother's day, U.S.A.
17 Constitution day, Norway.
17 Armed Forces day, U.S.A.
18 Rogation Sunday.
22 Ascension day.
24 Victoria day.
30 Shebuoth (Jewish Pentecost).
30 Memorial (Decoration) day, U.S.A.
31 Union day, Union of South Africa.

JUNE

1 Pentecost (Whitsunday).
2 Whitmonday. English bank holiday.
5 Constitution day, Denmark.
8 Trinity Sunday.
11 Kamehameha day, Hawaii.
11 Feast of St. Barnabas.
12 Corpus Christi.
14 Flag day, U.S.A.
15 Father's day, U.S.A.
17 Bunker Hill day, U.S.A.
21 Solstice (11:13 A.M. Greenwich civil time), beginning of summer.
24 Midsummer day. Quarter day.
24 St. John's day.
29 100th anniversary, birth of John Bach McMaster, U.S. historian.
30 St. Paul's day.

JULY

1 Dominion day, Canada.
4 Independence day, U.S.A.
4 Independence day, Republic of the Philippines.
5 Independence day, Venezuela.
9 Independence day, Argentina.
12 Orangeman's day, Northern Ireland.
14 Bastille day, France.
15 St. Swithin's day.
21 Independence day, Belgium.
22 Feast of St. Mary Magdalene.
25 Occupation day, Puerto Rico.
26 St. Anne's day.
28 Independence day, Peru.
31 Tishah Bov (Jewish Fast of Ab).

AUGUST

1 Lammas day. English bank holiday.
1 Independence day, Switzerland.
5 Partial eclipse of the moon, invisible at Washington, D.C. (date as of Greenwich civil time).
6 Feast of the Transfiguration.
10 Feast of St. Lawrence.
14 Independence day, Pakistan.
15 Assumption of the Blessed Virgin Mary.
20 Annular eclipse of the sun, invisible at Washington, D.C. (date as of Greenwich civil time).
24 Feast of St. Bartholomew.

SEPTEMBER

1 Labor day, U.S.A.
1 13th anniversary, beginning of World War II.
7 Independence day, Brazil.
15 Independence day, Costa Rica, El Salvador, Nicaragua, Honduras and Guatemala.
16 Independence day, Mexico.
17 Constitution day, U.S.A.
20 Rosh Hashanah (Jewish holiday beginning year 5713), 1st day.
20 Mohammedan year 1372 begins at sunset.
20 Regatta day, Hawaii.
23 Equinox (2:24 A.M. Greenwich civil time), beginning of autumn.
26 Dominion day, New Zealand.
29 Michaelmas. Quarter day.
29 Yom Kippur (Jewish day of Atonement).
30 Feast of St. Jerome.

OCTOBER

4 Feast of St. Francis of Assisi.
4 Sukkoth (Jewish Feast of Tabernacles), 1st day.
12 Columbus day.
18 Feast of St. Luke.
18 Alaska day, Alaska.
25 St. Crispin and St. Crispinian.
27 Labour day, New Zealand.
28 Independence day, Czechoslovakia.
31 Hallowe'en.

NOVEMBER

1 All Saints' day. Allhallows.
2 All Souls' day.
3 Independence day, Panamá.
4 General Election day.
5 Guy Fawkes day.
7 The October Revolution, U.S.S.R.
9 Lord Mayor's show, London.
11 Martinmas, or St. Martin's day.
11 Armistice day.
11 Remembrance day, Canada.
11 Feast of St. Edmund.
22 St. Cecilia's day.
27 Thanksgiving day, U.S.A.
30 First Sunday in Advent.
30 St. Andrew's day, patron saint of Scotland.

DECEMBER

5 Constitution day, U.S.S.R.
6 Feast of St. Nicholas.
6 Independence day, Finland.
8 Immaculate Conception.
13 Hanukkah (Jewish Feast of Dedication), 1st day.
16 Dingaan's day, Union of South Africa.
21 Solstice (9:44 P.M. Greenwich civil time), beginning of winter.
22 Forefathers' day (also Dec. 20, Dec. 21, Dec. 23), U.S.A.
25 Christmas. Quarter day. English bank holiday.
26 Boxing day. English bank holiday.
28 Childermas. Holy Innocents' day.
30 Rizal day, Republic of the Philippines.
31 Hogmanay.
31 Feast of St. Sylvester.

CALENDAR OF EVENTS · 1951

JANUARY

1 **U.S. house of representatives** completed congressional action on bills imposing an excess-profits tax on corporations and authorizing railroad and air-line union shop agreements.

Communist forces in Korea scored a break-through on the right flank of the U.S. 8th army northeast of Seoul.

2 **U.S. 81st congress** adjourned after completing action on several urgent bills.

Arabian American Oil Co. officials revealed that the company had agreed to divide its profits evenly with the government of Saudi Arabia.

3 **U.S. 82nd congress** convened in Washington, D.C.; Rep. Sam Rayburn was re-elected to a 6th term as speaker of the house of representatives.

Former U.S. Sen. Elbert D. Thomas of Utah was named high commissioner of the Trust Territory of the Pacific Islands.

Pres. Harry S. Truman created the Defense Production administration, headed by William H. Harrison, to centralize various emergency production agencies.

4 **U.N. forces** abandoned Seoul, capital of South Korea, to advancing Communist troops.

U.S. government offered to sell 2 surplus light cruisers each to Argentina, Brazil and Chile.

5 **Sen. Robert A. Taft,** opening a foreign policy debate in the senate, questioned the legal right of Pres. Truman to send additional U.S. troops to Europe without congressional approval.

General chairmen of Brotherhood of Railroad Trainmen and Brotherhood of Locomotive Firemen and Enginemen rejected a previously negotiated national agreement covering railroad operating employees.

6 **U.S. state dept.** announced that Portugal and the U.S. had signed a bilateral military aid agreement within the framework of the North Atlantic Treaty organization.

7 **Legislature of Nepal** authorized the return to Nepal of King Tribhuvana, formation of a cabinet with popular representation and election of a constituent assembly.

Gen. Dwight D. Eisenhower, supreme commander of the military forces of the North Atlantic treaty nations, arrived in Paris for a tour of member countries.

8 **Pres. Truman** in his annual state of the union message to congress accused the U.S.S.R. of seeking to conquer the world and appealed for continued U.S. aid to the free world.

9 **A military committee** of the Allied High commission and a west German committee began discussion of participation of west Germany in the defense of western Europe.

10 **3 U.S. destroyer escorts** were transferred to Italy at Norfolk, Va., under the Mutual Defense Assistance program.

11 **Pres. Truman** asserted at a press conference that he had the right to send U.S. troops anywhere in the world without congressional approval.

U.S. state dept. announced that John Foster Dulles had been named Pres. Truman's special representative, with ambassadorial rank, to conduct negotiations with respect to a Japanese peace treaty.

12 **U.N. convention** on the prevention and punishment of genocide became effective.

Pres. Truman in his annual economic message to congress asked for greatly increased taxes to put the defense program on a pay-as-you-go basis.

British Commonwealth prime ministers stated in a communiqué that agreement had been reached on the urgency of effecting a settlement in the far east, including a peace treaty with Japan.

15 **U.S. supreme court** declared invalid a New York city ordinance requiring preachers to obtain police permits to hold religious services on city streets.

Annual budget submitted to congress by Pres. Truman for fiscal year beginning July 1, 1951, put revenues under existing tax laws at $55,138,000,000 and expenditures at $71,594,000,000, of which $41,421,000,000 was earmarked for military purposes.

National Production authority imposed a 30-day ban on the construction of almost all new commercial buildings.

16 **Board of governors** of the federal reserve system increased the margin requirements on stock purchases and short sales from 50% to 75%.

18 **U.N. and Communist truce delegations** exchanged lists of prisoners of war; Communist list included 3,198 U.S. armed force members, including Maj. Gen. William F. Dean.

National Production authority banned issuance of new automobile license plates in 1953 as a materials conservation measure.

19 **Moscow radio** announced the execution of 2 allegedly U.S.-trained Russian spies said to have been parachuted into southwest Russia from a U.S. plane.

20 **Greece** was elected by U.N. general assembly to seat on Security council by vote of 39 to 16 over Byelorussian S.S.R.

U.N. general assembly voted, 45 to 6, to create 5-nation commission to determine feasibility of holding unification elections under democratic conditions in eastern and western Germany.

21 **10 countries,** including the U.S., Britain and France, renounced peace treaty restrictions on the size and composition of Italy's armed forces.

U.N. general assembly approved, 40 to 5, U.N. 1952 budget of $48,096,789, of which the share of the U.S. was 36.9% and that of the U.S.S.R., 11.49%.

119 men were killed in blast in a coal mine located near West Frankfort, Ill.

U.S. bureau of labour statistics reported that cost-of-living index had risen in Nov. 1951 to record 188.6% of the 1935–39 average.

22 **U.N. command** charged in note to Communists that wide discrepancies had been discovered in Communist prisoner-of-war list turned over to the U.N.

23 **Hungarian government** announced that 4 U.S. airmen forced down in Hungary had been convicted by a military court of violating the Hungarian border.

24 **Independence of new kingdom of Libya** in northern Africa was proclaimed at Bengasi by King Idris I.

King Farouk I of Egypt appointed Hafez Afifi Pasha, prowestern financier, as chief of the royal cabinet.

25 **Iraqi government** nationalized 2 local subsidiaries of the Anglo-Iranian Oil Co.

Senate preparedness subcommittee accused U.S. army of inexcusable waste in the use of manpower.

26 **Appointment** was disclosed of George F. Kennan as U.S. ambassador to the U.S.S.R.

U.S. government announced it would pay $120,000 in fines levied against 4 U.S. fliers forced down in Hungary.

Czechoslovak mission in Tehran revealed that Czechoslovakia would purchase 500,000 tons of refined petroleum from Iran and additional amounts of crude petroleum for refining in Czechoslovak plants.

Communist truce delegation reported that more than 700 U.S. prisoners of war had died, escaped or had been released.

27 **Threatened strike** against steel industry at midnight of Dec. 31, 1951, was called off temporarily by United Steelworkers of America (C.I.O.).

U.N. and Communist armistice delegations failed to reach any agreement, thereby nullifying agreement on cease-fire line made a month before.

28 **4 U.S. airmen** were released by Hungarian authorities after payment of fines by U.S. government.

Yugoslav government announced devaluation of its currency from 50 dinars to the U.S. dollar to 300 to the dollar, effective Jan. 1, 1952.

29 **Production** for first time of useful electric power from atomic energy was revealed by U.S. Atomic Energy commission officials.

30 **Foreign ministers** of Belgium, France, German Federal Republic, Italy, Luxembourg and the Netherlands agreed to propose creation by their countries of a single federal parliament.

31 **United Kingdom** paid $138,527,725.57 to the U.S. as the first instalment on 1946 loan and World War II debt.

Accident Insurance: *see* Insurance.

Accident Prevention. Accidents caused 90,000 deaths in the United States in 1950. This total was exceeded only by deaths from heart disease, cancer and cerebral haemorrhage. Information available through Oct. 1951 indicated that the 1951 accidental death total would be somewhat higher than in 1950. Injuries also probably numbered more than the 1950 total of 9,000,000.

In Dec. 1951 the 1,000,000th traffic accident fatality occurred, the first fatal motor vehicle accident on record having occurred in Sept. 1899.

Organized efforts to reduce accidents in the United States are spearheaded by the National Safety council and affiliated local safety councils throughout the nation. Safety work is constantly carried on by industries and by a large number of organizations, both governmental and private.

Serving as a place for group planning and execution by all who take part in the safety movement, the National Safety council attempts to discover the facts of accident occurrence; devises or helps to devise engineering, educational and enforcement measures for prevention; assists in determining engineering requirements for the safe design, construction and use of machines and equipment; helps to formulate model safety legislation; participates in planning and executing training and educational programs; disseminates this information widely to interested groups and to the general public; and encourages and assists the establishment and functioning of community and state safety organizations.

Industrial Safety.—Building on about 40 years of experience in preventing work accidents, the country's progressive industries continued to pursue thoroughgoing safety measures in 1951, recognizing accident prevention as an important element in efficient operation.

Trade associations and other employer groups emphasized accident-prevention programs in their meetings and publications. Labour organizations recognized accident-prevention efforts as an important element in serving their members. Governmental agencies, such as state and national labour departments, also carried on safety programs as important parts of their operations.

Several hundred members of the committees and subcommittees of the president's conference on industrial safety met in Washington, D.C., in May 1951 to report on progress made on programs agreed upon the previous year.

During 1951 several teams of European industrialists visited the United States to study industrial safety methods and progress. They visited representative industrial establishments, several state labour departments, the U.S. department of labour and the National Safety council.

It appeared, late in 1951, that the year's toll of occupational accident fatalities probably was a little greater than the 1950 toll of 15,500.

Traffic Safety.—As 1951 drew to a close, it appeared that the number of traffic accident deaths would be close to 37,500—the largest annual total since 1941. This increase in deaths was apparently matched by the increase in miles travelled by motor

PLAY YARD designed by a traffic engineer at New Rochelle, N.Y., to teach five- to nine-year-old youngsters the art of survival in an automotive world. Objective: to drive the pedal-powered cars without getting a traffic ticket and being summoned for a hearing in the junior traffic court

vehicles.

A meeting of the president's highway safety conference was held in Washington, D.C., in June. Leading points considered by the delegates were adequate accident records and tighter requirements in the issuance of drivers' licences.

In the 1950 National Traffic Safety contest, which took account of good traffic safety records as well as sound programs in all phases of traffic safety, Pennsylvania received the grand award among states and Wichita, Kan., the grand award among cities.

Kansas also received top place among states in the 1950 Pedestrian Protection contest; Wichita was the winner in cities of more than 100,000 population, and Allentown, Pa.; Waterbury, Conn.; and Fall River, Mass., were given awards among cities of less than 100,000 population.

Awards for outstanding performance in traffic law enforcement in 1950 were granted, among the states, to Rhode Island, Maryland, Massachusetts and New Jersey. City winners, in various population groups, were Los Angeles, Calif.; Washington, D.C.; Minneapolis, Minn.; Oakland, Calif.; Dallas, Tex.; Seattle, Wash.; Dayton, O.; Pasadena, Calif.; San Jose, Calif.; Kalamazoo, Mich.; Columbia, S.C.; Oak Ridge, Tenn.; Dubuque, Ia.; Richland, Wash.; Walla Walla, Wash.; and Ventura, Calif.

Awards for outstanding traffic engineering were given to Connecticut, Virginia, Washington and California among states and Detroit, Mich.; Los Angeles, Calif.; Washington, D.C.; Milwaukee, Wis.; Denver, Colo.; Rochester, N.Y.; Sacramento, Calif.; Fresno, Calif.; Lafayette, Ind.; and Peru, Ind., among cities.

Farm Safety.—Recognition of the seriousness of the farm accident problem is indicated by the fact that in 1951, 26 states had state farm safety committees and 12 states had a full-time farm safety specialist, working through many public and private agencies to spread information on the seriousness of the farm accident problem and ways and means of meeting it.

The president of the United States, for the eighth successive year, proclaimed a National Farm Safety week, in July 1951, which brought about unprecedented attention to the problem of rural accidents. More than 1,100,000 pieces of educational material were distributed, and radio, newspaper and magazine support was outstanding.

School and Child Safety.—Among children 1 to 14 years of age accidents are responsible for almost as many deaths as the next five death causes combined. Even so, the accidental death rate among all children under 15 had dropped nearly 50% in the last 45 years.

School authorities showed increasing recognition during 1951 of the importance of safety education—in the classroom, in shops and in other parts of the school program.

A specialized feature of school safety work had been the driver training programs instituted in many high schools throughout the nation. Studies showed that students who had had this training were involved in fewer accidents than those who had not.

Home Safety.—The 1950 toll of deaths in home accidents was 27,500. Ten months' reports indicate that home fatalities in 1951 numbered about the same as in 1950.

Activity in home safety during 1951 consisted in large part of improved and expanded safety education of people generally, both through the general mediums of public information and specific instructional material. In the latter field, a special kit of home safety materials was produced and made available for use in many communities.

Local and state health departments gave increased attention to accident prevention work, concentrating on home safety. Women's clubs and other organizations and agencies attracting the support and interest of homemakers showed an increasing tendency to include safety in the home as a regular program activity.

Community and State Safety Organizations.—Community and state safety organizations serve in their respective areas to provide leadership in a co-operative effort among all groups and individuals working together for the conduct of safety activities. Control of accidents in any community involves the joint efforts of traffic enforcement and engineering authorities, public information mediums of various kinds, industry, labour, service groups and many others. It is the function of the local safety council to harmonize and co-ordinate these and other safety activities.

During 1951 about 85 of the several hundred local and state safety organizations throughout the country qualified for acceptance as chapters of the National Safety council, this relationship signifying that these organizations fully represented the National Safety council in the communities in which they operated, although at the same time retaining their autonomy.

Safety Meetings.—The 39th National Safety congress was held in Chicago, Ill., in Oct. 1951, with an attendance of approximately 12,000. In addition, about 30 regional safety conferences were held during the year. These meetings brought about an exchange of information, plans and programs among leaders in all fields of safety. (R. L. Fo.)

Canada.—Statistics for 1951 indicated that only 35% of the autos on Canadian highways were safely roadworthy, that $52,000,000 was paid out by insurance companies for accident claims occurring in 1950 and that $61,000,000 was the estimated total for 1951 for such claims. In consequence, auto insurance rates for drivers under 25 years of age went up for 1952 coverage.

There were 299 industrial fatalities in Canada during the first quarter of 1951, compared with 273 for the same 1950 period. The 700 federal-government-sponsored labour-management production committees intensified their accident-prevention programs. Federal authorities arranged a conference of provincial workmen's compensation boards to study ways of providing national and provincial tabulations of industrial accidents on a comparable basis (extent, causes, severity), in order to aid accident-prevention work. (C. Cy.)

Great Britain.—*Road Safety.*—The British government's National Road Safety campaign was continued in co-operation with the Royal Society for the Prevention of Accidents. The year's theme, linked to the Festival of Britain, was "Courtesy." Television and radio items included hints to overseas visitors.

One thousand local road safety committees held an average of 450 meetings a month and co-operated in a national safety week. Monthly statistics were published in the press. In June 1951 road casualties since World War II reached the total of 1,000,000. *Fatal Road Accidents to Children—1950* showed that 1950 had the lowest child fatality total for 25 years. The improved trend continued during 1951.

The Pedestrian Crossings (General) regulations, 1951, came into operation on Oct. 31. Their main provision was for precedence to pedestrians at authorized uncontrolled crossings only, in the vicinity of which waiting or parking of vehicles was restricted. All authorized crossings were painted in zebra (black-and-white) lines.

More than 270,000 drivers were entered in the National Safe Driving competition. Two drivers received the society's award for 32 consecutive years of safe driving. The house of lords debated "The problem of road accidents with special reference to road improvements and maintenance."

Home Safety.—The home office electrical branch reported on 42 fatal home electrical accidents during 1950. Press publicity was given to the danger of leaving children unattended at home.

Recommendations for an adequate fire guard were issued by the Women's Advisory Council on Solid Fuel. A report appeared of an inquiry by the chief scientific advisory division, ministry of works, into domestic accidents relating to building design. The research group of Old People's Welfare was investigating safe furniture designs. An exhibition on home fire prevention was staged jointly by the London County council and the home office. The Ideal Home exhibition included a stand on home safety.

Industrial Safety.—The annual report of the chief inspector of factories for 1949 was published. It stated that reportable accidents fell by nearly 10,000. Accidents to young persons continued to decrease; in 1949 they numbered 9,000 as compared with 24,000 in 1944.

The latest report of the chief inspector of mines (1949) showed reductions in fatal and nonfatal accidents. The chief inspector of factories set up committees to consider safety problems in the use of hydraulic presses and press brakes.

Revised preliminary draft regulations as to safety, health and welfare concerning engineering were published. A memorandum by the senior electrical inspector of factories on the electricity regulations was published for the first time since 1934. (*See* also DEATH STATISTICS; DISASTERS; INDUSTRIAL HEALTH.)

(H. I. S.)

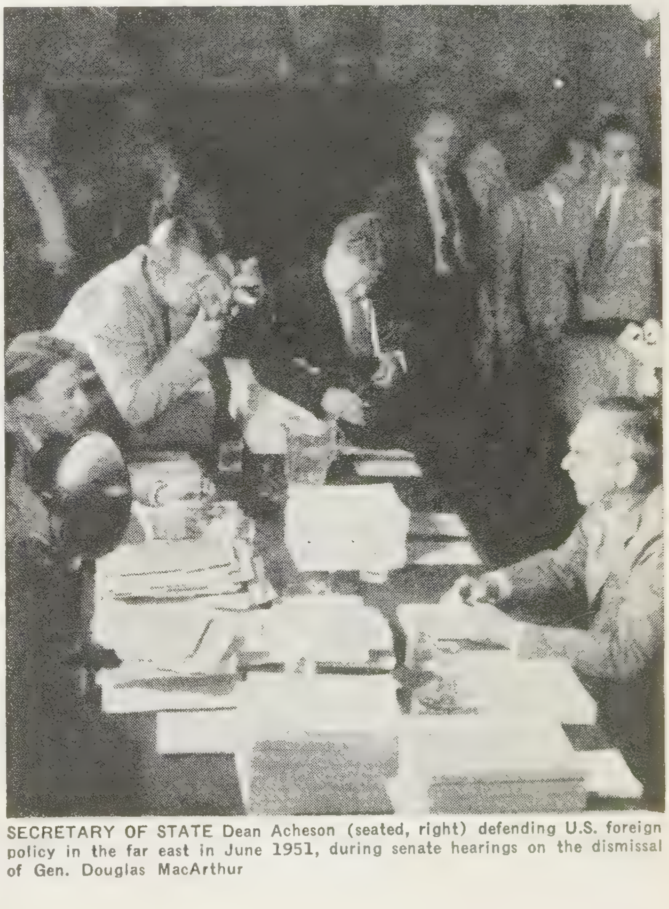
Acheson, Dean Gooderham

(1893–), U.S. secretary of state, was born on April 11 in Middletown, Conn., attended the Groton school and was graduated from Yale in 1915 and from the Harvard law school in 1918. He served in the navy in World War I and was



SECRETARY OF STATE Dean Acheson (seated, right) defending U.S. foreign policy in the far east in June 1951, during senate hearings on the dismissal of Gen. Douglas MacArthur for two years private secretary to Louis Brandeis, associate justice of the U.S. supreme court. He practised law, served for six months as undersecretary of the treasury in 1933, and entered the state department in 1941, first as assistant secretary of state and later (Aug. 1945 to June 1947) as undersecretary. He was sworn in as secretary Jan. 21, 1949.

Acheson was a chief author of the Truman foreign policy, and strongly supported measures for international co-operation, such as the North Atlantic alliance and the United Nations military operations in Korea. Yet because he had been high in government counsels during the wartime and postwar periods when the Soviet Union and international communism gained greatly, he was the continual target of criticism from foreign policy critics within both political parties. Especially after the entry of red China into the Korean war, demands for his resignation grew apace, and Pres. Harry S. Truman repeatedly issued denials that Acheson would leave his post. The storm about him grew hottest after the ouster of Gen. Douglas MacArthur as commander of the U.N. forces in Korea, a move that precipitated a "great debate" over U.S. foreign policy. In hearings before a joint session of the U.S. senate armed services and foreign relations committees, Acheson recapitulated U.S. policy in the far east back to the time of the Yalta conference in 1945. He explained the MacArthur ouster on the grounds that he feared the general's implied threat to bomb and blockade red China would not be supported by other members of the U.N. and that he did not wish to lose them as allies.

Aden.

British colony and protectorates and a free port on the southern coast of Arabia (*q.v.*).

Colony.—Area: 80 sq.mi. (including Perim Island [5 sq.mi.], the strait of Bab el Mandeb and Kuria Muria Islands). Pop.: (1946 census) 80,876; (1950 est.) 82,000.

Protectorates.—Western and eastern, the latter including the Hadhramaut and Socotra Island. Area: 112,000 sq.mi. Pop. (1950 est.): 650,000. Premier chieftain (western): Fadl Abdul Karim, sultan of Lahej; premier chieftain (eastern): Sir Salih bin Ghalib al Qu'aiti, sultan of Shihr and Mukalla. Governors (1951): Sir Reginald Stuart Champion and (from Aug. 3) Tom Hickinbothom.

History.—A conference held in London in Sept. 1950 with representatives of Yemen bore fruit early in 1951 in an agreement to establish diplomatic relations and the appointment of a joint commission to demarcate frontiers. Relations between Aden and Yemen improved greatly in 1951. Nationalist disorders within the protectorate, in which the sultan of Mukalla and the British agent for the western protectorate had been attacked and several rioters killed and wounded in Dec. 1950, did not recur and the year was one of peaceful progress. Excellent progress continued to be made on the Abyan irrigation scheme, under which it was hoped to irrigate about 100,000 ac. of good land, mostly for cotton growing.

Education.—Colony, 4,000 primary scholars; protectorate, 6,500.

Finance and Trade.—Currency: Indian rupee (R. 1=21 cents U.S.); (from Oct. 1951) East African shilling (14 cents U.S.). Budget (1951 est.): revenue Rs. 14,700,000; expenditure (including development) Rs. 20,000,000. Foreign trade: imports (1950) Rs. 42,000,000; exports Rs. 19,000,000. Principal exports of local origin: salt (255,865 tons in 1950) and fish (120,000 tons in 1949). In 1950 the port was used by 4,283 ships (tonnage 17,984,884). (K. G. B.)

Advertising.

The volume of advertising bought in the United States in 1951 was estimated by Robert Coen, McCann-Erickson, Inc., to be approximately $6,500,000,000, an increase of 15% over the amount for 1950. Especial vigour was shown by television, magazines and direct mail as advertising media. Advertising costs continued to rise, but not with the speed of other costs. While the bureau of labour statistics wholesale price index had risen 65% since the end of World War II, it was estimated that the cost of advertising had risen only 23%. This estimate was based upon the use of certain units of newspaper, magazine and radio advertising.

The department of commerce released its summary of data on service trades compiled by the census of business in 1948. There were 3,279 advertising agencies reported that had receipts of $394,872,000, pay roll of $194,342,000 and 38,739 employees.

Television.—Television continued to show phenomenal growth, sets in use by the public on Jan. 1, 1952, being estimated at 14,500,000, compared with 10,000,000 at the beginning of 1951; 3,950,000 in 1950; 1,000,000 in 1949; 189,000 in 1948; and 16,476 in 1947. From a few television stations on the air five years earlier, the number rose to 108, covering 63 major market areas with 60 hours a week of regularly scheduled network programs. It was estimated that 29% of U.S. families had television sets by Oct. 1951.

It was estimated by the Publishers Information bureau that television time charges on the four major networks were $113,834,346 for the first 11 months of 1951. The Columbia Broadcasting system estimated that all television time, talent and other attendant costs amounted to about $355,000,000 in the year.

The growing television market brought higher time and talent costs. In general, stations, and as a result networks, had been revising their time rates approximately every six months, and new cards were expected from the networks by the first of 1952. Basic hourly rates were increased as of Dec. 1, 1951, or Jan. 1, 1952, for stations in the following cities, as examples of the amounts of increase: Birmingham, Ala., from $300 to $400; Chicago, Ill., from $1,600 to $2,000; Detroit, Mich., from $1,000 to $1,500; Jacksonville, Fla., from $300 to $400; Los Angeles, Calif., from $1,500 to $2,000. A station in New York city was expected to boost its basic hourly nighttime price from $4,000 to between $4,500 and $4,700.

Talent-production costs of the average half-hour dramatic telecast in 1951 were up $2,500 to $4,000 above the figure for the same program in 1950, according to an estimate by *Variety*. An hourly television show with top rating paid time charges of $36,375 weekly, or more than $1,000,000 for the 39 weeks, with a talent-production cost of less than $40,000 for each telecast.

A study by the National Broadcasting company showed that the most efficient commercials on television were those that were well liked. Sales messages irritating to the viewer brought only half as many customers to the product for the television dollar as those that were well liked, and the average commercial was liked by 65.1% of viewers, the survey showed.

The National Association of Radio and Television Broadcasters announced that a code of practices for television would become effective March 1, 1952, and that a national review board would be established to investigate complaints against television stations. Nearly half the code was devoted to advertising. It stated that messages were to be presented with courtesy and good taste, that liquor advertising should be rejected and wine and beer accepted only in compliance with local law. Contests and premiums offers should be carefully supervised. (*See* also Television.)

BERLINERS rigged out in "space suits" and helmets to advertise the U.S. motion picture *Destination Moon.* They are shown, in midsummer 1951, pausing at an outdoor café for a stein of beer

Radio.—Radio continued to grow during 1951, the number of radio homes at the beginning of 1952 standing at 42,700,000, a gain of 800,000 during the year. However, radio did not grow so rapidly as television, the number of television homes increasing from 25% of radio homes to 35% during the period.

The increase in the number of radio homes tended to offset the decline in usage of radio sets. However, in 1951 the total home hours of radio usage were approximately 14% below the 1949 level, according to data supplied by A. C. Nielsen company.

In order to meet the competition of television, radio reduced its rates and resorted to other expedients. The Columbia Broadcasting system cut its nighttime network rates approximately 10% in the spring, and the other networks followed with similar reductions.

Advertisers were also given more latitude in buying time on network stations. The National Broadcasting company revised its line-up of stations so that an advertiser was permitted to choose stations based upon the number of homes they reached, rather than upon the old basis of minimum groups designed by the network. The National Broadcasting company also guaranteed that an average of not less than 5,300,000 full one-minute advertising messages would be heard each week on three designated programs at a cost of $2.75 per 1,000. The Columbia Broadcasting system offered to sell advertisers a piece of a particular show, which could be used for special merchandising activities or a special promotion. The advertiser could buy the show in whatever markets he chose and in the weeks he selected.

It was realized that radio still reached more homes that had only radio than those that had both radio and television in the 63 markets where television had extended by July 1, 1951. On that date there were about 13,100,000 radio homes in the area that were not equipped with television sets. And radio still reached areas that did not have television. Moreover, a number of important advertisers returned to radio after an experience in television, and there was considerable interest by advertisers in morning radio programs, and less in afternoon or evening hours. It was also realized that the purchase of a television set did not mean that radios were thrown out, as more families were buying extra radio sets. Moreover, the potential radio audience is greater than that indicated by the number of radio homes. It was estimated that while there were 42,700,000 homes with radios at the end of 1951, there was a total of 105,700,000 sets in use. This included extra sets in homes, and those in automobiles, hotels, bars, stores and in institutions, and portable sets.

The Columbia Broadcasting system estimated that advertising expenditures on the four major networks were $145,745,097 for the first ten months of 1951, a 4.1% drop from the same period in 1950. (*See* also RADIO.)

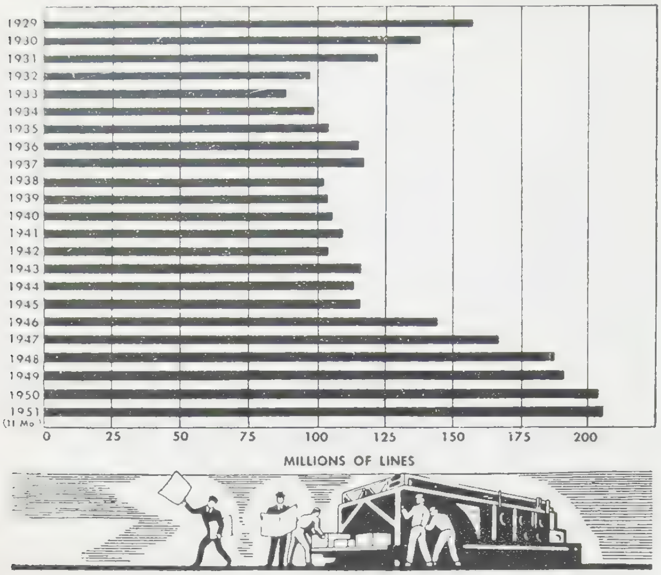
Newspapers.—An estimate by Media Records based upon newspaper advertising in 52 cities showed that total advertising linage was 1.9% higher during the first 11 months of 1951 than for the same period of 1950. The dollar volume of all newspaper advertising in 1950 was more than $2,000,000,000. National advertising linage was down 5.7%, declines being noted in both the general and automotive classifications. Local (retail) advertising showed no change from its 1950 volume. Classified advertising linage increased 14.3%, however, saving the total newspaper advertising figure from a loss. Declines in national newspaper advertising were found in most classifications, laundry soaps and cleansers and alcoholic beverages being the most important classifications revealing gains. Advertising of new passenger cars and of groceries was off. These were the two largest classifications in volume. It was estimated the dollar volume of national newspaper advertising would be close to 1950's figure of $499,000,000, the drop in linage being offset by increases in rates.

The circulation of newspapers continued to increase. A study of newspaper members of the Audit Bureau of Circulations showed that in the six months ended March 31, 1951, circulation of both morning and evening papers was 1.58% higher than for the same period of 1949–50, evening papers having gained 2.15% and morning papers 0.96%. The circulation of Sunday papers was down 0.79%.

In order to determine the effect of television on newspaper circulation, the advertising agency of Geyer, Newell & Ganger studied circulations on Sept. 30, 1950, of 168 newspapers in 62 cities that had television reception. It found that in spite of rapid growth in television, the circulation of these newspapers had risen 2.1% in a two-year period. The 72 morning papers showed a gain of 1.2% and the 96 evening papers an increase of 3.1%.

Magazines.—The volume of advertising in magazines was estimated by the Magazine Advertising bureau to be $508,000,000 for 1951, an increase of approximately 11% over 1950. Actual data for 11 months showed volume at $468,963,000, compared with $422,406,000 for the same period of 1950. These figures cover all general and national farm magazines included in the Publishers Information Bureau service. Sunday newspaper supplements and sections are not included. The 11-months total for magazine advertising was the highest on record.

The circulation of magazines was also at an all-time peak. The average circulation of all magazines that were members of the Audit Bureau of Circulations (excluding comics) was 150,-



NEWSPAPER ADVERTISING (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

638,004 copies an issue during the first six months of 1951, an increase of 2.7% over the 147,300,000 for 1950. This represented a circulation per 100 persons of 98.5. The average single-copy (newsstand) sales an issue were 62,900,000 for the first six months of 1951, compared with 63,600,000 for the like period in 1950.

Magazine advertising costs on a page-per-thousand basis increased approximately 3% for the first six months of 1951 over the preceding year, for both black-and-white and four-colour advertising. During 1951 many magazines announced rate increases, to take effect both in 1951 and in 1952. On the basis of these increases it appeared that magazine advertising costs in 1952 would be approximately 6% higher than those for the first six months of 1951. This would bring them to a level about 12% higher than prior to World War II.

Magazines in Canada also prospered. The Magazine Advertising Bureau of Canada revealed that the average net paid circulation of 13 national magazines during the first six months of 1951 was 132,088 more than for the same period of 1950, and that advertising expenditures in these magazines during the first four months of the year were 22% higher than for the same period in 1950.

Maintaining that it sought to combat a certain degree of natural resistance engendered by a general rate increase and to offset seasonal variations in space sales, *Good Housekeeping* reduced rates for the months of January, February, July and August by 7.5%. Its move was based upon studies of advertising in seven magazines whose advertising revenue in 1950 represented 51% of that of all general magazines. These studies showed decided slumps in advertising income during the four months mentioned. (*See* also NEWSPAPERS AND MAGAZINES.)

Other Media.—The dollar volume of direct mail advertising during the first ten months of 1951 was $878,754,746, according to an estimate by the Direct Mail Advertising association. This represented a gain of 14.5% over the same period of 1950.

An estimate by Outdoor Advertising, Inc., put the national volume of outdoor advertising in 1951 at $90,000,000, a gain of 4.5% over 1950. It estimated that the total volume of outdoor advertising was approximately $120,000,000. There was still a shortage of outdoor advertising space, it being difficult to secure stainless steel for outdoor panels because of war demands. Automotive advertising held up especially well during 1951, but most of the increase during the year resulted from new advertisers using outdoor posters.

Advertising in Other Countries.—An International Advertising conference was held in London, Eng., July 7–13. It was the first international meeting of advertising practitioners since the Wembley conference of 1924. Approximately one-third of the 2,824 delegates were drawn from 38 countries other than Great Britain. The theme of the conference was "The Tasks of Advertising in a Free World." Specific subjects discussed included what advertising could do to help international trade, whether governments should advertise, and how advertising could better help the consumer.

Afghanistan.

An independent kingdom in the centre of Asia, Afghanistan is bounded north by the U.S.S.R., west by Iran, south and southeast by Pakistan and east by China (Sinkiang). Area: *c.* 270,000 sq.mi. Pop. (1950 est.): 12,000,000. Races: Afghans or Pathans or Pashtuns 53%, Tajiks 36%, others 11%. Language: Pashtu or Pakhtu, some Persian. Religion: Moslem. Chief towns (pop. 1950 est.): Kabul (cap., 206,000); Herat (85,000); Kandahar (77,000); Mazar-i-Sharif (55,000). King: Mohammed Zahir Shah; prime minister (from May 1946): Shah Mahmud Khan, the king's uncle.

History.—As in the previous year, relations between Afghanistan and Pakistan were not happy in 1951, because of charges and countercharges regarding border incidents and, on the Pakistan side, particularly because of the alleged encouragement by Afghanistan of the so-called "Pashtunistan" movement.

Under the Point Four program, an agreement with the United States was signed in Kabul in February to assist the Afghan government in the economic development of the country. With India, the Afghan government maintained, through the year, a cordial relationship of which an indication was given by the visit of the Afghan prime minister, Shah Mahmud Khan, to New Delhi in January, when he was entertained by the government of India and a tribute to Indo-Afghan relations was paid by Chakravarti Rajagopalachari, who was then home minister.

The assassination of Liaquat Ali Khan, prime minister of Pakistan, called forth from Kabul a sympathetic message and a tribute to his ability. The Pakistan government on its side was careful to stress the point that, although the assassin was stated to be of Afghan origin, there was no sinister significance in that fact, especially as he had been an exile in Pakistan for some time.

On Sept. 5 the Afghan prime minister, who was paying yet another visit to Delhi, was invited to address members of the Indian parliament, and he reaffirmed his hope that the close and sincere relations already existing between Afghanistan and India would remain for the benefit of world peace. At a press conference Shah Mahmud Khan stressed the friendliness of Afghan policy toward Pakistan, and maintained that in supporting the "Pashtunistan" movement Afghanistan was not animated by hostility to Pakistan. (E. HD.)

Education.—Schools (1948): primary 400, secondary 25, higher 7, teachers' training colleges 2. University at Kabul with four faculties.

Finance and Banking.—Note circulation (March 20, 1950) 845,000,000 afghanis. Monetary unit: afghani, which under exchange rates existing in Nov. 1951 was worth 5.9 cents U.S.

Foreign Trade.—Principal imports: textiles, sugar, china, motor fuel (1949: 4,500,000 gal.), cement (1949: 18,100 metric tons), machinery, tea, coffee and cocoa. Principal exports: karakul skins (1950: $26,000,000), carpets, cotton, raw wool, spices and fruit.

Communications.—Roads (1949) 2,265 mi. Licensed motor vehicles (Dec. 1950): cars 975; commercial 3,735. Telephone subscribers (Jan. 1949): 3,899. Radio receiving sets (1949): 4,800.

Agriculture.—Main food crops: wheat, barley, rice, millet, maize and fruit. Production (metric tons): cotton (1949) 4,000; sugar beets (1950) 33,000; wool (1950) 8,000. Livestock (Jan. 1948): cattle 3,000,000; sheep 14,000,000; goats 6,000,000; camels 350,000; horses 500,000; asses 1,000,000; poultry 40,030,000.

Industry.—Fuel and power: coal (1950) 7,100 metric tons. Raw materials (1949, metric tons) chrome ore 907; salt 10,373; skins and hides (number) 7,250,000.

Agricultural and Industrial Chemistry, Bureau of: *see* AGRICULTURAL RESEARCH ADMINISTRATION.

Agricultural Research Administration.

The Agricultural Research administration, established in 1942, supervises and directs most of the scientific research in the U.S. department of agriculture. The research administrator also administers the Research and Marketing act, which provides for an expanded program of agricultural research and services in which the U.S. department of agriculture, state experiment stations, extension services and departments of agriculture and other public and private agencies co-operate.

Details of a new cotton-opening machine, developed by the bureau of agricultural and industrial chemistry, for fluffing up cotton from the bale in preparation for cleaning and carding, were released to the textile industry. Within nine months, six licences had been granted to machinery manufacturers and textile mills for use of the government-owned patent, and four of the openers were already in operation in cotton mills.

A new vat-fermentation process for the production of vitamin B_{12} concentrate for use in animal feeds was developed by the bureau's northern regional laboratory, which released for general use a more productive microorganism (a strain of *Streptomyces olivaceous*) and directions for using it.

Experiments in co-operation with a manufacturer of wire-bound boxmaking machinery demonstrated that the wood veneer commonly used in wire-bound shipping containers could be replaced by thin, compact panels of strawboard protected on exposed edges with thin strips of sheet iron. The general use of strawboard for this purpose could double the industrial consumption of straw.

In studies concerning rate of growth of twin calves, the bureau of animal industry found that young growing calves fed reduced rations made as economical gains as their identical twin calves fed full rations. Since most of the twins were identical, conclusions were made on considerably fewer animals than would have been needed otherwise.

Two new lines of swine were admitted to the Inbred Livestock Registry association as new breeds. The Landrace-Poland China, designated as Beltsville no. 1, dressed 80% and averaged 49.5% of live weight in the five preferred cuts. The Landrace-Berkshire, designated as Maryland no. 1, dressed 79% and averaged about 50% in preferred cuts.

Experiments showed that the new Silver Cornish chicken was a superior broiler variety, growing as rapidly as a fast-growing strain of New Hampshire and developing a body conformation approaching that of the wide-breasted Dark Cornish.

Evidence was obtained that psoroptic mites (cause of common scabies) of sheep passed from these animals onto a cow in contact with them and readily passed back again to the sheep but did not pass onto calves. Heretofore, it had been commonly accepted that psoroptic mites of sheep were not transmissible to cattle or any other animals.

Records received and tabulated by the bureau of dairy industry showed that cows in dairy-herd-improvement association herds established a new all-time high production average in 1950, when the 1,088,872 cows on test produced an average of 9,172 lb. of milk and 370 lb. of butterfat. The national average of all cows milked in the United States was 5,292 lb. of milk and 210 lb. of butterfat per cow.

In a study to find what relationship, if any, excess amounts of molybdenum in soils had to hyperkeratosis, or X-disease, in cattle, bureau scientists fed sodium molybdate to two calves for 129 days, beginning at 190 and 217 days of age, respectively. Growth rate was reduced materially during the feeding period, and the hair began to turn gray. No symptoms of X-disease were evident, however, and no effect was noted on the blood levels of calcium, phosphorus or phosphatase. The haemoglobin content was lowered.

A process was developed for converting the protein of Swiss cheese whey into a product that could be used in food spreads and as an ingredient in other foods. The new product was called hydrolyzed whey protein. It was made by precipitating the protein from whey, by means of heat and acid, and treating the protein with a commercial enzyme which hydrolyzed it into a smooth, bland, pasty substance.

Early-season application of insecticides in cotton fields not only gave seasonal control of thrips, flea hoppers and bollworms but also speeded up early fruiting and resulted in the production of high-grade cotton. The experiments, conducted by the bureau of entomology and plant quarantine, included three early-season applications of insecticides, with sprays used on 93% of the acreage and dusts on the other 7%. It was demonstrated that this method of control, if applied in the cotton belt, would significantly reduce the amount of insecticide, manpower and equipment necessary to protect the crop from insect attack.

Co-operative experiments demonstrated that impregnating wool cloth with DDT at the rate of 0.3% to 0.4% of the weight of the cloth protected rolls of the cloth in storage for at least three years. Spraying the outer surface of the rolls with DDT spray also provided excellent protection. Special equipment was designed and constructed for spraying rolls of cloth prior to storage.

Extensive tests conducted in Arizona and Montana definitely established the value of aldrin in sprays, dusts or baits and as an insecticide to control grasshoppers. In some of the large-scale aeroplane spraying tests, 95% of the grasshoppers were dead three days after the application. Ground treatments resulted in similarly high kills. No adverse effects on livestock, game animals or birds were observed.

A series of commodity reports begun by the bureau of human nutrition and home economics showed the variation among families in their use of an important food and the effect on purchases of other foods and on the nutritive value of diets when its consumption was relatively high or low. When city families used relatively large amounts of meat, for example, they also used more potatoes but smaller amounts of poultry, fish, milk and certain vegetables and fruits than did families that ate less meat. The meals containing large amounts of meat were higher in protein, iron, thiamine and niacin than those containing little meat. The latter, however, provided more calcium and vitamins A and C. The findings emphasized the advantage of variety and balance in diets for best nutritional results.

In the course of research with rats fed diets short in vitamin E, some of the young were found to develop eye abnormalities of a kind not previously observed in these laboratory animals. Inasmuch as small prematurely born human infants sometimes develop a serious eye impairment which had recently been linked by ophthalmologists with a shortage of vitamin E, the bureau's finding was considered to be useful to those seeking to investigate further the nature, cause and prevention of the infant disorder known as retrolental fibroplasia.

Introductions of plant material from foreign countries by the bureau of plant industry, soils and agricultural engineering included 1,500 fruit and vegetable plants, 3,822 field crop plants and 1,000 specialty crop plants, including 619 that might have value as a source of cortisone.

In research on peach tree diseases, it was found that mild forms of peach mosaic virus arise from the severe forms, and that trees infected with the milder forms are protected against the severe forms from which the milder forms came and are as productive as mosaic-free trees. Mild forms were therefore being inoculated into nursery trees of the important susceptible varieties to protect them against this severe virus disease, which is prevalent in the southwestern United States.

Tests in tung orchards showed the value of high-level applications of both nitrogen and potassium on the oil content of tung nuts. The oil content in nuts of trees fertilized with nitrogen without a correspondingly balanced application of potassium was about 4% below that of trees receiving a high level of both elements. This was a difference of 20% in the oil content.

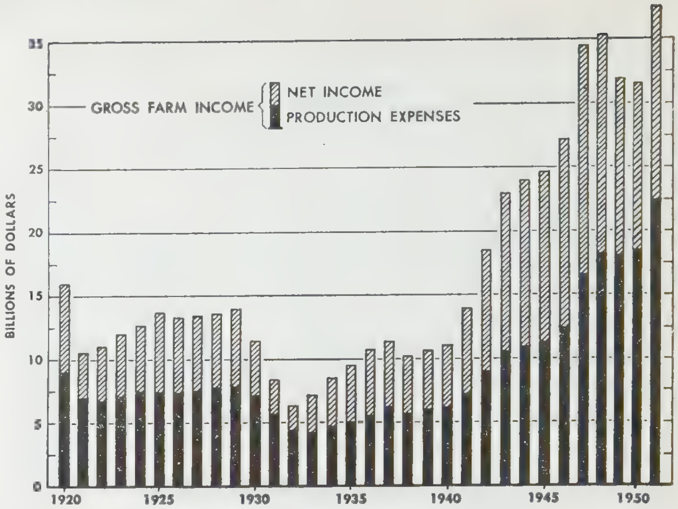
In grain-storage studies it was found that cold air ventilation appeared to be more beneficial than surface stirring to control the accumulation of moisture in surface layers of stored grain. A shelled-corn and small-grain drier, which permitted continuous operation of the heater and fan in each of the two chambers, reduced moisture in corn from 26% to 14% at a cost of two and one-half cents a bushel for fuel and power.

The office of experiment stations, as in former years, was responsible for the administration of federal-grant research funds appropriated to state agricultural experiment stations. The office reviewed and approved 782 new and revised research proposals and reviewed activities under 4,521 specific lines of research under way during the year. The administration of the federal experiment station at Mayagüez, Puerto Rico, remained a further responsibility. (P. V. C.)

Agriculture.

Abundant production by U.S. agriculture in 1951 contributed its major share toward damping inflation in the economy. Total agricultural production was 3% larger than in 1950 and total food production was the same as in 1950, 40% more than before World War II. Food livestock contributed 2% more to the total than in 1950, food crops 6% less.

Highlights of the year were the placing of ceilings on the prices of some foods and agricultural products early in the year; beef became a very prominent item in the public press. Wheat for India was a much discussed matter for months prior to the granting of a $190,000,000 loan to that country in June. Major flood damage in an area centring on northeast Kansas and later great damage by drought and insects to the winter wheat crop of the southern Great Plains, the late-season decline in cotton and corn, particularly the former—all received considerable attention. Yet, in summary, the year was a very favourable one and U.S. agriculture operated at a high level, without, however, many new records and with some developing problems. Incomes were reasonably favourable, but costs to farmers were rising more rapidly than prices. An attack on the parity principle appeared probable. Export markets for some agricultural products appeared to be sustained in considerable degree by grants of U.S. funds or by defense spending. Financial problems in the principal importing countries appeared to be increasing with no easy solution evident. Land values mounted to a level which made it more difficult for farm operators, particularly the young, to become farm owners. At the end of the year, emphasis, official and unofficial, was on an increased level of production in 1952.



GROSS FARM INCOME: net income and production expenses of U.S. farm operators, 1920–51, including government payments beginning in 1933. Compiled by the U.S. bureau of agricultural economics. Data on 1951 are tentative estimates

*Estimates by the U.S. department of agriculture; 1951 figures are preliminary.

Crop Production.—In spite of unusual weather and other problems, U.S. crops in 1951 were the third largest on record, exceeded only in 1948 and 1949. The total volume of all U.S. 1951 crops increased to 139% of the 1935–39 base compared with 134% in 1950, but was, nevertheless, well below the 152% of 1948 and the 147% of 1949. Food grains declined moderately to an index of 144 as compared with 148 in 1950; the harvested wheat crop was less than 1,000,000,000 bu. for the first time since 1943. Feed and hay declined to 160, from 175 in 1950, and for the second consecutive year more corn was used than was produced, in spite of official efforts at expanding production. Only a few crops set new production records: grapes, rice, truck crops for processing, hops and a few of the fruits; hay, soybeans, tobacco, pecans and cranberries were high in relation to previous crops, but not at record levels.

The 52 principal crops for 1951 were planted or growing on a total of 362,207,000 ac., about 9,000,000 ac. more than in 1950; much of the increase was in cotton and wheat, corn increasing only about 1,000,000 ac. But acreage losses prior to harvest were the largest since 1936, amounting to 26,390,000 ac., as compared with 16,732,000 ac. in 1950. Thus the 335,817,000 ac. harvested were 647,000 ac. less than in 1950 and less than any year since 1941.

Yields per acre were relatively high, giving a composite-yield, all-crop index of 143, the same as in 1950 and exceeded only in 1948. New high yields were set for all hay, tobacco, hops, dry beans and sugar beets. Spring wheat, oats, rye, cotton and several of the legume seeds exceeded 1950 but were not new records.

The harvest included 146,500,000 tons of the eight major grains, exceeded in several recent years but more than for any year prior to 1942. Feed grains amounted to only 114,000,000 tons as compared with 122,000,000 tons in 1950, a shortage which was partly compensated by 108,000,000 tons of new hay. The oilseeds outturn of 16,345,000 tons was 7% larger than in 1950 and one-third above average. The tobacco crop was the second largest, the fourth to exceed 2,000,000,000 lb. Sugar beets and white potatoes were about one-fourth less than in 1950; the price of potatoes was not supported.

Deciduous fruits were about 10% more abundant than in 1950 and 6% above average. Truck crops for the fresh market, though above average, were 6% less abundant than in 1950, but vegetables for processing were about 20% more abundant than in the previous peak year, 1946. The cotton crop of 15,290,000 bales was a large one compared with the average or with the 10,012,000 bales in 1950.

Table II.—*Production of Principal U.S. Crops*

(In thousands)

Year	Corn bu.	Oats bu.	Wheat bu.	Cotton bales	Tame hay tons	Rice bu.	Tobacco lb.	Potatoes bu.

1947	2,383,970	1,199,422	1,367,186	11,857	89,286	78,259	2,109,581	389,048
1948	3,681,793	1,493,304	1,313,534	14,877	86,793	85,056	1,980,325	454,654
1949	3,379,436	1,329,473	1,141,188	16,128	87,240	90,549	1,972,359	411,565
1950	3,057,803	1,410,464	1,019,389	10,012	90,325	85,977	2,030,645	429,896
1951	2,941,423	1,316,396	987,474	15,290	95,788	99,791	2,282,386	325,708

The U.S. department of agriculture late in 1951 called for an enlargement of 1952 planted acreage by about 3,000,000 ac. total, with about 7,000,000 ac. more to be devoted to feed crops.

Livestock Production.—Abundant livestock production in 1951 filled some gaps left by lower crop production. Farmers and ranchers in the U.S. increased their cattle herds further during 1951, holding 84,179,000 head at the beginning of the year, as compared with 80,052,000 a year earlier. It was forecast that cattle on farms and ranches at the beginning of 1952 might exceed 90,000,000 head. Meanwhile, during a hectic year of price controls and high cattle prices, enough animals came to market to provide 9,000,000,000 lb. of beef, about 800,000,000 lb. less than had been forecast for the year and 580,000,000 lb. less than in 1950, but nevertheless far more than prewar. The average price paid to farmers for beef cattle in Dec. 1951 was $27.50 per hundredweight, as compared with $25.40 per hundredweight a year earlier.

STACKING CHEESE for storage at a dairy in Monroe, Wis., in 1951

Of the total cattle, 24,579,000 were classed as milk cows and heifers, a figure which had changed only slightly in late years, of which about 22,700,000 were milk cows. And, as in late years, those cows produced milk at a level approximating 120,-

000,000,000 lb. for the year, and perhaps a new record of more than 5,292 lb. per cow. It appeared at the end of the year that supplies of dairy products were ample in 1951 at prices above support levels and below ceilings. In December the dairy products price index was 314, 15% higher than a year before and the highest on record for the month except in 1946 and 1947. However, it appeared that if much expansion should be desired in this sector of the economy it would be difficult to obtain because of an acute labour problem and competition with more profitable agricultural programs. Milk cows had an average farm value of $218 in Jan. 1951, as compared with $177 per cow a year earlier.

There were 65,028,000 hogs on farms at the beginning of the year and a pig crop of 105,818,000 during the year; yet there were indications in late 1951 that a five-year period of expansion in numbers had ended, primarily because of a smaller than hoped for corn crop and an unprofitable corn-hog price ratio of about one to nine late in the year as a result of rising corn prices. About 86,000,000 head were slaughtered during the year, yielding about 11,800,000,000 lb. of pork. However, the pig crop of the autumn of 1951 was only 2% larger than the year before and the December pig crop report indicated that the spring pig crop of 1952 would probably be 9% below that of 1951; hence it appeared that pork production in 1952 would be about 100,000,000 lb. less than in 1951 when the food supply included an average of 73 lb. per civilian. Hog prices to farmers in Dec. 1951 were $17.60 per hundredweight as compared with $17.80 per hundredweight a year earlier.

In spite of the high price for lamb and mutton, sheep numbers on farms made a 4% recovery from record low numbers; the 31,505,000 on farms on Jan. 1, 1951, probably increased further during the year and meanwhile 515,000,000 lb. of lamb and mutton were produced, with 600,000,000 lb. forecast for 1952. Lambs at $28.50 per hundredweight in Dec. 1951 were higher than the $27.60 per hundredweight a year earlier. Wool, domestically and internationally, had an unusual year. Total production in the U.S. in 1951 was about 260,000,000 lb. (grease basis); of that amount, 229,100,000 lb. was shorn wool, with somewhat larger production expected in 1952. Imports of apparel wool for consumption amounted to 325,000,000 lb. during the first eight months of 1951; in 1950, carpet wool in an amount of 315,000,000 lb. was imported. In the latter part of the year consumption was declining; in view of that fact and that world production was estimated at 4,070,000,000 lb., 60,000,000 lb. more than in 1950, it appeared that the greatly reduced world stocks might again build up a bit. The gyrations of wool prices during the year were very rapid and extreme, but U.S. farmers in Dec. 1951 were receiving 62.7 cents per pound as compared with 82.8 cents per pound a year earlier. Great Britain and three other British Commonwealth countries shared profits of £180,000,000 ($504,000,000) made in liquidating the wool stocks of the Joint organization, which in 1946 consisted of 10,500,000 bales.

Poultry played a very significant part in supplying the meat demand of 1951. Approximately 703,000,000 farm chickens, a production of broiler chickens as much as 25% to 30% over the 616,000,000 of 1950, and about 53,000,000 turkeys contributed about 35 lb. of food per consumer during the year, much larger than the total for veal, lamb and fish. Prices were rather low and storage stocks very large, hence there was some anticipation that the tight feed situation would cut production in 1952.

Price controls and slaughter quotas were much-discussed features of the livestock production picture in 1951, and were in force on all meats beginning with Jan. 28, 1951. Price ceilings on beef at wholesale and retail were specified in great detail by cut and grade for various classes of dealers and stores and for various regions. These ceilings in general limited prices of slaughter cattle. In June over-all ceiling limitations were put on slaughter cattle. Ceiling prices on veal and on lamb and mutton were under the general ceiling price regulation; pork prices were generally below ceiling levels.

World numbers of most types of livestock appeared to be increasing. Cattle, estimated at 806,300,000 head, were 2% more than in the previous year and 8% above prewar. Hog numbers, not including many produced and marketed within a year, were a record 297,200,000 head, 6% more than in 1950 and 2% more than prewar. Sheep, estimated at 761,700,000 head, were 4% more than in 1950 and 2% more than prewar. Poultry flocks also increased, but work stock declined slightly.

In terms of meat, a major livestock product, the world total was more than 72,500,000,000 lb. (excluding Asia), 5% more than a year earlier and 6% more than prewar. Of that amount, about 4,000,000,000 lb. entered into world trade, still well below the prewar level. As usual, much of the movement was from the southern hemisphere to western Europe. Great Britain executed new agreements or revisions with three of its main overseas meat suppliers during 1951.

Food Stocks and Exports.—In spite of generally good crops, supplies of some of the major and minor agricultural commodities declined during 1951. This was especially the case as to the storable bread grains and feed grains, but almost as true of butter, cheese and dried milk.

U.S. exports of farm products in 1950–51 accounted for 27% of the nation's total exports and amounted to a value of $3,409,245,000, about 14% more than in the previous year. Exports of cotton ($935,332,000), wheat ($747,570,000) and tobacco ($273,262,000) accounted for 57% of the farm products, by value. The cotton export was the next highest on record. Imports of agricultural products also increased, by 16% to $5,135,584,000, and represented 48% of total imports. Thus agricultural imports, which had exceeded agricultural exports very slightly in 1949–50, went ahead by $1,726,339,000 in 1950–51. Coffee ($1,370,126,000), rubber ($734,265,000), sugar ($412,912,000) and wool ($170,764,000) were the major imports. At the end of the year it appeared that exports would perhaps bulk larger in 1951–52—wheat was moving out at a very rapid rate under the International Wheat agreement, and rather more cotton would move as compared with the previous year.

Farm Product Prices.—The price effects of inflation and inventory accumulation of the latter half of 1950 carried over strongly into early 1951, so that, in spite of comparative abundance of most agricultural products, in mid-Feb. 1951 farm prices stood at an all-time price peak, at 313% of the 1910–14 level and 32% higher than a year before, about 26.5% higher than when the fighting started in Korea and 2% higher than the previous record set in Jan. 1948. Higher prices for meat animals were in considerable part responsible for the strong

FOOD PRODUCTION in the United States, as measured by index number (1935–39=100). Estimates by the department of agriculture; 1951 is preliminary

upturn, though soybeans, cotton, cottonseed, rice and wool, as well as beef cattle, veal calves, sheep and lambs, were at or above probable legal minimum ceiling levels.

Then demand moderated somewhat and favourable prospects began to affect the situation. Prices declined until September to a level 291% of the 1910–14 average, then turned up again, ending the year at 305% of the average, 19 points, or nearly 7%, above the previous December and 58 points, or 23%, above June 1950, taken as pre-Korean war. Prices of all crops had an index number of 280 (1910–14=100) as compared with 258 in Dec. 1950, whereas livestock and livestock products had an index of 328, as compared with 311 a year earlier.

Farm Income.—Estimated gross farm income for 1951 was $37,500,000,000, 14% higher than in 1950. Of that total about $4,700,000,000 was included as the value of home-consumed farm products, the rental value of farm dwellings and government payments to farmers. The remaining $32,800,000,000 was farmers' cash receipts from marketings, also a 14% increase as compared with 1950; of that increase 2% was credited to larger volume of marketings and 12% to higher average prices. Receipts from livestock and livestock products were estimated at $19,500,000,000, 20% higher than in 1950, whereas the estimated total for crops of $13,300,000,000 was only 6% larger than in the previous year. The volume of marketings was slightly larger for both types of products than in 1950. It was anticipated that the volume of marketings would remain large in 1952 and that farmers' cash receipts would probably increase moderately.

Agricultural production expenses also increased from a record $20,000,000,000 in 1950 to $22,500,000,000 in 1951; livestock purchased was about 30% higher; feed expenditures were up about 15%; the total costs of hired labour, fertilizer and interest charges were up about 10%; seed costs and building and machinery depreciation were up 8%; the cost of operating motor vehicles increased 7%; rents were up 5%, taxes 4%.

Thus the farmers' realized net farm income—the difference between gross income and total production expenses—was estimated at $15,000,000,000, up $2,300,000,000, or 18%, as compared with 1950, but substantially lower than either 1948 or the 1947 record of about $17,000,000,000. Prospects were for a modest increase in 1952.

The balance sheet for agriculture in 1951 showed over-all assets totalling $142,775,000,000 as compared with $126,864,000,000 in the previous year. Of that total, real estate made up $72,650,000,000 as compared with $63,527,000,000 a year before. Livestock values increased from $13,184,000,000 in 1950 to $17,517,000,000 in 1951, and the value of machinery and motor vehicles increased by more than $1,000,000,000.

Farm Land Values.—More and more of the inflationary spiral and the generally favourable situation which had existed in agriculture during the past decade were capitalized into land values in 1951. Farm land values increased sharply, about 15% between Nov. 1950 and Nov. 1951, some areas increasing more than one-fifth during that period. The increase, nationally, since the outbreak of the Korean war was about 20%. In comparison with pre-World War II, the national index stood at 249, but it exceeded 300 in eight states. In the later part of the year the market slowed down, few farms were changing hands, a higher percentage of buyers were nonfarmers and a greater degree of caution, even hesitancy, seemed to be developing.

Farm Population and Farms.—Not nearly all the agricultural information to be derived from the 1950 census was yet available in 1951. But the trend toward fewer, larger and better-equipped farms was confirmed. Farms decreased by 713,000 as compared with 1940, from 6,097,000 to 5,384,000; the average-sized farm unit grew from 174 ac. to 210.5 ac. The new definition of farm population excluded residents of institutional farms, about 150,000 in total, and a larger group, about 2,000,000 in all, who lived in houses located on farms, paid cash rent for the house and yard only, without any farm land, and received their income from nonagricultural pursuits. Tenancy declined materially to 27% of the total as compared with 39% in 1940.

Farm Labour.—It was estimated that agricultural employment in 1951 was about 400,000 less than in 1950, partly because of increased mechanization of farming but even more because of the strong drawing power of defense and defense industries in a period of nearly full employment. Hired farm workers make up only about one-fifth of total farm employment, which included in late Sept. 1951 (the normal peak period of farm employment) 13,352,000 persons. However, the average number of workers, Jan. through Sept. 1951, was only 10,350,000, of which 7,971,000 were farm family workers, including the farm operator, and 2,379,000 were hired workers. Wage rates, which were frozen early in the year, were somewhat relaxed under an order permitting up to a 10% increase without special authorization, but nevertheless averaged only about 66 cents per hour cash wages on Oct. 1, about 12% more than a year earlier. As of Jan. 1951, regular hired farm workers were covered under the old age and survivors insurance program of the Social Security act as amended in 1950. It appeared (from 1950 data) that only about 775,000 of the 5,500,000 farm wage workers were regular hands who worked as much as six months continuously on one farm. An additional 600,000 did sufficient farm wage work to make that their chief activity during the year—and 1,600,000 in the course of the whole year did less than 25 days of farm wage work on one or more farms.

The President's Commission on Migratory Labor, which reported in March 1951, dealt with problems of domestic migratory farm workers as well as the use in agriculture of foreign workers. The "wetback" problem, which involved, among other aspects, the apprehension and deportation during 1951 of an estimated 666,000 illegally entered Mexican aliens, was also recognized by congress in public law 78, which provided for the recruitment and transportation of workers from Mexico for employment on farms and in agricultural processing industries only if the secretary of labour certified the need for such labour. Also Mexico and the United States, in signing the Migrant Labor agreement of 1951, acknowledged the necessity of eliminating illegal traffic.

Farm Machinery and Fertilizer.—Production of farm machinery was generally adequate in 1951 but the rate of production dropped very sharply in the latter half of the year and it was anticipated that production would go still lower in 1952 as necessary allocated materials became more restricted. Exports of machinery in the first half of the year were 13% higher than a year earlier. Prices advanced very moderately during the year.

Supplies of fertilizer were somewhat scarce in 1951—below the amounts which farmers would have taken if supplies had been more abundant, and far less than might have been used to advantage in the production effort. During 1950–51 there were record quantities of about 1,285,000 tons of nitrogen fertilizer available to farmers, and the 1951–52 supply was expected to amount to 1,350,000 tons. The phosphate fertilizer supply of 1950–51 amounted to 2,235,000 tons, available phosphoric oxide (P_2O_5) basis. Sulphuric acid scarcity constituted the bottleneck, and a cutback of 8% seemed likely in 1951–52. A record 1,445,000 tons of potash (K_2O) were available in 1950–51. The 1951–52 supply was estimated at an increase of 5%, with larger amounts due in later years as a result of a long-term development which was already under way. Fertilizer prices advanced about 6% in 1950–51 and perhaps 5% more in 1951–52. (*See* also FERTILIZERS.)

Commodity Credit Corporation.—This financing organization of the U.S. department of agriculture made considerable progress in 1951 in liquidating accumulated stocks of grains and other agricultural items acquired as a result of price support operations, mostly in previous years; notably, 1951 white potatoes and eggs were not under support, and prices were sufficiently high in the market during much of 1951 so that government loans on eligible crops were not being requested in large amounts. Such liquidation provided some of the necessary items to keep inflation in check and at the same time moved stocks about to go out of condition. But at the same time a safety reserve of some foods was thereby exhausted. The loss sustained in inventory liquidation in 1950–51 was a record high of about $345,599,000, much of it chargeable to dairy products ($111,000,000), dried eggs ($76,000,000) and potatoes ($63,000,000). As of Nov. 30, $2,028,794,000 was invested in price support program loans and inventories. A net realized loss of $40,550,000 had been sustained in carrying out this program during the first five months of the fiscal year which was to end June 30, 1952. Of the total investment of $2,028,794,000, loans outstanding totalled $795,899,000 (including $244,520,000 of commodity loans held by lending agencies, $503,680,000 held by the Commodity Credit corporation and $47,699,000 of loans approved but not fully processed) while inventories acquired under loan, purchase agreement and direct purchase operations represented an investment of $1,232,895,000. Price support operations in four commodities, wheat, tobacco, cotton and corn, accounted for the bulk of the loan total.

Table V.—*Inventory of the Commodity Credit Corporation, Nov. 30, 1951*

Commodity	Quantity	Cost
Corn	401,516,571 bu.	$630,657,953

"BARNYARD BAZOOKA" (bottom, right) shooting a bale of hay into a barn loft after 1951 harvesting. The machine, operated by compressed air, was invented by F. W. Moffett, Jr., of Idylbrook Farms, Rochester, N.Y.

Items in the inventory of the Commodity Credit corporation as of Nov. 30, the quantities involved and the cost were as shown in Table V.

Commodity Trading.—The Commodity Exchange authority reported that futures trading in 20 regulated commodities had a value of $47,143,639,000 in 1951, as compared with only $32,351,445,000 in 1950. Cotton led with $16,726,624,000; wheat was second with $11,104,823,000; and soybeans, first in 1950, dropped to third place with a value of $8,899,167,000. Speculative limits were put into effect on trades and positions of large traders in soybean and egg futures. Trading in grain sorghums on the Chicago Board of Trade began during the year.

Agricultural Legislation.—As to basic agricultural legislation, 1951 was a quiet year and 1952 gave similar prospects. Amendments to the Defense Production act of 1950 rescinded slaughter quotas and provided a third standard for figuring legal price ceilings of farm products—90% of farm price, by grades, as of May 19, 1951, in addition to the old standards of parity, or the highest price between May 24 and June 24, 1951, with the highest controlling. The same treatment was accorded to manufacturing milk and butterfat, formerly applicable to fluid milk. Authority to control imports of fats and oils was extended until June 30, 1952. No imports of peanuts, butter or other fats and oils (including oil-bearing materials, fatty acids and soap and soap products, but excluding coconuts and coconut products), should be admitted if they would (1) impair or reduce domestic production, (2) interfere with orderly domestic storing and marketing or (3) result in any unnecessary burden of expenditure under any government price support program.

The Sugar act of 1948 was extended to 1956, with some modifications, particularly to increase the quotas of Puerto Rico and the Virgin Islands, beginning with 1953. The secretary of labour was authorized (public law 78) to supply foreign agricultural workers from Mexico to assist agricultural production. The Agricultural Adjustment act was amended (public law 17) to provide for some rearrangement of the national acreage allotment for peanuts.

Other Countries.—In spite of reductions in some areas and some commodities, the over-all agricultural picture in 1951 presented the most favourable situation since World War II. It was a favourable picture in terms of total volume and progress made in increasing production beyond prewar levels, but not particularly encouraging in terms of nutrients available per capita; for, in spite of more fertilizer, more machinery and better control of diseases and insects, population continued to grow more rapidly than the food supply.

Food livestock was at an all-time high, exceeding 1950 and prewar, but less meat entered into international trade than prewar. Milk production increased in practically every producing country, and milk products as well. World egg production was estimated at about 1% more than in 1950 and about 40% more than prewar. The 1951 bread grain crop was a near record one, and carry-over stocks on July 1, though far from record levels, were above average. The world sugar crop was a very abundant one and prices declined rather sharply after June. Supplies of fats and oils, one of the scarcer food items since the war, were sufficiently abundant to result in sharp price declines. The world cotton crop was 23% larger than in the previous year. Tobacco was more abundant in 1951 than in 1950 or prewar. Feed grains were in relatively tight supply in relation to expanding livestock numbers.

*Preliminary estimate.

Vegetables and fruits were abundant, but the world potato crop was about 10% smaller than in 1950 and below the prewar average. Rice was less abundant than in 1950, but slightly above the average of prewar production.

Mediterranean Europe, with a good wheat crop and a record oil crop, fared better as compared with 1950 than other parts of

SHAH OF IRAN (left) handing a land deed to a peasant in the village of Davoudabad. As announced in Jan. 1951, the shah's royal estates, including more than 1,000 villages and surrounding farmland, were being broken up and sold to peasants in small holdings the continent, excepting probably the lower Danube area, which made substantial recovery from the drought of 1950. Not that western Europe suffered any great decrease in production; but the spring was late and wet, sugar beets were off, potato blight took a toll and hoof-and-mouth disease broke out in cattle herds. Prices seemed to be more of a problem than supplies.

In November food supplies in the United Kingdom were at an 11-year low. The British ministry of food announced in December that the retail price of bacon and cheese would be raised tenpence a pound, with a consequent rise of about one point in the index of retail prices and an increase of between fourpence and fivepence per person in weekly expenditure. Apparently this represented a major change in policy trend. The total U.K. bill for food subsidies in 1950–51 came to £400,000,000; that on basic foods amounted to £384,000,000, of which £183,000,000 was paid on imported foods, mainly flour and butter. Welfare cost £36,000,000, and feeding stuffs, fertilizers, etc., £21,000,000. The total of the above was offset by £41,000,000, profits made at sales above cost on the so-called "less essential foods"—canned fruits, coffee, cocoa, dried fruit, egg products and fresh fruit—and also on the sale of oils, fats and sugar to manufacturers and exporters. Long-term contracts were executed with three meat-exporting countries in 1951.

About the agricultural picture for 1951 in the U.S.S.R., little was certain. Some experts thought that food production had not kept up with population increase, that only cotton exceeded the goal and that livestock numbers were low. But by other reports it was a good year. Grains, especially wheat, were probably more abundant than in 1950. In September it was announced that the U.S.S.R. would supply the U.K. with 1,000,000 tons of grain, 200,000 tons of it wheat. Collectives were being merged, 252,000 to become 123,000. Food prices were lowered early in the year.

In the far east the important rice crop was smaller than in the previous year, particularly in China and Japan, though somewhat larger in the surplus areas of southeast Asia. That, plus reports from China and India, appeared to add up to a difficult situation, though statistically the over-all change did not appear more severe than in Europe.

Australia and New Zealand, depending heavily on the livestock industries, appeared to have a favourable market for all exportable surplus, and pastures were good. Nevertheless, there were complaints about rising costs and especially about the very sharp decline in wool prices from, to be sure, record levels. In addition, the sharply lower Australian wheat crop cut supplies below a level from which it was possible to supply all of that country's quota of 87,700,000 bu. under the International Wheat agreement.

Latin America, particularly Argentina and Brazil, had a serious drought problem in 1951, with a result that grain exports were sharply lower; November rains came early enough to mend the situation somewhat. Meat exports were lower, partly because of long inability to agree on price and larger domestic consumption. Coffee moved at high prices. Mexico and Cuba appeared to have done very well in 1951, the latter producing a record sugar crop.

In Africa and the middle east, the year was a favourable one agriculturally, though the situation differed with area and commodity. Peanuts were a large crop in important exporting areas. The North African wheat crop was smaller than in 1950; that of Turkey was one-third larger. The cotton and wool crops were good ones, as was coffee.

Canada produced very large grain crops in addition to a large carry-over of feed grains; hence livestock numbers were increased.

Thus the production of 1951, though abundant, appeared to concentrate supplies to an even greater degree than formerly in North America and to cut supplies in areas normally deficient, at the same time reducing surplus supplies for export in two of three major southern hemisphere areas.

International Agricultural Organizations.—The F.A.O. (Food and Agriculture Organization of the United Nations) moved from Washington, D.C., to Rome, It., early in 1951. Norris E. Dodd continued as director general. The sixth conference of the full membership, held in November and December, emphasized that accomplishments to date had fallen very far below the goals that had been set. It was recommended that over-all targets for increased food production for the next five years be broken down into specific increase goals for each nation. It continued to operate on an annual budget of about $5,000,000, with the membership increased during the year to 70 by admission of Jordan, Spain, Argentina, Japan, Nepal and Laos. Hungary and China gave notice of withdrawal.

The International Wheat Agreement.—The second year of operation under the agreement was completed on July 31, with 41 importing members and 4 exporting members. Japan was added as an importer beginning with the third year. At the beginning of the third year, guaranteed purchases and sales were 581,000,000 bu. (as compared with 456,000,000 bu. in the first year), of which 255,000,000 bu. would come from the U.S., 233,000,000 bu. from Canada, 88,700,000 bu. from Australia and 4,100,000 bu. from France. Sales in 1950–51 were 531,000,000 bu., somewhat short of the 562,000,000 bu. of guaranteed purchases, mostly a result of the fact that a large part of the Canadian 1950 crop was frosted. The U.S. quota was filled four months before the end of the year, and on the 1951–52 schedule slightly more than 200,000,000 bu. of the U.S. total 255,000,000 bu. had been contracted for by the end of 1951.

Thus nearly 60% of the wheat moving in the world market was sold under the agreement. The major problem that had arisen by the third year was one that some had foreseen when the agreement was initiated: it was costing exporting countries approximately 75 cents on each bushel sold because the maximum prices under the agreement, conceived in fear of depression and wheat surplus, were well below world price levels, or even those established by the price support program in the U.S. (*See* also AGRICULTURAL RESEARCH ADMINISTRATION; CENSUS DATA, U.S.; CHEMURGY; FERTILIZERS; FRUIT; HORTICULTURE; IRRIGATION; LAW; LIVESTOCK; METEOROLOGY; PRICES; RURAL ELECTRIFICATION; SOIL EROSION AND SOIL CONSERVATION; VEGETABLES; etc.; and also under principal crops.)

Aircraft Manufacture.

Dominating the United States aviation picture in 1951 was the effort devoted to increasing the country's military air power, particularly the element making up the military aircraft production base. By the year's end, deliveries of completed aircraft to the military services had increased to more than twice the late 1950 production levels. New plants and facilities were completed, and initial deliveries of finished products were beginning to flow from newly expanded production lines. During 1951 the major emphasis was placed on the expansion of productive capacity.

One of the most significant aspects of the mobilization program was the degree of subcontracting undertaken by the aircraft manufacturing industry. In a survey conducted by the Aircraft Industries association in May, it was revealed that approximately 50% of the dollar volume received by the aircraft industry was subcontracted and that of this 50%, approximately 60% went to small business. The survey further revealed that more than 60,000 subcontractors and suppliers were used by the aircraft industry, of which 87%, or about 52,000, were small business firms. Companies later reported additional steps taken to increase the use of outside productive capacity, and the percentage of work distributed to subcontractors and suppliers increased after the May report.

Appropriations in excess of $14,000,000,000 were provided by congress for aircraft procurement during the year. With fiscal 1951 appropriations, the two-year total exceeded $25,000,000,000 and represented more than half of the funds provided by congress for the procurement of military hard goods. This total compares with appropriations of about $35,000,000,000 for the first two years of World War II.

In 1950 it was estimated that about 3,000 military aircraft were produced. Based on reports by the Office of Defense Mobilization and the defense department, a reasonable estimate would place aircraft production for 1951 between 4,500 and 5,000 units.

Although approximately 95% of the aircraft manufacturing industry's efforts in the year were devoted to the production of military aircraft, the demand for commercial transports increased, with unfilled orders for approximately 500 units standing at the end of the year—an all-time high for the industry. Despite the size of the commercial transport backlog, there was a further decline in the number of transports produced during 1951. Only 65 units were delivered to United States and foreign air lines, compared with 91 in 1950. An additional 50 twin-engined executive type transports were produced.

Production of light utility aircraft was materially affected by materials shortages and by the preoccupation of the manufacturers with direct military production activities. About 2,300 light planes were produced during the year, compared with 3,400 in 1950.

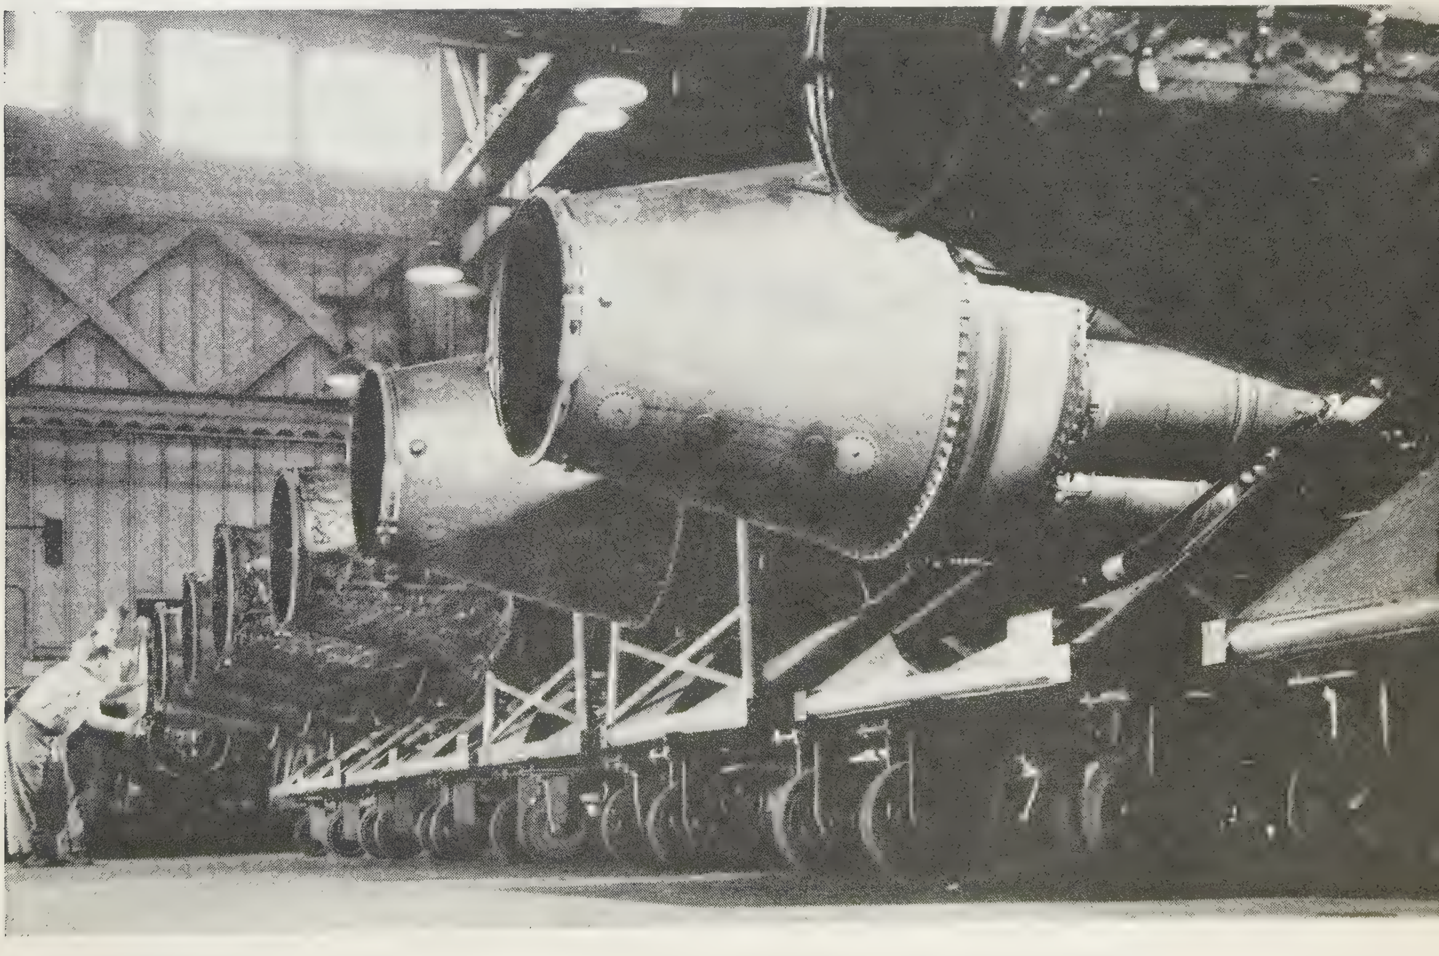
At the close of the year 1951, the aircraft industry—air frame, engine, propeller and parts and components manufacturers—was employing more than 600,000 people. This was more than double its employment at the beginning of hostilities in Korea and compares with the World War II peak of more than 2,000,000 aircraft workers.

The sales volume of the 15 largest air frame, engine and propeller companies was expected to approach $2,500,000,000 in 1951, compared with 1950 sales of $1,809,000,000. This represented an increase of 20% in the year and was the largest volume of sales reported by those companies since World War II.

Despite the increased sales volume, it was anticipated that profits would be substantially less than the $83,500,000 reported by the same 15 major companies in the 1950 period. This was attributable to the effects of the excess profits tax, delivery delays caused by materials and machine tools shortages, the effect of strikes in both primary and component manufacturing establishments, rising wage rates (the average hourly pay which increased from $1.64 in 1950 to $1.80 in Sept. 1951), increased costs of materials and the increased costs of inducting and training new employees.

Several new aircraft with superior performance were placed in production during the year. These planes, which would come off assembly lines in 1952, were the result of many years of intensive research and development activity. They incorporated the latest innovations in components and accessories and were provided with new jet power plants—having thrust ratings far greater than any in use during the year.

One of the most significant developments in aviation in 1951



JET ENGINES for U.S. air force planes in production at Lynn, Mass., in 1951, at the General Electric company's centre for jet engine development, testing and production was the tremendous growth in helicopter activity. Manufacturers of rotary wing aircraft reported backlog in excess of $500,000,000, resulting in unfilled orders greatly in excess of any previous commitments.

During the year, design competitions were undertaken for new interceptors, and engineers began building prototypes of the supersonic fighters of the future. The year also marked the award of contracts to develop nuclear power plants and an air frame capable of using this new power source.

Missile development continued in all categories—air to air, air to surface, surface to air and surface to surface—and the efforts of many years' research and development in the missile field culminated in the award of production contracts for missiles in several of these categories.

Continued expansion of the aircraft manufacturing industry was anticipated throughout 1952. It appeared that fiscal 1953 appropriations for aircraft procurement would exceed $10,000,000,000. It was anticipated that the production rate would exceed a 1,500-planes-per-month level by late 1952, unless unforeseen conditions should intervene.

With transport aircraft backlogs at an all-time peak as the year ended, it was expected that deliveries of these aircraft to United States and foreign air lines in 1952 would nearly triple 1951 figures and would provide the means for further increasing the volume of air travel.

Despite the tight labour supply (especially in skilled technicians) it was anticipated that employment in the aircraft industry, including the parts and components manufacturers, would approach the 1,000,000 mark by the close of 1952. Although aircraft production, measured in terms of units, would not compare with World War II aircraft production when employment was at the 1,000,000 mark, in terms of air-frame pounds the industry's efforts should approximate the World War II record. In this connection it must be remembered that the aircraft of 1951 on the average was more than twice as heavy as its World War II counterpart. Air Races and Records.

In 1951 the National Air races were resumed after an absence of one year, but pilots of the armed forces just about monopolized the big show held at the Detroit-Wayne airport in August. Col. Fred J. Ascani twice exceeded the listed world record on his way to winning the Thompson trophy. Only entry in the final, Colonel Ascani streaked around six pylons over the 100-km. closed course at 628.698 m.p.h. More than 100,000 persons saw the flight of the F-86E jet fighter plane on Aug. 19.

The pilot from the Edwards Air Force base at Muroc, Calif., had been clocked at 635.411 m.p.h. in a qualifying trial, and National Aeronautic association officials submitted that time for consideration as a new world standard for such a course. The recognized mark of 605.230 m.p.h. was set by Douglas Derry of Great Britain April 12, 1948, with a British de Havilland.

Another record fell when Col. Keith K. Compton of the air force captured the Bendix trophy in a transcontinental race against six other jet fighters and bombers. His time for the 1,191-mi. course from Muroc, Calif., to the meet at Detroit was unofficially given as 3 hr. 27 min. 56.4 sec. for a speed of 553.761 m.p.h. Colonel Compton, a test pilot from Florida, flew an F-86 Sabre in surpassing the record made at Cleveland, O., in 1949. Two F-84 Thunderjets followed Colonel Compton in, Col. Emmett Davis of Compton, Calif., just edging out Maj. Gilbert A. Pederson of Arcadia, Calif., for second honours. The race was restricted to members of the armed forces.

CHARLES BLAIR (seated in small plane), first pilot to cross the north pole alone in a single-engined plane. He flew a converted F-51 fighter plane nonstop from Norway to Alaska on May 29, 1951. He is shown arriving in New York city on May 30 after a nonstop flight from Alaska

Eighteen fliers took part in qualifying tests for the $25,000 Continental Motors Trophy race, only event open to civilian pilots. John Paul Jones of Van Nuys, Calif., piloting a plane called "Shoestring," captured the big prize for the second straight time with a record of 197.218 m.p.h. over a closed course of two and one-half miles. Steve J. Wittman of Oshkosh, Wis., was runner-up.

The fifth annual all-Woman Transcontinental Air race (Powder Puff derby) was scheduled to coincide with the National Air races and 44 planes took part in this all-feminine race from Santa Ana, Calif. The winner of this event for light craft is determined on the basis of advertised cruising speed and other factors, with the rules insisting on overnight stops within 30 min. after sundown. First to bring her plane down in Detroit was Mrs. Arleen Davis of Cleveland, flying a Cessna 195. However, in the final tabulation, Claire McMillen of Santa Ana, with Mrs. Frances Bera of Bellflower, Calif., as copilot, was declared the victor. The elapsed time of their Cessna 140 was a little more than 48 hr. Peggy Lennox of Tampa, Fla., finished first in the annual All-Women's International Air race from Orlando, Fla., to Windsor, Ont.

The annual two-day Miami (Fla.) show drew big fields and major winners included the following: George Young, Muncie, Ind., low-wing, executive-type class; Bill Murphy, Miami, Fla., unlimited open class; and Rodney Jocelyn, Langhorne, Pa., national aeronautics class.

With major events in Great Britain, including the King's cup, cancelled, it fell the lot of a bomber pilot to write a page for English aviation history. R. P. Beaumont, 31-year-old World War II ace, streaked across the Atlantic from Aldergrove field at Belfast, N. Ire., to Gander, Nfd., in 4 hr. 19 min. on Aug. 31, eclipsing the former mark of 4 hr. 40 min. Flying a royal air force twin-jet Canberra, Beaumont covered 2,072.79 mi. of the great-circle route at an average speed of 480.2 m.p.h. (T. V. H.)

A.L.A.: *see* AMERICAN LIBRARY ASSOCIATION.

Alabama. Alabama, "the heart of Dixie," was admitted to the union as the 22nd state on Dec. 14, 1819. It is bounded on the north by Tennessee, on the east by Georgia, on the south by Florida and the Gulf of Mexico and on the west by Mississippi. Called the "Cotton state" or the "Yellow-Hammer state," its area includes 51,078 sq.mi. of land and 531 sq.mi. of water.

The 1950 census gave Alabama a population of 3,061,743, compared with 2,832,961 in 1940. Of Alabama's total population, 43.8% is defined as urban and 56.2% as rural. Birmingham, with 326,037 people, is the largest city. Mobile is second, with 129,009. Montgomery, the state capital, has 106,525 citizens. Other large cities include Gadsden, 55,725; Tuscaloosa, 46,396; Bessemer, 28,445; Anniston, 31,066; Dothan, 21,584; Decatur, 19,974; Huntsville, 16,437; Phenix City, 23,305; Selma, 22,840.

The principal elective officials, who serve four years, included in 1951: Governor, Gordon S. Persons; lieutenant governor, James B. Allen; attorney general, Silas Coma Garrett, III; state auditor, John Brandon; commissioner of agriculture and industries, Frank M. Stewart; secretary of state, Mrs. Agnes Baggett; state treasurer, Sibyl Pool; state superintendent of education, W. J. Terry.

History.—Governor Persons took office on Jan. 16, 1951. On Feb. 2, Persons abolished the use of the lash in Alabama's 35 correctional institutions. During his first year in office, he succeeded in increasing the 1% sales tax to 3%, the revenue to go to education; obtained a $3 car licence tag, effective in 1953; put through a $25,000,000 road bond issue, in a state vote. On Dec. 11, 1951, Alabama voters rejected a plan to reapportion the state legislature, with each of the 67 counties to have a senator, instead of the existing 35 upper-house members. A new voter qualification law was approved by 369 votes in a ballot that attracted 120,345 voters. Although the new voter registration amendment made no mention of race, creed or colour, many contended that it was aimed at Negro voters. It required prospective voters to be of "good character"; to embrace the "duties and obligations of citizenship"; to fill out a written questionnaire; and to sign an anti-Communist oath. The various county boards of registrars were to administer the law.

Education.—During the academic year 1950–51 (ending June 30, 1951) the total number of public schools in Alabama was 3,258. Total enrolment was 681,007. Of this number, 443,255 were enrolled in elementary schools and 237,752 in high schools. There were 13,332 elementary school teachers and 8,908 high school teachers. There were nine state-supported institutions of higher learning.

In the school year 1950 there were 43,120 students enrolled on college campuses and a teaching staff of 1,828. Of these, 7,739 were Negroes, with teachers numbering 160. The total on- and off-campus enrolment, including attendance at the university centres, was 62,481, with 2,092 teachers. Of this enrolment, 8,879 were Negroes, with 256 Negro teachers. There were 12 denominational and private colleges, with approximate enrolment of 21,084.

Social Insurance and Assistance, Public Welfare and Related Programs.—Amounts spent for public assistance categories in Alabama during the 1950–51 fiscal year (ending Sept. 30, 1951) and average number of recipients (in parentheses) during 1950–51 were as follows: old-age assistance, $20,154,623.17 (81,082); aid to the blind, $414,186.50 (1,550); aid to the handicapped, $2,118,047.43 (8,310); aid to dependent children, $7,558,537.67 (18,649); aid to children in foster care, $177,075.78 (526); temporary aid, $26,905.71 (92). During the fiscal year 1950–51 $30,449,376.26 was paid to 110,209 persons in the various aid phases. Alabama's prison population on Oct. 1, 1951, the end of the fiscal year, was 4,312. Total expenditures for the department of corrections and institutions were $3,819,466.49.

Communications.—The state highway system included 7,805 mi. of road. The county systems had 52,763 mi., and there were approximately 4,000 mi. of municipal streets. For 1950–51, state highway department expenditures for roads were $25,320,020.90. The estimated railroad mileage was 5,000. The state had 455,000 telephones. There were 101 public, commercial and private airports, 2 government fields (Tennessee Valley authority) and 16 that belonged to the air force and navy. Included were 1,394 mi. of controlled airways and 1,903 mi. of off-airway carrier routes.

Banking and Finance.—On June 30, 1951, there were in Alabama 155 state banks and 1 branch, with total deposits of $286,282,450.56. Total resources were estimated at $314,768,040.77. There were 70 national banks, 20 branches and 1 facility, which had total deposits of $938,194,000 and total resources of $1,015,464,000. On Dec. 30, 1950, 8 Alabama savings and loan associations had resources of $11,956,397.92. On the same date there were 64 credit unions with total resources of $156,797.31.

Agriculture.—Alabama's total principal crop value in 1951 (exclusive of livestock, swine and poultry) was $336,300,000, an increase of 15% over 1950. The cotton crop (lint and seed) grossed $193,000,000 compared with $133,000,000 in 1950; peanuts grossed $19,000,000 in 1951. The estimated over-all value of Alabama agricultural production ranged from $425,000,000 to $450,000,000. Income to Alabama farmers from cattle sales was expected to be about $50,000,000, compared with $38,000,000 for 1950; poultry, $30,000,000; dairy products, about $26,000,000.

Table I.—*Leading Agricultural Products of Alabama*

	1951	1950	Average 1940–49
Cotton, bales	920,000	575,000	919,000
Cottonseed, tons	359,000	225,000	355,000
Corn, bu.	46,303,000	56,954,000	46,983,000
Peanuts, lb.	202,320,000	324,950,000	310,160,000
Hay, tons	556,000	641,000	750,000
Sweet potatoes, bu.	1,365,000	3,150,000	5,376,000
Irish potatoes, bu.	4,216,000	3,712,000	4,186,000
Oats, bu.	2,052,000	2,938,000	5,055,000
Soybeans, bu.	1,584,000	1,387,000	468,000
Sorghum grain, bu.	323,000	595,000	632,000

Source: U.S. Department of Agriculture.

Manufacturing.—In 1950, 5,041 Alabama manufacturing establishments, with an active value of $529,000,000, employed 226,000 persons. Income from pay rolls and profits was $888,000,000; cost of materials and service was $1,636,000,000; sales or receipts totalled $2,524,000,000. The primary metals industry employed 47,000 workers, with sales or receipts totalling $672,000,000. Textiles employed 55,000, with sales or receipts totalling $548,000,000; lumber, 42,000 workers with sales or receipts, $205,000,000; food products, 15,000 workers, with sales or receipts, $287,000,000. (B. BT.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in the state in 1949 the values of which exceeded $100,000, and the corresponding data for 1950, so far as they were available at the close of 1951. Alabama ranks third among the states as a producer of iron ore.

Table II.—*Mineral Production of Alabama*

(In short tons, except as noted)

Mineral	1949 Quantity	1949 Value	1950 Quantity	1950 Value
Cement (bbl.)	9,394,348	$20,320,658	10,574,955	$23,175,772

Åland Islands: *see* FINLAND.

Alaska. Alaska, the northernmost territory of the United States, is separated from Siberian U.S.S.R. by the Bering strait. The boundary line follows the international date line between Big Diomede Island, which is soviet soil and in the eastern hemisphere, and Little Diomede Island, which is on the U.S. side in the western hemisphere. These islands are about three miles apart. Alaska has an area of 586,400 sq.mi. Its population according to the 1950 census was 128,643, compared with 72,524 in 1940. The gain of 77.4% in the ten-year period did not include the military, naval or coast guard per-

ALASKAN COLONY FARM at Matanuska. As a federal resettlement project, the colony was begun in 1935 as a tent town of 202 families. By 1951 the population was 4,500 and there were 12,000 ac. in production

sonnel stationed in the territory. The bureau of the census estimated the population as of July 1, 1951, at 136,000. The Aleutian Islands, a chain of small islands extending about 1,200 mi. westward from the extremity of the Alaskan peninsula, constitute part of the territory of Alaska. The largest town is Anchorage, with a 1950 population of 11,060. Other towns and their preliminary 1950 populations were as follows: Juneau (5,818); Ketchikan (5,202); Petersburg (2,291); Sitka (2,080); Kodiak (1,625); Wrangell (1,227); Seward (2,063); Nome (1,852); Fairbanks (5,625); Seldovia-Homer district (1,526). Chief officers of the territory in 1951: Ernest Gruening, governor since 1939; Joseph W. Kehoe, secretary of Alaska. Elected by the people: E. L. Bartlett, delegate in congress; Henry Roden, territorial treasurer; Frank A. Metcalf, highway engineer; J. Gerald Williams, attorney general; Henry Benson, commissioner of labour.

History.—The most significant event occurring in Alaska during 1951 was the announcement of construction of a $40,000,000 pulp mill near Ketchikan. This basic forest industry was expected to do much to stabilize the economy of the southeastern region, which had been of a seasonal character, based on salmon and halibut fishing. Construction plans for Alaska's first plywood mill, at Juneau, also were announced.

Construction activities reached a new peak in 1950, the total program being estimated at $500,000,000. Although the bulk of activities centred on defense installations, numerous projects important to development of the territory were undertaken. Construction commenced on Alaska's first large hydroelectric plant (30,000 kw. installed capacity) at Eklutna, near Anchorage. Great strides were taken toward alleviating the critical housing shortage with the erection of numerous apartment buildings in Anchorage, Fairbanks, Juneau, Ketchikan and other communities. Paving of the interior highway system continued throughout the year. New road construction included the linking of Anchorage with Seward on Kenai peninsula by a 128-mi. highway. (*See* also FORESTS.)

Education.—Alaska in 1951 had 27 high schools with 2,363 pupils and 207 teachers. The elementary schools, 73 in number, had an enrolment of 12,234 and 543 teachers. For native children the Alaska native service, a division of the department of the interior, maintained 93 day schools and 3 boarding schools with an enrolment of 5,407.

Banking and Finance.—The territory had a net cash balance of $4,331,687.97 as of Dec. 15, 1951. Alaska has no bonded indebtedness and operates on a cash basis. Funds of the territory were deposited in the 17 territorial banks and 5 national banks located within Alaska.

Fisheries.—Alaska's salmon pack, considered the largest in the world, totalled 3,473,592 cases in 1951 with a value of about $90,000,000. The halibut, shrimp, crab and cod fishery brought the total value of the seafood pack of the territory up to more than $110,000,000 for the year.

Agriculture.—The total value of production was $2,186,000, of which $1,275,000 came from the Matanuska valley. Tanana valley accounted for $496,000, Kenai peninsula $66,000 and southeastern Alaska $349,000. Dairy products were valued at $997,000, vegetables $528,000, poultry $329,000, livestock $177,000 and fur farms $125,000. A total of 1,061 ac. of new cropland was cleared during the year. (ER. GR.)

Mineral Production.—The table shows the tonnage and value of mineral production in the territory in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the close of 1951.

Mineral Production of Alaska

(In short tons, except as noted)

Mineral	1949		1950	
	Quantity	Value	Quantity	Value
Coal	433,533	$3,309,303	412,455	$3,033,445
Gold (oz.)	229,416	8,029,560	289,272	10,124,520
Sand and gravel	?	*	3,050,020	2,377,407
Tin concentrate	57	114,800	?	*
Other minerals		4,096,009		2,463,000
Total		15,549,672		17,798,000

*Value included with other minerals.

Albania. A people's republic in the western Balkans, Albania is bounded north and east by Yugoslavia and south by Greece, with an Adriatic coast line of 200 mi. Area: 10,629 sq.mi. Pop.: (1930 census) 1,003,097; (mid-1950 est.) 1,200,000. Language: literary Albanian and two dialects, Gheg north of the river Shkumbi and Tosk in the south. Religion: Moslem 65%, Greek Orthodox 23%, Roman Catholic 11%. Chief towns (1949 est.): Tiranë (cap. 40,000); Scutari or Shkodër (30,000); Koritsa or Korçë (28,000); Elbasan (18,000). Chairman of the presidium of the people's assembly, Omer Nishani; prime minister, Gen. Enver Hoxha.

History.—The theme that ran through events in 1951 was isolation. The main preoccupation of the Communist government was with real or imaginary attempts to overthrow a regime apparently cut off from outside help. The soviet government continued to exploit to the best of its ability Albania's natural resources without committing itself to Albania's defense. In the capital numbers of soviet advisers and technicians were to be seen and the soviet press gave considerable publicity to Albania, but no moves were made to sign a soviet-Albanian mutual defense treaty.

Throughout the year state security was emphasized. The most striking news to reach the outside world (although not officially confirmed) was the reported explosion of a time bomb outside the soviet legation in Tiranë on Feb. 19. The explosion apparently did little damage and casualties were few, but the incident was followed by the arrest of between 300 and 400 Albanians, of whom 40 were executed immediately without trial. Shortly afterward, on Feb. 25, the government issued instructions calling for a ten-day intensive campaign against elements hostile to the regime and ordering the immediate surrender of all firearms and close-combat weapons.

The government frequently announced the death or capture of "enemy agents" who had allegedly entered Albania illegally on instructions from western governments; these amounted to 65 during the year. At the same time, Albania maintained its hostile attitude to Yugoslavia, Greece and Italy, dispatching frequent protests against alleged violations of Albania's frontiers and air space.

In this uneasy situation the Albanian government pressed on as best it could with the economic and social measures outlined in the two-year plan. The government's agricultural policy, proclaimed at a session of the central committee of the Albanian Workers' (Communist) party on April 12 as further development of the collectivization of agriculture, was reversed at a second meeting of the committee on May 14. A warning was then issued against undue haste, and the party's policy was laid down as consolidation of results so far achieved. The government continued to make exaggerated claims to industrial progress, and on Sept. 26 it announced the introduction of a new five-year plan based on soviet experience.

Major changes in the Albanian cabinet during the year were: in March Spiro Spano, one of the deputy premiers, was dismissed; in September Mehmet Shehu, member of the Politburo of the Albanian Communist party, deputy premier and minister of the interior, was relieved of all his duties and succeeded by Iosif Pasko.

An interesting development was the decree published on Aug. 3 of a new statute for the Albanian Roman Catholic Church. Under this decree, the church was required to break off all relations with the Vatican and to conduct its external relations through the Albanian government.

Albania's diplomatic representation in western Europe was restricted to legations in Italy and France. The negotiations between Great Britain and Albania over compensation for the loss of two British destroyers and 44 British lives in the Corfu channel mining incident of 1947 continued during the year, but no settlement was reached. (M. MACK.)

Education.—Schools (1949): elementary 1,910, pupils 162,000; higher elementary 145, secondary 20, total pupils 19,140. A teachers' college was opened at Tiranë in 1946.

Finance.—Monetary unit: lek, until mid-1948 at par with Yugoslav dinar, with an official exchange rate (Nov. 1951) of 139.25 leks to the pound sterling and 49.6 leks to the U.S. $1.

Transport and Communications.—Roads (1949): 1,766 mi. Licensed motor vehicles (Dec. 1950): cars 500; commercial 1,200. Railways (1950): 26 mi. Shipping (1949): merchant vessels 6. Post and telegraph offices: 53. Radio receiving sets (1950): 40,025.

Agriculture.—Main crops (metric tons): wheat (1947) 54,000; maize (1947) 140,000; olives (prewar) 17,000; grapes (prewar) 14,000; potatoes (1949) 4,000; tobacco (1945) 1,500. Livestock (1946 est.): cattle and buffaloes 371,000; sheep 1,700,000; horses 50,000; pigs 35,000; goats 854,000; asses 40,000; mules 10,000.

Industry.—Crude-oil production (1950): 150,000 metric tons.

Alberta. The most westerly of the three prairie provinces of Canada, Alberta was created by parliament in 1905. Area: 255,285 sq.mi., of which 6,485 sq.mi. are water; pop.: (1941) 796,169, (1951 prelim. census) 936,556. Largest city: the provincial capital, Edmonton, (1951 prelim. census) 158,709; metropolitan area, 172,112.

History.—Spectacular oil development, expanded provincial revenues and general buoyancy marked the year 1951 in Alberta. The legislature sat from Feb. 22 to April 7, and its major new enactments included the prohibition of aerial photographic surveys of natural resources without provincial permit; the bringing of all the cities of the province under one law (instead of separate charters); the preparation for emergencies with a new civil defense and disaster act; and the extension of extra financial aid to municipalities. Amendments were made to existing laws respecting natural resources, agriculture, highway accidents, co-operatives, irrigation, public utilities, education and nearly 90 other items within provincial jurisdiction.

When the federal government dropped rental controls, the province took over by working out a plan of landlord-tenant cooperation in setting rents, with a rental board to arbitrate disputes. The federal government sent an expedition to survey the northern British Columbia-Alberta boundary.

Education.—By Sept. 1951 nearly $16,000,000 had been loaned by the provincial government to boards of education after the School Borrowing Assistance act went into force in 1950. The latest available revised statistics for provincially controlled schools were for the year ending 1948: total enrolment, 156,629; average daily attendance, 133,410; teachers, 5,559; total revenues, $22,381,830.

Highways.—An $18,500,000 program of main highway construction, and improvement to 1,000 mi. of existing roads, got under way during 1951, including $4,000,000 to be spent on the Alberta section of the Trans-Canada highway.

Finance.—The provincial budget for the 1951–52 fiscal year was: revenue, $94,223,090; expenditure, $93,969,610; surplus, $253,480. Provincial revenues from oil royalties, leases and development rights had, by Nov. 1951, reached a total of $110,750,000. On Sept. 30, 1951, the funded provincial debt was $97,992,487 (1936: $167,000,000).

Agriculture.—Heavy September snow and freezing rain cut the wheat crop by an estimated 10,000,000 bu. and the oat crop by 15,000,000 bu., from estimated yields of 168,000,000 and 129,000,000 bu., respectively. During the summer there had been an unprecedented 62 days of hail, causing $30,000,000 damage. In 1950 the value of all agricultural production was set at $510,973,000.

Manufacturing.—Industrial expansion was estimated at $100,000,000 for 1951 (1950: $40,000,000). Involved, in the Edmonton area, were oil refineries, a pulp and paper mill and a cellulose acetate plant.

Minerals.—In the first eight months of 1951, 862 oil wells and 23 gas wells were completed. By October there were 2,667 active oil wells in the province, with a peak daily flow in mid-October of 176,427 bbl. During the first ten months of 1951 production was 38,203,896 bbl. of crude. (C. CY.)

Alcohol, Industrial. The end of 1951 found industrial alcohol in good supply, with prices at 89½ to 91½ cents per gallon, basis pure in cars. One major producer established a contract price for early 1952 of 75 cents per gallon, subject to quarterly adjustment. Some denatured synthetic production was approximately $1 per gallon.

U.S. production during the year 1951 was 444,935,011 proof gal., as compared with 313,535,129 proof gal. in the previous year. Stocks were much larger than a year previous; as of June 30, 1951, they were 99,684,133 proof gal., as compared with only 23,247,967 gal. a year earlier. (J. K. R.)

Alemán, Miguel (1903–), president of Mexico, was born on Sept. 29 in Sayula, Veracruz, Mexico. He studied at the National Preparatory school in Mexico City and later at the National University of Mexico, also in Mexico City, where he received his law degree in 1928. He was successively consulting attorney for the Mexican ministry of agriculture; judge of the federal court; senator from Veracruz; governor of that state (1936–40); and minister of the interior under Pres. Manuel Avila Camacho, whom he succeeded as president in 1946. He was the republic's first civilian president since Francisco I. Madero, who served from 1911 to 1913.

During World War II and afterward, Alemán championed inter-American solidarity, while vigorously pursuing a domestic program emphasizing education, industrialization, irrigation and the modernization of agriculture, source of income for 70% of Mexico's population. In March 1951 when 3,500 striking coal miners reached Mexico City, he offered them food, camping facilities, medical attention and transportation to their homes, provided that they would accept non-Communist leadership of their union.

Under his presidency Mexican finances improved to the point that it was reported early in 1951 that Mexico would not ask further loans from the U.S. Alemán discouraged some of his followers in congress who wished to amend the constitution so that he might succeed himself in the 1952 elections.

Algeria. A French territory of North Africa, Algeria is situated between Morocco (west) and Tunisia (east), with a status of government-general of the French union. Total area: 846,124 sq.mi., administered in two parts: northern Algeria (80,966 sq.mi.), comprising the overseas *départements* of Algiers, Oran and Constantine; and the four territories of southern Algeria (765,158 sq.mi.). Pop.: (1936 census) 7,234,684; (1948 census) 8,676,016, including 816,993 (9.4%) in the southern territories; (1950 est.) 8,900,000. Arabs and Berbers, who are Moslem, constitute 86.7% of the population; Europeans (1936) 987,252, predominantly Roman Catholic; Jews (1949 est.) 130,000. Administration: Algerian assembly, 120 members elected by two colleges; in the first college, citizens of French status and Moslems distinguished by military, university, administrative or judicial qualifications; in the second, all other Moslem citizens. The assembly manages Algerian affairs in agreement with the governor general, who has wide powers.

Chief towns (1948 census): Algiers (cap., 315,210); Oran (256,661); Constantine (118,774); Bône (102,823); Tlemçen (69,668). Governor general: Roger Leonard.

History.—The elections on June 17, 1951, to the national assembly in Paris were notable for the total victory, in the second college, of the moderate independents over the nationalists of the Mouvement pour le Triomphe des Libertés Démocratiques (M.T.L.D.), autonomists of the Union Démocratique du Manifeste Algérien (U.D.M.A.) and Communists. In the first college, victory went to the independents and the Rassemblement du Peuple Français (12 seats against 1 Socialist and 2 Communists). Similar results had attended the elections to the Algerian assembly in February and were to attend those to the general councils (of the three *départements*) in October; in the latter the M.T.L.D. and the U.D.M.A. did not take part, alleging pressure by the authorities. On Aug. 5 these parties formed an Algerian freedom front (Front Algérien de la Liberté) with the Communists and the religious movement of the ulemas. New communes, with elected municipal councils, were set up.

The yearly increase of population reached 150,000, the number of departures for France 85,000. Output of citrus fruits, livestock, minerals and industrial produce was higher.

Education.—Schools (1949): primary 2,188, pupils 331,700; secondary 128, pupils 23,400; technical, pupils 3,000; University of Algiers, students 4,977.

Finance.—Budget (1951–52 est.): balanced at 72,000,000,000 fr. Currency: Algerian franc = metropolitan franc, with an exchange rate of 350 to the U.S. dollar in Sept. 1951.

Foreign Trade.—(1950) Imports 983,000,000 fr.; exports 112,232,000,000 fr. (including 82,279,000,000 fr. to France).

Transport and Communications.—(1950) Railways 4,500 km.; state roads 8,500 km.; secondary roads 26,000 km.; tracks in the Sahara 11,000 km. Motor vehicles licensed: 173,000. Ships entered: Algiers 3,621; Oran 2,660. Aircraft landed: 10,792.

Agriculture.—Main crops (metric tons, 1950): wheat 1,030,000; barley 780,000; oats 150,000; citrus fruits 250,000; olives 100,000; figs 50,000; dates 20,000; potatoes 210,000; vegetables 450,000; tobacco 19,000; wine 14,000,000 hl. Livestock (1950): cattle 766,000; sheep 4,500,000; goats 2,900,000; horses 220,000; asses 330,000; mules 230,000; camels 120,000.

Industry.—Mineral production (metric tons, 1950): coal 250,000; iron ore 2,572,000; phosphates 585,000; zinc 16,000. Industrial production (metric tons, 1950): cement 324,000,000; superphosphates 90,853,000; paper 12,000,000; pig iron 5,900,000; copper wire 3,500,000; matches 181,000,000 boxes; electricity 500,000,000 kw.hr. (HU. DE.)

Aliens. **United States.**—In spite of a definite interest in U.S. naturalization, evidenced by larger citizenship classes and more applications for declarations and petitions, the actual number of persons naturalized (54,716) was low in 1951—lower than in any year since 1910. Of the 54,716, only 14,864 were naturalized under the general provisions of the nationality law. Two-thirds of those who received certificates were persons married to citizens who were not required to file petitions, and 975 were military naturalizations, also not requiring declarations.

Principal Countries of Former Allegiance of Persons Naturalized in U.S.

Former nationality	Years ended June 30 1951	1950	1949	1948	1947
British	10,867	12,697	13,284	12,361	20,328

Total	54,716	66,346	66,594	70,150	93,904

*Included with British.

Seventy per cent of the 2,395 naturalization petitions denied were rejected for want of prosecution. Most of the remaining cases were denied for lack of knowledge and understanding of the fundamentals of the history, principles and form of government of the United States.

Of the 403 judgments of naturalization revoked, 392 were cases in which the foreign service of the department of state initiated action because naturalized citizens had become residents of other nations within five years of U.S. naturalization. In 19 cases action was initiated by the immigration and naturalization service because naturalization had been fraudulently or illegally procured.

In addition to those persons whose United States citizenship was revoked, there were 4,443 persons who expatriated themselves by affirmative action: 1,401 by voting in a foreign political election or plebiscite; 1,084 through naturalization in a foreign state; 836 by taking up residence in a foreign state; 565 by serving in the armed forces of a foreign state; 557 by departing from the United States to avoid military service and for other reasons.

New Legislation.—On Aug. 27, 1951, S. 2055, an omnibus bill, was introduced into the senate; this was a refinement of two bills introduced previously. These bills had as their purpose the recodification, and in many particulars the revision, of immigration and nationality laws.

Of the public laws enacted during 1951 relating to immigration and naturalization, the most important was the Internal Security act of 1950 (public law 831, 81st congress, effective Sept. 23, 1950).

The purpose of the statute was to protect the United States from subversive activities. The law required in part that Communist organizations be registered; it required of each resident alien an annually recurring report of his address; it amended the immigration and nationality laws by refining, clarifying and augmenting the classes of persons to be considered as risks

"WETBACKS" hopping a freight car after slipping across the U.S.-Mexican border. They were part of an army of Mexican labourers invading the U.S. in 1951 in search of temporary farm work (mainly in California) or more permanent employment in factories farther north

to internal security; it established that membership *per se* in Communist or other totalitarian groups should be cause for exclusion, deportation or denial of naturalization. It added ability to read and write English to ability to speak it as a prerequisite for naturalization.

The Internal Security act specified that all members of Communist or totalitarian groups be excluded, deported or denied naturalization in appropriate cases. Enforcement of these provisions meant that nominal members of such groups, who may have joined youth groups or labour unions to obtain work, or for other similar reasons, had to be denied entry. Public law 14 (82nd congress, 1st session), approved March 28, 1951, clarified the immigration status of such aliens by defining membership in the proscribed organizations as being voluntary membership only.

An act of June 28, 1951 (public law 60, 82nd congress, 1st session), amended the Displaced Persons act of 1948, as amended, by extending from June 30, 1951, to Dec. 31, 1951, the terminal date of visa issuance for the major categories of displaced persons.

Other public laws relating to immigration included an act of Aug. 19, 1950 (public law 717, 81st congress, 2nd session), to permit the admission of racially ineligible spouses and minor children of citizen members of the U.S. armed forces. The time limit of this act was extended by public law 6 (82nd congress, 1st session), approved March 19, 1951.

Another noteworthy legislative development was public law 843 (81st congress, enacted Sept. 27, 1950), which exempted the conduct of deportation proceedings from sections 5, 7 and 8 of the Administrative Procedures act. From Feb. 20, 1950, the date of the supreme court decision in the case of *Wong Yang Sung* v. *McGrath*, until Sept. 27, 1950, the immigration and naturalization service conducted hearings with the full formalities required by the Administrative Procedures act. The new regulations and policies, drafted on the basis of public law 843, aimed at a concise hearing to determine alienage, deportability and eligibility for discretionary relief. At the same time, all the rights of the alien to a fair hearing were safeguarded. (*See* also IMMIGRATION AND EMIGRATION; LAW.) (A. R. MY.)

United Kingdom.—The number of aliens registered in the United Kingdom on Oct. 1, 1951, was 420,595 (males 254,547; females 166,048). The principal nationalities represented and the numbers of each compared with similar figures at the same date in 1950 were: Austrian 9,737 (10,037); Belgian 5,295 (5,520); Chinese 9,966 (9,725); Czechoslovak 5,223 (6,017); Dutch 9,363 (9,117); French 15,316 (14,901); German 47,359 (47,762); Italian 25,664 (21,672); Latvian 13,427 (13,794); Lithuanian 6,303 (6,860); Norwegian 6,096 (5,966); Polish 138,439 (145,524); Russian, including White Russian, 35,743 (38,172); Swiss 12,255 (12,878); U.S. 20,894 (18,283); Yugoslav 9,151 (9,391). The figures included 10,000 aliens to whom no nationality could be attributed. The number of incoming travellers to the U.K. during the first nine months was more than 630,000. In July 1951, 128,015 foreigners landed at U.K. ports and 106,772 embarked. Figures for July 1950 were 114,738 and 97,062.

In March 1951 the United Kingdom concluded a visa abolition agreement with Cuba. As the result of earlier agreements the nationals of the following countries were not required to obtain visas for travel to the U.K.: Belgium, Denmark, France, Iceland, Italy, Liechtenstein, Luxembourg, Monaco, the Netherlands, Norway, San Marino, Sweden, Switzerland and the United States. The provisions of the Aliens order, 1951 (statutory instrument 966/1951), included the extension from two to three months of the initial period during which a foreigner arriving in the U.K. was not required to register with the police and the extension from two weeks to two months of the period during which a foreigner living in the U.K. might be absent from his registered address without reporting the fact.

In 1951 about 36,000 permits were issued for nonresident foreigners to go to the United Kingdom and work for periods of varying length. The majority of permits were for domestic employment in hospitals, institutions and private households. In addition, the number of German, Austrian and Italian women received under official schemes for employment in hospitals, institutions and the undermanned industries rose to 10,000, 2,300 and 2,000, respectively. Recruiting teams went to Italy to select men for work in coal mining and other undermanned industries, and by Oct. 1951, 1,100 men for the coal mines and 1,100 for other industries had arrived in the U.K.

There were also 77,000 foreigners, mostly of Polish or Baltic origin, who were temporarily accommodated in displaced persons camps on the continent immediately after the end of World War II and had subsequently, prior to 1951, been admitted for employment in the United Kingdom with a view to settlement. With them came nearly 4,000 dependents. From Jan. 1, 1951, onward, those with three years' residence were free to take any work they could obtain. In addition, about 15,000 former members of the German armed forces, 8,500 former Ukrainian prisoners of war and 1,000 Italian former prisoners of war, who volunteered to remain in the U.K. to work in agriculture instead of accepting repatriation at the end of 1948, would be free to take any work they could obtain from Jan. 1, 1952, onward.

Between Jan. 1 and Oct. 1, 1951, 3,576 new applications for naturalization were lodged compared with 5,702 for the same period in 1950. Certificates granted during the same period numbered 3,501.

FILMS OF 1951.—*Service and Citizenship* (Coronet Films).
(T. G. W.)

Alimentary System, Disorders of: *see* STOMACH AND INTESTINES, DISEASES OF.

Allergy. Among conditions believed in 1951 to be to some extent allergic disorders, according to Leo H. Criep, were rheumatic fever, periarteritis nodosa and certain types of nephritis (collagen disease).

Since many instances of allergic rhinitis and bronchial asthma become secondarily complicated by infection, benefit might be obtained in these cases by antibiotic treatment, taken either by aerosol (breathing in) or by injection.

Much research was being conducted in immunochemistry as applied to allergy. The antibody may be obtained in pure form. Since allergy is one phase of immunology, these studies helped to make clear the nature of the allergic reaction.

Allergic manifestations are the result of antigen-antibody reaction. Light was being shed on this problem by research which involved the labelling of antigen molecules with radioactive isotopes. The localization of the antigen in the body was then determined by means of the Geiger counter or radioautographs. Frank Dixon and collaborators reported on the study of the fate of antibodies labelled with radioactive isotopes and late in 1951 were studying the life of antibodies in various species.

A new book dealt with regional factors in allergy, including a study of climate, humidity, temperature, etc., in various parts of the country with respect to the manner in which they affect the incidence, severity and extent of allergic disease.

Further studies showed that ACTH and cortisone are of value only as temporary expedients in the relief of the very acute stage of asthma or certain types of allergic dermatosis. According to Sidney Friedlaender, oral cortisone treatment is equally as effective in the treatment of asthma, hay fever, urticaria and other allergic diseases as comparable doses of the drug given intramuscularly.

Antihistaminic agents continued to enjoy popularity. They offer symptomatic relief only. Reports appeared on the serious and occasionally fatal results obtained from the prolonged and indiscriminate use of these drugs, indicating the danger of self-medication with these agents. Other reports indicated their uselessness as specific agents in the treatment of the common cold. Thurman Dannenberg and Samuel Feinberg pointed out that clinical tolerance may develop after prolonged administration of antihistaminic drugs.

W. C. Spain pointed out the shifting pattern of the agents which produce allergic conditions. This came about by the substitution of nonallergic materials such as rubber and others for feathers, rabbit hair, goat hair, wool, cotton, silk in beddings, furniture and toys. Neither horse serum nor horse dander retained any importance as allergens, because of reduced contact. Cosmetic manufacturers were substituting innocuous ingredients in place of orris root. Attempts were made in many areas to reduce ragweed pollen by spraying with 2, 4-D. To counterbalance such reductions in allergens, it should be stated that many new drugs, synthetics, plastics, new chemicals and dyes had been added to the list of agents which could produce allergic skin disorders of all kinds.

*Jooste, G. P.	South Africa, Union of	*Gallman, Waldemar J.
*Lequerica y Erquiza, Don José Félix de	Spain	*Griffis, Stanton
*Boheman, Erik	Sweden	*Butterworth, W. Walton
*Bruggmann, Charles	Switzerland	Patterson, Richard C., Jr.
El-Khouri, Faiz	Syria	Cannon, Cavendish W.
*Waithayakon, H.R.H. Prince Wan	Thailand	*Stanton, Edwin F.
*Erkin, Feridun C.	Turkey	*McGhee, George C.
*Panyushkin, Alexander S.	U.S.S.R.	*Kirk, Adm. Alan G.
*Mora, José A.	Uruguay	*Roddan, Edward L.
*Martín Araujo, Antonio	Venezuela	*Warren, Fletcher
	Viêt-Nam	Heath, Donald R.
Abu-Taleb, Sayed Abdurrahman ibn Abdussamed	Yemen	Hare, Raymond A.[14]
*Popovic, Vladimir	Yugoslavia	*Allen, George V.

*Ambassador. Unstarred—Minister.

[1] U.S. high commissioner.

[2] Diplomatic relations severed, Feb. 24, 1950.

[3] Resident in Saigon.

[4] Chargé d'affaires *ad interim*; minister and consul general; resident at Taipei, Formosa; embassy at Nanking closed, March 5, 1950.

[5] Acting consul general.

[6] Chargé d'affaires.

[7] U.S. high commissioner and chief of mission.

[8] Minister plenipotentiary, chargé d'affaires *ad interim*.

[9] U.S. political adviser with personal rank of ambassador.

[10] Diplomatic agent with personal rank of minister; consul.

[11] Resident in London.

[12] Resident in New Delhi.

[13] Consul.

[14] Resident in Jidda.

American Citizens Abroad. United States citizens residing outside the U.S. on Jan. 1, 1951, had increased in number by about 6,000 since Jan. 1, 1950. This was small compared with the increase of more than 50,000 between Jan. 1, 1949, and Jan. 1, 1950. However, there was a great change in the distribution of U.S. citizens in various areas of the world. In the continent of Asia there was a decrease of more than 50%, or 37,000 people. This decrease was offset by moderate increases in other areas: 10% in Mexico and Central America; 25% in Australia and New Zealand; 10% in the West Indies and Bermuda; and approximately 29% increase in Europe.

Military permits for private U.S. citizens desiring to proceed to Germany were abolished Jan. 15, 1951, and those wishing to make visits for education, reunion with family or for business or similar reasons were able to obtain visas from German consular officials in the United States permitting a stay of six months or longer. They were not entitled to military care and privileges.

On April 30, 1951, the restriction on travel to Hungary, pre-

STREAM OF PASSENGERS at New York International airport where about 15,000 travellers weekly, including U.S. tourists and business personnel, arrived and departed for foreign countries in 1951

viously imposed, was lifted but was again imposed Dec. 28, 1951, because of the inability of the U.S. government to assure against molestation those of its citizens proceeding to Hungary.

Travel to Czechoslovakia was forbidden as of June 2, 1951, but the passports of those already resident there were not invalidated.

The military authorities, in Sept. 1951, enlarged the categories of persons permitted to travel to Japan to include the dependents of military and civilian personnel. Permits had to be obtained from the military authorities before travel was started.

U.S. specialists, technicians, educators, nurses and doctors proceeded from the United States to less fortunate areas of the world to act as advisers and helpers in raising living and working conditions pursuant to the Point Four program of the United States as well as under the similar United Nations program. In most cases, this work entailed a two- to three-year residence abroad.

A comparative summary of U.S. citizens residing abroad Jan. 1, 1950, and Jan. 1, 1951, is shown in the table.

Estimate of American Citizens Residing Abroad

	Jan. 1, 1950	Jan. 1, 1951
South America	38,522	34,774
Mexico and Central America	44,195	48,389
Europe	91,886	118,815
Asia	68,887	31,716
Africa	9,073	10,243
Australia and New Zealand	4,855	6,136
West Indies and Bermuda	20,398	22,104
Canada and Newfoundland	131,062	142,955
Philippines	24,044	23,987
Iceland	926	742
New Caledonia	41	89
Totals	433,889	439,950

American Library Association. Celebrating its 75th anniversary on Oct. 4, 1951, which was proclaimed National Library day by many governors and mayors, the American Library association (A.L.A.), the official organization of librarians in the United States and Canada, is the oldest professional association for librarians and those interested in the development of library service. In 1951 the A.L.A., which was affiliated with more than 70 other library associations throughout the world, had a membership of about 20,000 in the U.S. and possessions, Canada and more than 50 foreign countries. The association had an endowment capital of approximately $2,163,000 in 1951 and a total income of about $904,000.

Headquarters are located at 50 E. Huron St., Chicago 11, Ill., with David H. Clift, formerly associate librarian of the Yale University library, the new executive secretary. The Washington, D.C., office, located in the Hotel Congressional, maintains liaison with all federal agencies and represents libraries on many projects.

In addition to a historical celebration, held in Philadelphia, Pa., its founding city, on Oct. 4, the A.L.A. sponsored during 1951 nation-wide adult discussion groups under public library leadership on the American heritage and its application to present-day problems. This project was financed by a grant of $150,000 from the Fund for Adult Education, which was established by the Ford foundation. Six regional and local libraries, representing various types of communities, were chosen for the demonstration.

The A.L.A. also helped in the creation of three books on its anniversary theme, "The Heritage of the U.S.A. in Times of Crisis": Gerald Johnson's *This American People,* Henry Steele Commager's *Living Ideas in America* and Genevieve Foster's *Birthdays of Freedom.*

Conferences during 1951 were held in Chicago: the midwinter meeting, Jan. 30–Feb. 3, and the 70th annual and 75th anniversary conference, July 8–14. Future conference plans called for a midwinter meeting in Chicago, Jan. 29–Feb. 2, 1952, and annual conferences in New York city, June 29–July 5, 1952, and in Los Angeles, Calif., June 21–27, 1953.

Officers, elected by ballot, who assumed their duties at the annual conference were: president, Loleta D. Fyan, Michigan State library, Lansing; first vice-president and president-elect, Robert B. Downs, University of Illinois library, Urbana; second vice-president, Marian McFadden, Indianapolis Public library, Indianapolis, Ind.; and treasurer, R. Russell Munn, Akron Public library, Akron, O.

The annual A.L.A. citations for distinguished service as library trustees were awarded to Mayor Charles P. Farnsley, Louisville, Ky., and Milton G. Farris, Atlanta, Ga. The 30th Newbery medal was received by Elizabeth Yates for *Amos Fortune, Free Man,* judged to be the most distinguished children's book of 1950. Katherine Milhous received the 14th annual Caldecott medal for *The Egg Tree,* chosen as the best illustrated children's volume of the year.

Helen E. Haines, author, editor and reviewer, received the Joseph W. Lippincott award ($500) for outstanding professional achievement in the field of librarianship.

The Ada McCormick *Letter* librarian award ($100) was received by Alice M. Dugas, librarian of the Mexico City College library, Mexico, for an outstanding demonstration of the human qualities of librarianship. The Delta Sigma Theta bookmobile, operating as a service of the West Georgia Regional library in Carroll, Heard and Haralson counties, received the *Letter* library award for "demonstrating the importance of extending library service to all groups in the population, particularly those in rural areas."

The first recipient of the Margaret Mann award, established by the A.L.A. division of cataloguing and classification, was Lucile M. Morsch of the Library of Congress, for outstanding professional achievement in cataloguing and classification.

Janina Nowakowska and Richard Wiebe of the Northern Regional Research laboratory, Peoria, Ill., received the Oberly Memorial award given every two years to the compilers of the best bibliography in the field of agriculture or natural sciences.

Nine libraries were presented with the 1951 John Cotton Dana Publicity awards, sponsored by the *Wilson Library Bulletin* and the A.L.A. public relations committee, for effective public relations programs.

The association was concerned particularly with the extension of complete and adequate library service for all citizens; the role of the library in the national emergency; censorship and intellectual freedom as applied to libraries; and the continuance of the U.S. information libraries and exchange of persons and books programs. During the year the A.L.A. approved new standards for the accreditation of library schools and minimum salary standards for librarians; conducted, in co-operation with the U.S. army, the Japan Library school; and supported the library services bill (S. 1452), which was introduced in the U.S. senate on May 9, 1951, designed to promote the further development of public-library service in rural areas.

(*See* also LIBRARIES.) (D. H. C.)

American Literature. The 11,000 titles published in the United States in 1951 offered the reader infinite choice. Two general kinds of works were widely read. One group, of fact and opinion, confronted the complexities of the surrounding world. The other, notably in fiction, turned inward to the private emotions, especially those of children. There was a downpour of books about the far east, the near east, both sides of the "iron curtain," North America and South America, as well as about the problems and policies of the United States. In fiction, although some of the best books dealt with World War II, a number of skilful books were concerned with the simple complexities of the adolescent mind.

The phenomenal sale of paper-bound books amazed regular publishers. Harry Bennett's sensational story of his years as Henry Ford's right-hand man, *We Never Called Him Henry,* rejected by various trade publishers, became a maverick best seller in paper covers, and some established writers were considering this form of publication. Reprinted in this form, serious fiction sold almost as many thousands of copies as did detective stories.

Nonfiction came close to outselling fiction. Such trouble spots as the U.S.S.R., China, Japan, Israel, Argentina and the near east were much discussed. Many of the popular books seemed more speculative and wishful than informed and objective. Edward Crankshaw analyzed the strength and weakness in the U.S.S.R. today in *Cracks in the Kremlin Wall.* Robert J. Alexander's *The Peron Era* gave a history of the Argentine dictatorship. Justice William O. Douglas, after a trip through the middle east, questioned the wisdom of United States foreign policy there in *Strange Lands and Friendly People.* James A. Michener, in *Return to Paradise,* found less of romance and more of politics and economics to report than he had in *Tales of the South Pacific.* Paul Blanshard covered controversial territory in *Communism, Democracy, and Catholic Power.*

Two important books which discussed the role of the United States in world politics were George Kennan's *American Diplomacy, 1900–1950,* an authoritative statement of present policies in their historical context, and Hans J. Morgenthau's *In Defense of the National Interest,* which was critical of those policies.

There were surprisingly few books about the war in Korea and a distinct falling off in the number of books about World War II. Most of the leaders had already written their stories. The Forrestal *Diaries,* edited by Walter Millis and E. S. Duffield, covered the war years. Omar N. Bradley told of his role in *A Soldier's Story.* Samuel E. Morison added another volume to *The History of United States Naval Operations in World War II,* "The Aleutians, Gilberts and Marshalls," covering amphibious warfare from June 1942 to April 1944. Eliot Janeway's *The Struggle for Survival,* one of the "Chronicles of America Series," surveyed the country's economic mobilization for World War II. Sumner Welles wrote about Franklin D. Roosevelt's important diplomatic decisions in *Seven Decisions That Shaped History.*

The American Scene.—All aspects of the current U.S. scene were material for writers. The conflicting demands of free speech and loyalty concerned many. Alan Barth, in his balanced study *The Loyalty of Free Men,* examined the methods by which loyalty was being determined and found them not invariably proper. Nathaniel Weyl's *The Battle against Disloyalty* was less critical of the methods officially employed and of the whole concept of the administrative loyalty check. Six public figures, Henry Steele Commager, Robert K. Carr, Zechariah Chafee, Jr., Walter Gellhorn, Curtis Bok and James P. Baxter, discussed the problem in *Civil Liberties under Attack.*

More sensational in their appeal were the books about crime. In *Crime in America* Estes Kefauver drew up a report of the connections the senate special committee to investigate organized crime in interstate commerce found between local politicians and the crime syndicates. Howard Whitman, in *Terror in the Streets,* developed the theory that the current wave of hoodlum terrorism was based on a psychological love of violence. Jack Lait and Lee Mortimer appeared again on the best-seller lists with their latest low-down report, *Washington Confidential.* Karl Schriftgiesser's *The Lobbyists* was a study of pressure politics.

In *The Conduct of Life,* the final volume of his distinguished series, Lewis Mumford proposed individual regeneration as the basis of a social philosophy for survival in our time. James B. Conant wrote *Science and Common Sense* in an attempt to interpret the world of science to the layman, and Hans Reichenbach's *The Rise of Scientific Philosophy* studied the background and growth of the new scientific philosophy.

Amid the current perplexities, nature kept its perennial appeal. One of the most widely read and praised books of the year was Rachel L. Carson's *The Sea around Us,* a beautifully written discussion of the sea, its history and inhabitants. Edwin Way Teale, in his elegiac *North with the Spring,* described the varying aspects of spring as it travelled north from Florida to New England. Jay Williams' *Fall of the Sparrow* reported on the species of wildlife that have died out or are dying; and Brooks Atkinson, in *Once around the Sun,* wrote an affectionate account of the natural phenomena to be seen in the city of New York.

The past and the passing scene were appealing, too, in historical and biographical studies. Marshall B. Davidson's impressive two-volume *Life in America* was a profusely illustrated social history of the country. Meyer Berger's *The Story of the New York Times, 1851–1951* reflected the civilization of those 100 years. Malcolm Cowley's revised and expanded *Exile's Return* was a personal account of the trek of the "lost generation" from Greenwich Village to the Left Bank and back. Alfred Kazin, in *A Walker in the City,* described his immigrant childhood in Brooklyn's Brownsville, and Stark Young, in *The Pavilion,* wrote about his early years in the deep south and later years in New York. Angelo Pellegrini's *Immigrant's Return* contained his memories of childhood on the west coast, his reflections as a professor on education and his experiences in visiting his Italian homeland. Selden Rodman made a social and psychological study in his *Portrait of the Artist as an American: Ben Shahn.*

Dale Kramer's *Ross and The New Yorker,* which appeared only a few weeks before the death of Harold Ross, was a biography of a man and a magazine generally credited with a notable influence on the course of American humour, fiction and journalistic writing. Nelson Algren's *Chicago: City on the Make* bitterly portrayed in prose poetry the city he loves.

The Harper History of Painting: The Occidental Tradition, by David M. Robb, covered time from the Stone Age to the present, and John I. H. Baur assessed contemporary art in *Revolution and Tradition in Modern American Art.* Two histories of the drama were Alan S. Downer's *Fifty Years of American Drama, 1900–1950* and Glenn Hughes's *A History of the American Theatre, 1700–1950.* Abel Green and Joe Laurie. Jr., covered the past 50 years of the popular stage in *Show Biz: From Vaude to Video. The Magic Curtain* was an autobiography by Lawrence Langner, founder of the Theatre guild. Other biographies included Ethel Waters' vigorous *His Eye Is on the Sparrow,* Gene Fowler's *Schnozzola: The Story of Jimmy Durante,* Lionel Barrymore's *We Barrymores,* which was mostly about Lionel, and two books about Charlie Chaplin, *The Little Fellow* by Peter Cotes and Thelma Niklaus and *Charlie Chaplin* by Theodore Huff.

Historical Works.—Among historical figures, Jefferson received much attention during the year. The second volume, *Jefferson and the Rights of Man,* of Dumas Malone's excellent biography *Jefferson and His Time* appeared. Leonard D. White's *The Jeffersonians* was a study in administrative history. Under the editorship of Julian P. Boyd, Lyman H. Butterfield and Mina R. Bryan, two more volumes of the *Papers* of Thomas Jefferson were published, volume iii, 1779–80, and volume iv, 1780–81. There was also Nathan Schachner's *Thomas Jefferson.*

Other biographies included volume iii of Douglas Southall Freeman's monumental *George Washington: A Biography;* the third and final volume of Calhoun's life by Charles M. Wiltse, *John C. Calhoun;* Bradford Smith's *Bradford of Plymouth;* and Waldo Frank's *Birth of a World,* the life and times of Simon Bolivar. Elting E. Morison published the first four volumes of the *Letters* of Theodore Roosevelt.

Two anthologies presented writings of the wartime president: *Franklin D. Roosevelt's Own Story,* selections from private and public papers edited by Donald Day; and *The Roosevelt Treasury,* edited by James N. Rosenau. Richard H. Rovere and Arthur M. Schlesinger, Jr., wrote *The General and the President and the Future of American Foreign Policy,* a pro-administration analysis of the Truman-MacArthur controversy.

The second volume of *An American History,* by Merle Curti and others, traced the transition of the United States to an industrial nation and its emergence as a world power. John C. Miller's *Crisis in Freedom: The Alien and Sedition Acts* was a thorough study of an era resembling our own. Oscar Handlin, in *The Uprooted,* told the story of the great migrations that made the American people, and Morris U. Schappes edited a valuable collection, *Documentary History of the Jews in the United States, 1654–1875.* C. Vann Woodward wrote *Reunion and Reaction: The Compromise of 1877 and the End of Reconstruction.* There were two historical studies of American progressives. Russel B. Nye, in *Midwestern Progressive Politics,* found a tradition of radicalism from the Grangers, through William Jennings Bryan and Robert M. La Follette to the present. Daniel Aaron, in *Men of Good Hope,* sought to define "progressivism" by a study of representative American progressives.

Fiction.—The year was not a distinguished one in fiction. But there were a few excellent books and many interesting ones, most of them falling into one of two categories. Some were about World War II, perhaps more than in any year since the war ended. Others were studies of the dark disorganized areas of the adolescent mind or the parent-child relationship.

ROBOT from *The Day the Earth Stood Still,* a science fiction motion picture released in 1951. Science fiction had a fast-growing readership during the year

The most successful of the war novels was Herman Wouk's *The Caine Mutiny,* a fine sea story, though a less convincing account of a Princeton boy's maturing in the stress of Pacific naval war. Counterbalancing Wouk's psychopathic captain there was John P. Marquand's portrait in *Melville Goodwin, USA* of a very nice officer and his problems, treated as a comedy of manners. Robert Bowen's *The Weight of the Cross* concerned the spiritual regeneration of a man through years in a Japanese prison camp.

The most controversial novel of the year was James Jones's *From Here to Eternity,* a diffuse naturalistic exposure of the depravity at all levels of life in the regular army just before Pearl Harbor. The precision with which it reproduced the speech and habits of the enlisted man shocked some readers, and its remoteness from the general world alienated others; but there was a residue of scenes and a cumulative power which raised the book well above the commonplace.

Two books by previously successful authors dealt with people involved in the confusion and despair of the postwar world. Willard Motley, in *We Fished All Night,* brought an actor, a union organizer and a poet back to Chicago from the war and traced their attempts at adjustment. Norman Mailer's *Barbary Shore,* forsaking the solid realism of *The Naked and the Dead* and developing its latent strain of symbolism, attempted an ambitious allegorical treatment of political and moral issues, but the form soon dissolved in overt discussion. Neither book came up to the level of its author's earlier work.

Of the writers who turned to the adolescent mind, J. D. Salinger, in *The Catcher in the Rye,* caught most successfully the mood, agony and language of a 16-year-old boy getting tough with the world. Caroline Gordon's *The Strange Children,* an allegory of modern society, stood on its own right as a story of a sensitive ten-year-old girl in a world of sophisticates perched in a southern landscape. James Agee followed the highly emotional "conversion to life" of a 12-year-old boy, in *The Morning Watch.* Shirley Jackson's *Hangsaman* was an atmospheric story of a college girl's struggle against her father's determination to make a writer of her.

William Styron won considerable notice with his first novel, *Lie Down in Darkness.* It was the familiar story of the degeneration of a southern family, concentrating upon an intense father-daughter relationship. Wright Morris, in *Man and Boy,* presented a satirical character study of a mother as she christens a ship named for her dead son.

William Faulkner did not enhance his reputation with *Requiem for a Nun.* Written partly in play form, partly in rambling passages on the history of his usual country, it recapitulated and brought to a conclusion the story of *Sanctuary.* John Dos Passos, in *Chosen Country,* through the story of his characters' American antecedents, brings them to a peaceful contentment with the country of their parents' choice. Sinclair Lewis' posthumous novel, *World So Wide,* was far from his great works. In *The Farmer's Hotel,* one of his most successful novels, John O'Hara assembled some of the people he understands best, in his chosen Pennsylvania countryside, and revealed them dramatically through their talk and actions.

George R. Stewart's attempt in *Sheep Rock* to give personality to a landscape, though less effective than his studies of storm and fire, was nevertheless a vivid book. James Aldridge's *The Hunter* was an almost idyllic story of trappers in the north woods. Laura Z. Hobson, with her usual competence, satirized a man risen suddenly to literary fame in *The Celebrity.* Stephen Becker's first novel, *The Season of the Stranger,* told the story of an American professor in southern China. Jessamyn West achieved something more than a regional novel in *The Witch Diggers,* with its funny and violent poorhouse keepers and inmates. Don M. Mankiewicz showed the seamy side of race tracks in *See How They Run.* Paul Wellman wrote a cinematic historical novel, *Iron Mistress,* based on the life of James Bowie.

There were no unusual collections of short stories. Carson McCullers brought together three previously published novels, a novelette and six short stories in the volume *Ballad of the Sad Cafe.* Hortense Calisher, a new writer, published a collection of good stories, *In the Absence of Angels.* Other collections were Edward Newhouse's *Many Are Called,* Kay Boyle's *The Smoking Mountain* and Frank O'Connor's *Traveller's Samples.*

Scholarship.—The year 1951, the 100th anniversary of the publication of *Moby-Dick,* brought several important contributions to Melville scholarship. Jay Leyda's monumental documentary biography, *The Melville Log,* gave a record of Herman Melville's life with new materials gathered from all contemporary sources and chronologically presented to allow each reader to make his own interpretation. Closely related was Leon Howard's *Herman Melville,* a new and circumstantial interpretation with a detailed account of the composition of his works. William Gilman wrote an excellent study, *Melville's Early Life and Redburn,* and a scholarly centennial edition of *Moby-Dick* as a volume in the new *Complete Works* was in preparation. Another figure being currently rediscovered was studied in Arthur Mizener's *The Far Side of Paradise,* a critical biography of F. Scott Fitzgerald, whose own works were also reprinted and widely read.

There were three additions to the distinguished "American Men of Letters Series": F. W. Dupee's *Henry James,* F. O. Matthiessen's *Theodore Dreiser* and Irving Howe's *Sherwood Anderson.* James Schevill's *Sherwood Anderson: His Life and Work* gave another interpretation. Henry Seidel Canby added *Turn West, Turn East* to the list of his able studies of American writers. Rebecca Patterson's *The Riddle of Emily Dickinson* roused controversy but little credence by the claim that a woman was the object of the love poems. Mildred R. Bennett's *The World of Willa Cather* was a collection of interviews and reminiscences from her Nebraska home country. Harry Modean Campbell and Ruel E. Foster analyzed America's most eminent living novelist in *William Faulkner: A Critical Appraisal.* Two other biographical studies of contemporaries were Donald Sutherland's *Gertrude Stein* and William Manchester's *Disturber of the Peace: The Life of H. L. Mencken.*

Several valuable contributions were made to general literary history. A. H. Quinn edited a one-volume survey, *The Literature of the American People.* Studies of 20th-century literature were Frederick J. Hoffman's *The Modern Novel in America, 1900–1950* and John Aldridge's *After the Lost Generation.*

Among collections of essays the most notable were *The Kenyon Critics,* edited by John Crowe Ransom, and Edmund Wilson's *Classics and Commercials: Literary Chronicle of the Forties.* The essays in Irwin Edman's *Under Whatever Sky* were a philosopher's reflections on varied subjects. George Santayana, in *Dominations and Powers,* discoursed on liberty, society and government. Virgil Thomson collected his musical criticism in *Music, Right and Left.*

Poetry.—There were new names in poetry in 1951 and names which were rapidly becoming established. William Carlos Williams completed his long work with *Paterson,* book iv, and published *Autobiography,* his life as physician and poet. Robert Lowell, former Pulitzer prize winner, wrote *The Mills of the Kavanaughs.* The reflective lyrics of Theodore Roethke's *Praise to the End!* reached back into the experiences of the poet's childhood. *Celebration at Dark,* by William Jay Smith, and *Ceremony and Other Poems,* by Richard Wilbur, were collections of lyrics by young writers. W. H. Auden published *Nones,* 31 new poems dealing with the problems of our civilization. Randall Jarrell wrote *The Seven-League Crutches,* and Kenneth Rexroth's *Beyond the Mountains* was a group of four one-act verse plays on classic themes. Horace Gregory's *Selected Poems* covered the range of his work and consolidated his reputation. The work of Ezra Pound maintained its stature and interest as the controversy over his patriotism waned. Peter Russell edited *An Examination of Ezra Pound,* and Hugh Kenner wrote a critical study, *The Poetry of Ezra Pound.* Upon the whole, the year's poetry was more impressive than its fiction. Andorra.

A small autonomous principality between France and Spain, Andorra is bounded on the north by the departments of Ariège and Pyrénées Orientales, and on the south by the Spanish province of Lérida. Area: 191 sq.mi. Population (1951 est.): 5,400. Language: Catalan. Religion: Roman Catholic. Capital: Andorra-la-Vieja (pop., 1951 est., 980). Co-princes: the president of the French republic and the bishop of Urgel, Sp., respectively represented in 1951 by André Bertrand and Jaime Sansa Nequi, their *viguiers* or representatives. An elected general council of 24 members appoints one of its members as the *syndic général des vallées* (from 1946: Francisco Cayrat).

Angling.

The popularity of fresh-water fishing in the United States levelled off during the fiscal year ending in June 1951. The total sale of anglers' licences was 15,337,758, compared with 15,478,570 the year before. The gross revenue derived by the 48 states from licence sales reached a new peak, however, at $34,018,009. Michigan headed the list with 1,050,756 licences.

California again ranked second with 995,830, followed by Wisconsin with 970,792.

The 43rd annual national casting tournament was held at Washington, D.C., Aug. 15–19. Herb C. Neuman took the all-distance championship with a score of 2,903 ft. The five-eighth-ounce distance event was won by Phil L. Varney with an average of 376 ft. The three-eighth-ounce distance event was won by William Lovely with an average of $325\frac{1}{3}$ ft. The distance trout fly event was won by Myron C. Gregory, with an average of $165\frac{1}{3}$ ft.

Gregory also captured the salmon fly distance event with an average of $197\frac{2}{3}$ ft.

A seven-man squad of anglers from the British Commonwealth won its bid for international tuna fishing honours at Wedgeport, N.S., Sept. 12–14, winning the Alton B. Sharp trophy in competition with four other teams from ten countries by the margin of 186 points. Thirty-four anglers participated. The United States team was second, followed by Scandinavia, Chile and Cuba. Knud Kyvsgaard of Copenhagen, Den., fishing for the Scandinavian team, caught the biggest tuna of the tournament, 805 lb. Kyvsgaard was said to be the only man to have taken tuna of more than 800 lb. on both sides of the Atlantic.

The International Game Fish association's outstanding world record catch for the year was a $961\frac{1}{2}$-lb. bluefin tuna, the largest fish of any kind ever taken in U.S. waters. This was captured on Nebraska shoals off the Rhode Island coast by Harry Brain of Dunellen, N.J., on Sept. 20, 1951. Nine other records were broken, making 1951 the most productive year in several decades. A 50 lb. 6 oz. carp was caught on July 29, 1951, by Maurice Vincent of Mishawaka, Ind. A $10\frac{3}{4}$-lb. Sunapee trout was caught on July 1 by Charles A. Cleveland of Lake Sunapee, N.H. An eight-pound black bullhead was caught on Aug. 1 by Kani Evans of Lake Waccabuc, N.Y. A 20-lb. bluefish was caught on Aug. 5 by Philip Chasin of Montauk, N.Y. A 41-lb. permit was caught on April 18 by Ernest J. Arnold of Islamorada, Fla. A 483-lb. giant black sea bass was caught on May 22 by R. E. DeGroff of Coronado Island, Calif. An eight-pound sea bass was caught on May 13 by H. R. Rider of Nantucket sound, Mass.

A 15 lb. 14 oz. blackfish or tautog was caught on June 1 by Caleb Campbell of Seabright, N.J. A 275-lb. sailfish (Pacific) was caught on July 31 by Albert Steinbaum of La Paz, Mex.

(A. J. Me.)

Anglo-Egyptian Sudan.

A territory in northeast Africa, Anglo-Egyptian Sudan is under the joint sovereignty of Great Britain and Egypt. Area: 967,500 sq.mi. Pop. (no census ever taken, 1950 est.): 8,350,000. Languages: English, Arabic and various Nilotic and Negro tribal dialects in the south. Religion: Arabic minority is Moslem; the bulk of the Negro population is heathen; only *c.* 20% of population in the south is Christian. Chief towns (1948 est.): Khartoum (cap., 71,400); Omdurman (125,300); El Obeid (70,100); Wad Medani (57,300); Port Sudan (47,000). Governor general in 1951, Sir Robert George Howe.

History.—The events of 1951 were overshadowed by the mounting Anglo-Egyptian dispute, in which the future of the Sudan was one of the two major issues at stake. This dispute

ANGLERS wading in the Musconetcong river at Hackettstown, N.J., on the opening day of the 1951 trout season

naturally attracted a great part of Sudanese attention, and toward the end of the year it had considerable repercussions in the Sudan itself, but there was also a steady development along the path to self-government and independent statehood.

The Sudanization of government was carried forward. It was announced in January that a Sudanese had been appointed director of the El Obeid district. Echoes of the world-wide conflict were heard early in February when the police raided the homes of a number of adherents of the so-described "peace campaign" and seized a quantity of Communist literature. Subsequently 16 young Sudanese were put on trial for participating in this movement and were convicted. Meanwhile, in April more than 100,000 Sudanese workers began a three-day strike under the auspices of the Sudanese Trade Unions federation in an attempt to obtain substantial wage increases, shorter working hours and other advantages. The rejection of demands for higher wages led in May to a strike of public transport in Khartoum which seriously interrupted the life of the city for five days. More serious perhaps was the strike of policemen that took place in Khartoum in June, leading to the declaration of a state of emergency on June 13 and the eventual imprisonment of 11 strike leaders. Following all this, a four-day strike of government unions occurred in Khartoum.

Meanwhile the issue of the demand for early self-government received close attention. On Dec. 15, 1950, the legislative assembly had voted by 391 to 38 in favour of asking the United Kingdom and Egypt for Sudanese self-government in 1951. At the conclusion of its second session on April 4, 1951, the assembly heard a message from the governor general to the effect that this request was receiving the fullest consideration.

Later in the year the question of the future of the Sudan became magnified once more from one of overmastering domestic interest into the status of a major issue in international relations, when the intensification of the Anglo-Egyptian conflict concentrated attention on the renewed Egyptian demand for the "unity of the Nile valley."

This development produced substantial changes in the situation of Sudanese political parties as it had first emerged in 1948. The Ashigga group, led by Ismail el-Azhari, aspiring to the Nile valley unity, was seriously disrupted by the announcement of the deflection of the followers of Ali el Mirghani to the side of full self-government. Egyptian attempts to restore unity to the "internal struggle front" were unsuccessful.

The pro-Egyptian faction in the Sudan was thus seriously weakened by the events of the year. On the other hand it became clear that the independence front, led by Abdurrahman el-Mahdi, head of the Umma (Nation) party, and Miralai Abdullah Khalil, president of the legislative assembly, was in no sense a mere instrument of British interests as it made clear its desire for immediate self-government. Its principal objective continued to be resistance to Egyptian claims for the absorption of the Sudan, and its aspirations clearly coincided with the intention of the British government, which reiterated its refusal to consent to the renewed Egyptian demand for the acknowledgment of Egyptian sovereignty in the country. (*See* also EGYPT.)

(H. S. D.)

Education.—(1950) *Northern System:* Government schools: elementary 262, pupils 37,000; subgrade and Koran 540, pupils 40,000; intermediate 21, pupils 2,661; secondary 6, pupils 1,457; technical 3, pupils 264; teachers' training colleges 5, teachers trained annually more than 255. Nongovernment schools 172, pupils 15,900. University education at Gordon Memorial college and higher education at Kitchener School of Medicine. *Southern System:* Schools: elementary 3, pupils 327; secondary 1; intermediate 1, pupils 150; pupils at mission schools 23,384. Government training schools 2; primary teachers' training centres 2.

Finance and Banking.—Budget (18 months 1950–51, actual): revenue £E44,800,000, expenditure £E23,200,000; (1951–52 est.) revenue £E24,800,000, expenditure £E17,800,000. Total external debt (Dec. 31, 1949) £E12,300,000, of which £E5,300,000 was to Egypt for development. Monetary unit: Egyptian pound with an exchange rate of £E1=U.S. $2.87.

Foreign Trade.—(1950) Imports £E26,800,000, exports £E33,200,000. Main sources of imports: U.K. 40%, India 14%. Main destinations of exports: U.K. 54%, India 12%. Main imports: sugar, coffee and tea 18%; cotton piece goods 12%; coal, oil fuel and gasoline 5%. Main exports: raw cotton 69%; gum 8%; cottonseed 6%; livestock 5%.

Transport and Communications.—Railways (1950): 2,056 mi. Licensed motor vehicles (Dec. 1950): cars 3,500, commercial 4,500. Telephone subscribers (1949): 3,520. Radio receiving set licences (1949): 3,227.

Agriculture.—Main crops (metric tons, 1949): cotton, ginned, 66,000; cottonseed 110,000; sesame seed 72,300; gum arabic, exports, 33,900; peanuts 9,000; dates 25,000; maize 19,000; millet 100,000; sorghum 642,000. Livestock (Jan. 1949): cattle 3,500,000; sheep 5,500,000; camels 1,500,000; horses 20,000; pigs 4,000; goats 4,300,000; asses 500,000.

Antarctica.

The antarctic continent lies almost entirely within and is circumscribed by the Antarctic circle. With an area of nearly 6,000,000 sq.mi., equal to the United States and Europe combined, nine-tenths of it is covered by an ice sheet, thousands of feet thick in places. The 2,000,000-sq.mi. area thus far seen by man has an estimated elevation of about 5,000 ft., with the south pole at a height of slightly less than 10,000 ft. The 14,000-mi. coast is largely inaccessible to ship navigation because of sea ice barricading the coastal shores.

History.—Expeditions from Norway, Sweden, France, Chile, Great Britain, Argentina and Australia were active in the antarctic during the 1951 season. The Norwegian-Swedish-British base at Maudheim in the Norwegian-claimed sector south of Africa concluded its second year of activity. Additional supplies were brought into the wintering base by the supply ship "Norsel" so that scientists could commence their third year of study from Feb. 1951 to March 1952. All but two of the original personnel who had spent two years there were exchanged for new personnel. In the 1951 antarctic summer, a field party was sent to newly discovered mountains about 200 mi. S. of the base for geological investigations.

The French expedition was operating for the second season on the pie-shaped sector of the ice-blocked coast south of Australia. This part of the antarctic was first discovered by the French admiral Jules Dumont d'Urville in 1840 and had been claimed by the French republic since; but this was the first time the area had been penetrated. In Feb. 1951 the French vessel "Commandant Charcot" brought 15 new explorers to relieve the original members of the group. These men made trips into the unknown hinterland with tractors and dog teams and did research in geophysics, geology, meteorology and oceanography.

Five bases were being maintained by the British on the Palmer peninsula south of Cape Horn, South America. Their base on Stonington Island in Marguerite bay, in close proximity to the U.S. Finn Ronne Antarctic Research expedition's wintering base of 1946–48, was abandoned in 1950 because of difficult ice conditions on the western side of the peninsula. Their northernmost base on the continent at Hope bay was also abandoned at that time. Preparations were being made to reactivate this base in Feb. 1952 for the continuation of local survey and weather observations.

Two bases each were being occupied by Argentina and Chile on the Palmer peninsula in close proximity to two of the British bases. It was reported in Aug. 1951 that one of the Argentine bases was destroyed by fire with the loss of all installations and stores, but with no casualties. Both the Chileans and the Argentines sent nonmilitary expeditions to the antarctic in March and April 1951 to establish a third permanent base on Stonington Island in Marguerite bay. From reports it would seem they were occupying the base of the U.S. Ronne expedition, which left all the buildings intact. This action by the Argentines and the Chileans caused the British government to make official protests to Chile and Argentina, both of which also claimed approximately the same area, which in the past had already caused considerable international tension.

On Nov. 28, 1951, an Argentine military expedition left Argentina with two ships, three specially equipped multimotored planes and about 200 men, headed for the newly established base on Stonington Island to carry out operations in support of the expedition already based there.

The Australian government maintained permanent weather stations on Heard and Macquarie islands to the south of Australia. (F. Re.)

Anthropology.

The steady growth of anthropology noted for previous years continued in 1951. In the United States the American Anthropological association observed its 50th anniversary and the Viking fund its 10th. A volume summarizing the activities of the latter organization (now the Wenner-Gren Foundation for Anthropological Research, Inc.) was published under the title *The First Ten Years, 1941–1951.* This foundation continued its generous support of anthropology in 1951, subsidizing field research and publication, awarding fellowships at universities and providing numerous grants-in-aid to scholars and institutions in the United States, Canada, Mexico, South America, Europe, Africa and Asia.

Under the guidance of Alfred Metraux, anthropology assumed an increasingly important role in the United Nations Educational, Scientific and Cultural organization's program for technical assistance to underdeveloped areas. A plan for more effective anthropological participation in the U.S. state department's Point Four program was worked out by a committee of the American Anthropological association under the chairmanship of Gordon R. Willey. At the request of the state department the committee arranged for the preparation of a training manual of anthropological orientation for use of government personnel engaged in administering the Point Four program of economic assistance for underdeveloped areas. The manual was prepared by Conrad Arensberg as editor, assisted by David G. Mandelbaum, Lauriston Sharp, Fred Eggan, Lucian Hanks, Stephen Reed and John Useem.

A new centre for anthropological research in Africa was created with the establishment of the West African Institute of Social and Economic Research at the University college of Ibadan in Nigeria. The Samuel Rubin chair in anthropology was established at Brandeis university, Waltham, Mass., and was to begin a program of research to determine the impact of cultural factors on social organization in the United States. The University of British Columbia received a grant for the development of teaching in anthropology and of ethnological research in British Columbia, under which arrangement Diamond Jenness, as visiting professor, and Wayne Suttles joined the faculty. Cora DuBois was appointed director of a new research program established by the Institute of International Education, Washington, D.C., for the purpose of determining educational needs and resources of the world's underdeveloped areas.

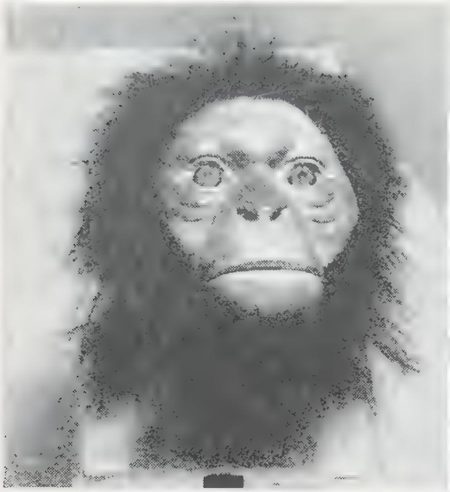
Harvard university, through its Russian Research centre, began a four-year study of the Russian people and the soviet social system. The project was under the direction of Clyde Kluckhohn and began with the interviewing of more than 3,000 persons who had left the U.S.S.R. for various reasons. With a grant from the Rockefeller foundation, Cornell university, Ithaca, N.Y., broadened its program of southeast Asia studies, directed by Lauriston Sharp. Northwestern university, Evanston, Ill., established an Institute on Contemporary Africa, under the direction of M. J. Herskovits, presenting a six weeks' integrated area program dealing with the political, economic, cultural and ethnic problems of Africa south of the Sahara. An over-all picture of area training facilities in the United States was given in a report on *Area Studies in American Universities,* by Wendell C. Bennett, published by the Social Science Research council.

The South Pacific was the scene of considerable anthropological activity during the year. The South Pacific commission made a survey of the status and needs of anthropology in the Pacific islands and authorized investigation of depopulation and overpopulation problems and of means for assisting island peoples to play a more important part in commerce and industry in the area. The Pacific Science board of the National Research council continued its coral atoll research program, sending a six-man team, including Ward Goodenough, anthropologist, to make a general ecological study of the interrelationships of all forms of life, including that of the native population, on Onotoa, a heavily populated dry atoll in the southern Gilberts. Anthropological and ecological studies were carried out under the same auspices at Arna, in the Marshall Islands, by Harry Uyehara of the University of Hawaii, and by Mary Murai, who made a nutritional survey of the island of Udot in the Truk archipelago. The Peabody museum of Salem, Mass., sent a two-year expedition to Polynesia, under the direction of Donald S. Marshall, to conduct ethnological work in the Cook and Society Islands, the Marquesas and Niue. Homer G. Barnett, of the University of Oregon, Eugene, made ethnological studies in Micronesia as staff anthropologist for the U.S. department of the interior in the Trust Territory of the Pacific Islands.

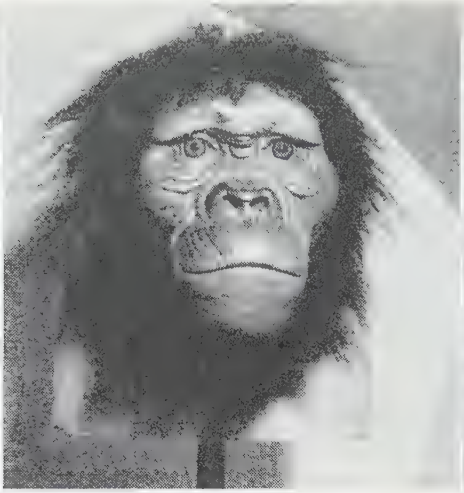
Under the sponsorship of the University of Michigan Center for Japanese Studies, Micha Titiev conducted research at Okayama on the general problem of the effect of western civilization on Japan's folk culture. Douglas Haring, Clarence Glacken and William W. Burd began anthropological work on Okinawa, Amami and Miyako, as part of the Pacific Science board's comprehensive program of scientific research in the Ryukyu Islands. Other anthropologists working in Japan were Earl Reynolds, who studied growth problems at Hiroshima, and Allan H. Smith and Ann G. Smith, who made ethnographic studies on Yaeyama in the Ryukyu Islands.

Adolf Jensen, director of the Froebenius institute, Frankfurt-on-Main, conducted ethnological and archaeological work in southwestern Ethiopia. Other anthropologists pursuing field work in Africa were William R. Bascom, who conducted research among the Yoruba of Nigeria; Martin Gusinde, who worked among the Bushman-Hottentot in South Africa; and G. L. R. von Koenigswald, who studied the ape-man fossils in Transvaal. Catherine McClellan spent a year in northwestern British Columbia working among the interior Athabaskan tribes, and Fred Hulse directed a program of blood typing of northwestern Indians.

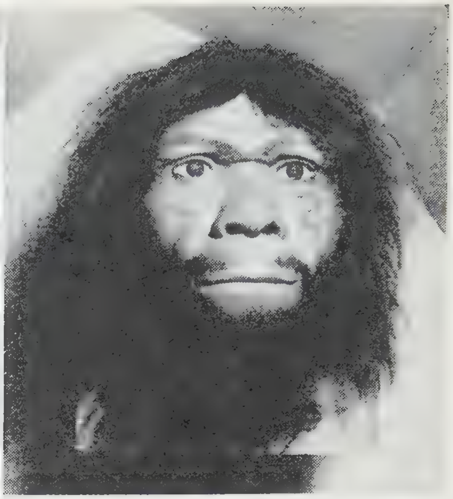
A series of articles by anthropologists, geneticists and palaeontologists summarizing the present status of knowledge of human genetics, primate evolution, classification of fossil men and the concept of race was published in *Origin and Evolution of Man,* a volume resulting from the 1950 Cold Springs Harbor (N.Y.) symposia on quantitative biology. Another important contribution in this field was a volume of papers on the *Physical Anthropology of the American Indian,* presented at the fourth Viking fund seminar and edited by William S. Laughlin. Included was a paper by Laughlin ("The Alaska Gateway Viewed from the Aleutian Islands") which showed that from the evidence of blood groups and somatology the Aleuts were morphological variants of



THE MIOCENE APE, Proconsul, with some human characters

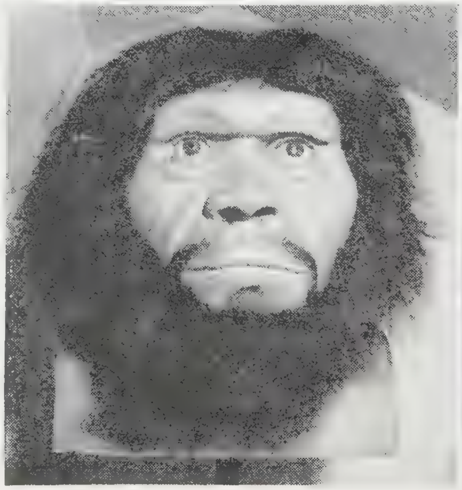


THE RHODESIAN PRIMATE, *Australopithecus*, with some human characters

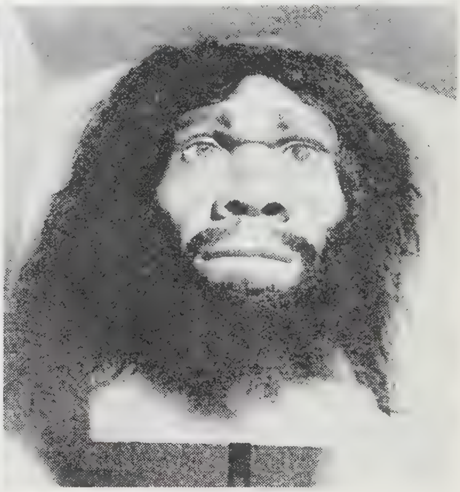


PEKING MAN, *Sinanthropus*, an ape man with a slightly larger brain than the Java man

Human evolution illustrated by models reconstructed from fossil remains for the Dome of Discovery at the 1951 Festival of Britain. The seven types shown here attempt to trace the incomplete record of the ascent of man and have acted as signposts in applying the theory of evolution to man. The reconstruction models were by Maurice Wilson

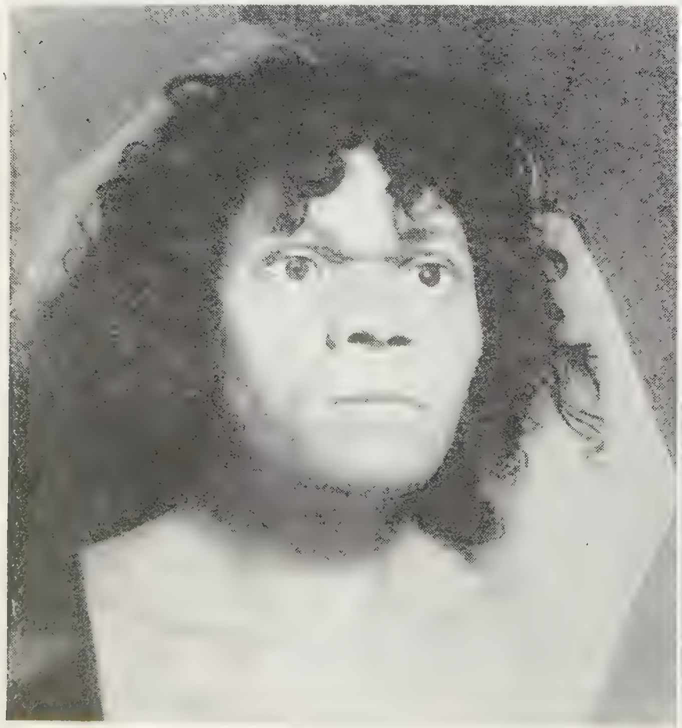


JAVA MAN, *Pithecanthropus*, once believed to be the "missing link" between apes and man

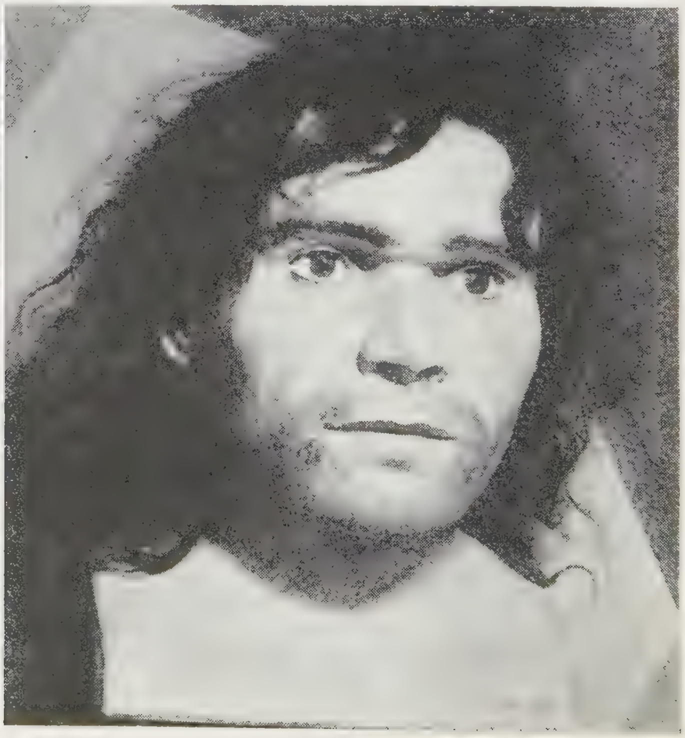


PILTDOWN MAN, *Eoanthropus*, a primitive type of man

NEANDERTHAL MAN, the most familiar antecedent of modern man



AURIGNACIAN MAN, the Cromagnon type and the first of the *Homo sapiens* group



the Eskimo stock, rather than Asiatic or Indian. Joseph B. Birdsell's article "The Problem of the Early Peopling of the Americas as Viewed from Asia," published in the same volume, marked a fresh and original approach to this much-discussed question. Accepting Carleton S. Coon's hypothesis that the Mongoloid race had developed under stress of an arctic environment in northeastern Siberia late in the fourth glacial period, he suggested that the American aborigines were a mixture of Mongoloid and an earlier Caucasoid stock which he named "Amurian," represented today by the Ainus and south Australians. Birdsell contended that the conventional method of racial comparison by means of cranial measurements and indexes leads to impossible results and is biologically invalid. H. B. Collins, in an article "The Origin and Antiquity of the Eskimo" published in the 1950 Smithsonian *Annual Report* (1951), reached the same conclusion; namely, that previous attempts to derive the Eskimo from some American Indian stock, solely on the basis of cranial measurements and indexes, had led to results that were demonstrably invalid in the light of the total evidence of physical anthropology, archaeology and linguistics.

In London, a special meeting of the Royal Anthropological institute was held on the subject of blood groups and anthropology, under chairmanship of H. J. Fleure, to promote closer collaboration between anthropologists, serologists and geneticists, and to make plans for a future blood group research centre. A committee of European and American anthropologists and geneticists met in Paris under the auspices of U.N.E.S.C.O. to formulate a statement on race that would be less subject to misunderstanding and criticism than U.N.E.S.C.O.'s original statement issued in 1950.

Adolph H. Schultz resigned from the Johns Hopkins university, Baltimore, Md., to become professor of anthropology and director of the Anthropological institute, University of Zürich, Switz. Gordon T. Bowles went to Tokyo as visiting professor of anthropology.

Viking fund medallists for 1951 were Clyde Kluckhohn for ethnology; W. M. Krogman, physical anthropology; and Emil W. Haury, archaeology.

The *Ethnographic Survey of Africa*, edited by Daryll Forde, continued its series of concise ethnographic accounts of African peoples with *The Southern Lunda and Related Peoples*, by Merran McCulloch; *Bamba and Related Peoples of Northern Rhodesia*, by Wilfred Whiteley; *Akan and Ga-Adangbe Peoples of the Gold Coast*, by Madeline Manoukian; and *Peoples of the Lower Luapula Valley*, by J. Slaski. Other important publications of the year were *Fossil Mammals of Africa: The Miocene Hominoidea of East Africa*, by W. E. Le Gros Clark and L. S. B. Leakey; *Social Anthropology*, by E. Evans Pritchard; *Social Evolution*, by V. Gordon Childe; *The Foundations of Social Anthropology*, by S. F. Nadle; *The Koreans and Their Culture*, by Cornelius Osgood; *The Pacific Islands*, by Douglas Oliver; *The Northern and Central Nootkan Tribes*, by Philip Drucker; *Sexual Behavior in Western Arnhem Land*, by Ronald M. and Catherine H. Berndt; *Languages of the U.S.S.R.*, by W. K. Matthews; *Patterns of Sexual Behavior*, by C. S. Ford and Frank A. Beach; *An Introduction to Social Anthropology*, by Ralph Piddington; *African Systems of Kinship and Marriage*, by A. R. Radcliffe-Brown and Daryll Forde. (*See* also ARCHAEOLOGY.)

Aqueducts. The integrated operation of multiple water-use features in the world's largest system of aqueducts and canals, dams and storage reservoirs was increased by the United States bureau of reclamation in 1951 on the eve of its golden jubilee year of water resource conservation in the 17 western states. The bureau and its predecessor, the federal reclamation service, established in the department of the interior under the Reclamation act of 1902, have been primarily responsible for the reclamation of western arid and semiarid lands during the past half century.

The man-made waterways included in 1951 more than 16,000 mi. of canals and laterals, 107 storage and 68 diversion dams, 440 pumping plants and the largest and highest concrete dams on earth. Hoover dam, 726 ft. high, on the Colorado river at the Arizona-Nevada border, was the loftiest; Shasta dam, 602 ft., on the Sacramento river in California, ranked second; and Hungry Horse dam, 564 ft., nearing completion on the South fork of the Flathead river in Montana, third. Grand Coulee dam on the Columbia river in Washington was the world's largest concrete dam in volume, containing 10,585,000 cu.yd. of concrete; Shasta was second, with 6,541,000 cu.yd.; and Hoover third, with 4,400,000 cu.yd.

These facilities made water available to a total of 6,025,000 irrigable acres in the 1950 crop year. The volume of crops produced was more than 16,000,000 tons, valued at $578,238,000.

Hydroelectric power generating plants on bureau projects in 1951 had a total installed capacity of 3,939,000 kw. and furnished more than 21,000,000,000 kw.hr. of energy for western farms, homes and industry. The federal government received more than $35,000,000 from the sale of the hydroelectric power.

Spectacular achievements under the program in 1951 were:

The greatest water lift in history was begun at Grand Coulee dam, where 2 of an eventual series of 12 of the world's largest pumps help raise Columbia river water a total of 630 ft. above the natural stream bed to flow into a 27-mi. reservoir. The water would irrigate an ultimate total of 1,029,000 ac. of dry land. Aqueducts under construction on the project were the 88-mi. West canal and the 130-mi. East Low canal.

Integrated operation of man's longest and largest mass transfer of water was initiated in the Central valley of California. Under this program, Sacramento river water stored behind Shasta dam was delivered 500 mi. to dry lands in the San Joaquin river valley. At Tracy, Calif., giant pumps lifted the water 200 ft. The project included the 153-mi. Friant-Kern canal and the 120-mi. Delta-Mendota canal. The former delivered San Joaquin river water from Millerton lake behind Friant dam to areas as far south as Bakersfield, Calif. The latter transferred Sacramento river water from the San Francisco bay area southward 120 mi., discharging it into the Mendota pool in the San Joaquin basin, thereby providing irrigation water to replace that diverted by the Friant-Kern canal.

Three pumps with a combined capacity of nearly 500,000 gal. of water per minute were set in motion at the Granby, Colo., pumping plant, high on the west slope of the Rockies, to supply irrigation water through the Colorado-Big Thompson project for 700,000 ac. of land on the east slope. This project was famous for its 13-mi. Alva B. Adams tunnel, the longest irrigation tunnel in the world, carrying the water through the continental divide.

Also included among the major aqueduct systems was the All-American canal in California, the largest irrigation canal in operation in the United States. This waterway was 232 ft. wide at the water surface, 160 ft. wide at the bottom and 20.6 ft. in depth, with an initial capacity of 15,155 cu.ft. of water per second. The project included the 125-mi. Coachella canal which branched from the 80-mi. All-American main canal near the Mexican border about 20 mi. W. of Yuma, Ariz., and terminated near Indio, Calif. (*See* also Canals and Inland Waterways; Dams; Irrigation; Tunnels.)

Films of 1951.—*The Importance of Water* (Bailey Films).

(M. W. Ss.)

Arabia.

A peninsula of southwestern Asia (area *c.* 1,021,300 sq.mi., total pop. est. 11,467,000), Arabia consists politically of two independent Arab states, Saudi Arabia and Yemen (*q.v.*); the independent sultanates of Oman and Masqat or Muscat; the autonomous sheikhdoms of Bahrein, Kuwait, Qatar and the Trucial sheikhdoms; and Aden colony and protectorates (*q.v.*). Language: Arabic. Religion: Moslem (Sunni).

Saudi Arabia.—Area: *c.* 597,000 sq.mi. (excluding the Rub' al-Khali desert covering approximately 193,000 sq.mi.). Pop. (1950 est.): 6,000,000. Chief towns: Riyadh (cap., 60,000); Mecca (150,000); Medina (45,000); Jedda (40,000); Hufuf (31,500). Ruler, King 'Abd-al-'Aziz ibn 'Abd-al-Rahman ibn Faisal ibn Sa'ud; viceroy of Nejd and commander in chief, Amir Sa'ud, crown prince; viceroy of Hejaz and minister of foreign affairs, Amir Faisal, the king's second son.

History.—Throughout 1951, the Saudi Arabian government participated in the deliberations of the Arab league and in January signed the Arab league security pact. In October its delegate attended a meeting in Cairo called by the Egyptian minister of foreign affairs to discuss the Arab implications of Egypt's denunciation of the Anglo-Egyptian treaty of 1936 and of the Sudan condominium convention of 1899. In April the Saudi Arabian government publicly expressed its sympathy with Syria during the Israeli-Syrian outbreak on the Jordan.

In June the appointment was announced of Arthur N. Young, a U.S. financial expert, to the post of financial adviser to the Saudi Arabian government, and on June 18 an agreement was signed between the government and the United States dealing with the use and development of the Dhahran airfield serving the oil fields of the Arab-American Oil company (Aramco) in the gulf province of El Hasa. By it the Saudi Arabian government assured to the U.S. government the continued use of the Dhahran airfield in return for which the United States would assist Saudi Arabia with the supply of military equipment and in the training of Saudi Arabians in its use. The agreement stipulated that the Dhahran airfield would not be converted into a U.S. base. It was accepted, however, that facilities could be prepared for its use in wartime.

In August Amir Faisal visited London where he had discussions with the British government regarding the fixing of the boundary between Saudi Arabia and the British-protected sheikhdoms along the Trucial coast at the southwestern end of the Persian gulf. The ownership of certain islands and sea-bed shores along the Persian gulf was also discussed.

On Oct. 24 the four powers—Great Britain, France, Turkey and the United States—communicated to the Saudi Arabian government their plans for the organization of an international command for the defense of the middle east. On the rejection of these proposals by Egypt, the four powers informed the Saudi Arabian government that their defense plans in the middle east would nevertheless proceed.

On Nov. 10 King Talal of the Hashemite Kingdom of Jordan arrived in Jedda on an official visit to King Ibn Sa'ud.

(O. M. T.)

Education.—Schools (1950): primary 30, secondary 5, pre-university 1.

Finance.—Pilgrimage dues (1948 est. £10,000,000) and oil royalties (1948 est. more than £20,000,000) are the main sources of revenue. Monetary unit: rial; there is no fixed exchange rate but in Nov. 1950 it was 8.14 rials to the pound, or 2.90 rials to the U.S. $1.

Transport and Communications.—Roads (1948) metalled, 45 mi. Licensed motor vehicles (Dec. 1950): cars 6,000; commercial 7,700. Telephones (1946), 2,500. Radio receiving sets (1949), 9,000.

Industry.—Crude oil production (1950) 26,904,000 metric tons. Raw materials: copper (1948) 67 metric tons; gold (1950) 66,202 troy ounces; silver (1950) 124,287 troy ounces.

Oman and Masqat.—Area: *c.* 65,000 sq.mi. Pop. (1950 est.): 550,000. Cap., Masqat. Ruler (from 1932), Sultan Said bin Taimur.

Bahrein.—Area: 213 sq.mi. Pop. (1950 est.): 110,000. Ruler (from 1942): Sheikh Sir Sulman ibn Hamad al Khalifah.

Kuwait.—Area: *c.* 9,000 sq.mi. Pop. (1950 est.): 170,000. Ruler (from 1950): Sheikh Abdullah bin Salim al-Subah. Crude oil production (1950) 17,018,600 metric tons.

Qatar.—Area: *c.* 4,000 sq.mi. Pop. (1950 est.): 20,000. Ruler (from 1949): Sheikh Abdullah ibn Jasim al Thani.

Trucial Sheikhdoms.—Area: *c.* 16,000 sq.mi. (including the sheikhdoms of Shargah, Ras al Khaimah, Umm al Qawain, Ajman, Dubai, Abu Dhabi and Kalba). Pop. (1950 est.): 80,000.

Arab League: *see* Arabia; Egypt; Iraq; Jordan; Lebanon; Middle East; Syria.

Archaeology.

Eastern Hemisphere.—Available information on the archaeological discoveries of 1951 in the old world centred on western Europe, the circum-Mediterranean basin and the middle east. Archaeological news from countries behind the "iron curtain" was extremely tardy and brief; a new Czechoslovakian journal *Archeologické Rozhledy* became available which gave, in brief French summaries, news of Czechoslovakian excavations covering the range of materials from Aurignacian to mediaeval times. Archaeologists were still cleaning up after World War II. From Germany came descriptions of a fine group of Roman mosaics which appeared when the badly bombed basilica of Trier was being cleared for restoration, and of ancient and once-restored vessels again being reconstructed from the debris in bombed-out museum basements. The year saw a marked upswing in archaeological activity in Afghanistan, where both French and U.S. field parties were at work. One of the most important events of the archaeological year was the bracketing of sites through the "gap in knowledge" of the transition from the cave-dwelling stage to that of the established peasant-village economy, done by an Oriental institute-American Schools of Oriental Research expedition in Iraqi Kurdistan.

Pleistocene Prehistory.—The outstanding event of the year in the Pleistocene range was the development, by Dorothy Garrod of Cambridge university and her collaborator Suzanne de Saint-Mathurin, of the Magdalenian rock-shelter site "le roc-aux-sorciers" at Angles-sur-l'Anglin, Fr., to the point where a complete frieze of relief sculpture was appearing. There were indications that the frieze—much of which was still covered with fallen stone—would have an all-over length of 40 m.; clearance was being made from both ends toward the centre, where the greatest overburden of fallen rock lay, and the relief carvings of horses and ibexes were the finest examples of this type of art yet known. A remarkable life-sized head of a Magdalenian hunter, found several years earlier in the site, presaged additional human beings as part of the frieze when it was fully cleared.

In North Africa the American School of Prehistoric Research worked at the site of Oued Akarit. There Bruce Howe investigated a fossil spring deposit underlying several metres of sand, in which Levalloiso-Mousterian implements and the bones of fossil animals were found. A geological-archaeological survey of the classic Capsian area of Tunis was also carried on.

The excavations of Carleton Coon at Hotu cave in Iran, and of the Oriental institute-American Schools of Oriental Research expedition in Iraq, extended back into full Pleistocene times.

The Near-Middle East.—The University museum-University of Pennsylvania excavations at Hotu cave above the Caspian shore in Iran encountered three human skeletons at a depth of about 40 ft. and underlying a sand and gravel bed. This bed was first claimed to have been the result of deposition which took place during the last phase of glaciation (Würm), but latest reports were that a restudy of the evidence suggested a later Mesolithic date for the skeletons (unfortunately, the word "Mesolithic" had little chronological significance in this region). The upper levels of Hotu cave yielded an important sequence of materials from a date of approximately 6000 B.C. upward to recent times. Taken with the evidence from near-by Belt cave, excavated several years before by the same expedition, it now seemed clear that there was an early phase of incipient agricultural experimentation by cave dwellers living in the Caspian coastal strip.

Closer to the centre of the ancient near east, the Oriental institute-American Schools of Oriental Research expedition under Robert J. Braidwood (in collaboration with Bruce Howe of the Peabody museum, Harvard university, and H. E. Wright, Jr., of the department of geology of the University of Minnesota, Minneapolis) excavated four sites east of Kirkuk, Iraq. On behalf of the Iraq Directorate of Antiquities, the expedition tested the site of Barda Balka, where Acheulean-type hand axes, flake tools and pebble tools were found in gravels assigned to the beginning of the Würm glaciation. In the Palegawra cave, flint blades and microliths of the terminal cave-dwelling stage were reclaimed. At Karim Shahir, the expedition cleared traces of a temporary open-air settlement, with ground stone tools as well as chipped flint, which seemed to show the very beginnings of village life. At Jarmo, a site covering about three acres and with a depth of approximately 25 ft. made up of a dozen architectural levels, the expedition gathered evidence of the earliest-known fully established village stage. Jarmo dates to approximately 5000 B.C.; only the upper third of its deposit includes portable pottery. While not all phases of the "gap in knowledge" between the end of the cave stage and the established village stage were closed, the expedition's evidence bracketed this range of time, and, of more importance, did so in a "nuclear area" wherein the germs of development of the subsequent Mesopotamian civilization were appearing.

Diggers were also active in the later ranges of Iraq's history. The joint Oriental institute-University museum (University of Pennsylvania) expedition to Nippur resumed work in the late fall of 1951, concentrating on the "scribal quarter" of the town, where a fragmentary statue of the Gudea type, a Kassite plaque and a number of cuneiform tablets had been found. The British School of Archaeology in Iraq resumed its work at the ancient Assyrian capital of Nimrud, with spectacular results in reliefs, ivory carvings and architectural clearances. The Iraq Directorate of Antiquities began large-scale operations at the Parthian desert fortress of Hatra, under the direction of Sayid Fuad Safar; a private temple of considerable size yielded an important series of sculpture and reliefs, Graeco-oriental in style and with Aramaic inscriptions.

A new journal, *Les Annales archéologiques de Syrie,* appeared in Syria, published by the Direction Générale des Antiquités de Syrie, which gave summary accounts of the Direction's recent work in the Roman city of Bosra, in the Islamic city of Rakka and in the late (Roman, etc.) cemetery at Tell Nebi Mendi (Kadesh), and of the Dutch trial excavations under C. Hillen and P. V. D. Meer at Atcherine near Aleppo. In Lebanon, Dunand continued his important clearance of the earliest levels of Byblos. In Israel, work continued at Khirbet Kerak and on smaller sites. In Jordan the American Schools of Oriental Research completed its clearances at Roman Jericho and began work at Dhiban (the biblical Dibon). The important work of the Dominicans at Tell el Farrah was being continued, with concentration on the late (1st millenium B.C.) levels of the town. There did not seem to be evidence to substantiate newspaper claims that the city of the queen of Sheba herself had been recovered in southern Arabia.

The political situation in Egypt did not encourage foreign excavations, but the Oriental institute and the French school were carrying on their programs at Luxor and near Cairo.

In Iran, the French expedition under Roman Ghirshman at Susa was again at work, mainly in the Islamic levels. A University of Michigan (Ann Arbor, Mich.) survey party, which worked in Iran and Iraq, located rock-cut inscriptions in the Kurdish frontier region of these countries. In Afghanistan, Daniel Schlumberger carried on his important clearances at Balkh and Laskari Bazar, of Hellenistic and Ghaznavid dates respectively. The Délégation Française also began work at Mundigak, near Kandahar, where J.-M. Casel found a sequence of painted pottery and remarkably well-preserved architecture. Also in the Kandahar district, two parties from the American Museum of Natural History, New York city, were active, one under Louis Dupree, the other under W. A. Fairservis. Dupree tested two caves and a mound; the mound and one of the caves contained pre-Islamic painted pottery. Fairservis carried on surface survey, which extended south of the Helmund river into Seistan; he also surveyed and test excavated in Baluchi Pakistan, and established the relative stratigraphical position of the painted "Quetta" ware. When all of this new Afghan-Baluchi evidence was processed and interpreted, it was expected to throw considerable new light on the protohistory of this remote area.

In Turkey, an exploratory excavation of great promise was made in Sultan Tepe (Harran) by the Turkish Antiquities department and the British Institute of Archaeology. Harran is known to have been occupied through a very long range of historic time, and to have been the site of a temple to the moon god Sin. Seton Lloyd described the appearance, in a test sounding on the site, of a great cache of cuneiform tablets of an Assyrian library. One hundred and fifty intact tablets were extracted from this hoard for study; the rest were sealed back in place to await a full-scale clearance in 1952.

Classical Lands.—The University museum of Philadelphia resumed its work on the classical and preclassical site of Yassihuyuk-Gordion. Six main habitation levels were noted in a depth of 16 m.; the two uppermost were of Hellenic and Hellenistic date. In Greece itself, the French school worked at Delphi and Delos (mainly restoration and checking for publication), as well as in the agora of Thasos and in the Cyclades and on Crete. The French also undertook the direction of specialists in deep-water exploration, with equipment permitting examination to an average depth of 130 ft. Several ancient sunken ships were located. The British school resumed work at Mycenae, with Greek co-operation; portions of the "Tsountas" house were recleared and mapped, as were adjacent areas, and an undisturbed burned house was encountered. The American School of Classical Studies, having completed its concentration on the portions of the Athenian agora surrounding the stoa of Attalus (which was to be restored as a museum), was able to dig on a larger scale away from the stoa. A number of interesting objects were found and new topographical information was collected. There was considerable activity in Italy; Italian archaeologists were active and Einar Gjerstad of the Swedish school carried on his series of investigations on the early history of Rome. Reports became available on F. E. Brown's work for the American academy at Cosa, where the *arx* or sacred citadel and its buildings had been excavated, and evidence for the religious history of a Roman colony on Etruscan ground was reclaimed.

Western Europe.—Several important classical finds were made

U. OF L.

in cisalpine Europe. Gerhard Bersu reported on a very remarkable find of Roman parade armour in Straubing, Bavaria, which included seven fine visor masks and five chamfrons (face armour for horses). The find dated to the 2nd or 3rd century A.D., and seemed to have been cached at the time when the Germanic tribes overran this part of the Roman frontier in the middle 3rd century. In England, at Carrawborough on Hadrian's Wall, a Roman shrine to the Persian god Mithras was cleared. This mystery religion, which became popular with the Roman army in the east in the 1st century B.C., had spread to the western boundaries of the empire by the 3rd century A.D. The mosaics recovered at Trier in western Germany (mentioned above) were of mixed pagan and Christian origin of the 4th century A.D. Work on the repairing and clearing of the mosaics of Santa Sophia in Istanbul was advanced by the Byzantine Institute of America, and Robert Van Nice carried on his structural survey of the great building.

A remarkably well-preserved body of a man, perhaps dating to about A.D. 100, was accidentally recovered from a Danish peat bog at Tollund; the body was practically naked and the individual had met death by hanging. There is a general belief that such naked hangings were ritual sacrifices in connection with the great spring fertility festivals. The man had been well fed before death; Hans Helbaek of the Danish National museum was able to analyze the stomach contents and found the remains of a barley and linseed porridge. Further excavations were carried on at Jarlshof, on the south end of Shetland Island, on a Viking settlement which flourished for several centuries after A.D. 850. There J. R. C. Hamilton recovered adequate material for reconstruction of the fishing, farming and pastoral type of existence of the Vikings at home.

Africa.—Of the few reports available from Africa, the most remarkable was of a fine group of cast bronzes from the Soa cemetery at Midigué on Lake Chad. Hundreds of bracelets and figurines and many objects of enigmatic type were found in urn burials dating from the 10th to 16th century A.D. A series of caves was excavated by the South African Archaeological society near Johannesburg; these yielded materials covering the range from late premetal to iron-using times.

At the close of the year, no information was available for the year's work in archaeology in further Asia. (*See* also ANTHROPOLOGY.)

Sources used in the preparation of this article, other than those specifically mentioned: *Antiquaries Journal, L'Anthropologie, Antiquity, Archaeology, American Journal of Archaeology, Archaeological News Letter, Bulletin of the American Schools of Oriental Research, Bulletin de la Soc. Préhist. Française, Illustrated London News, Man, Nature, Revue Biblique, South African Archaeological Bulletin.* (R. J. B.)

Western Hemisphere.—W. F. Libby and J. R. Arnold of The University of Chicago Institute for Nuclear Studies announced the results of their work on the age determination of archaeological and geological specimens by the carbon-14 technique in *Science* (vol. 113 [no. 2927], pp. 111–120 [Feb. 2, 1951]). The significance of this series of dates and the degree of correlation with archaeological chronologies were discussed in a symposium published as memoir number 8 of the Society for American Archaeology. In general the correlation was very good, although some of the dates were quite surprising. A few dates appeared to be inconsistent with other carbon-14 dates or with the archaeological data, and probably were subject to some undetermined error. In addition to the dating laboratory at Chicago, other laboratories had been set up at Columbia university, the University of Michigan, Yale university and the University of California at Berkeley, but by the close of 1951 these had not yet announced results from their work.

Early Man.—With the new tool of radiocarbon dating, the archaeological studies of early man in North America were beginning to form a consistent pattern and also to assist in dating the last glacial maximum. Robert F. Heizer secured bat guano from the lower levels of Leonard rock shelter near Lovelock, Nev. This was mixed with gravels of a beach of Lake Lahontan and gave a date of 11,199 ± 570 years ago. Guano and artifacts obtained by Jesse D. Jennings from Danger cave, associated with an elevated beach of extinct Lake Stansbury in western Utah, dated almost exactly the same. Other dating for the Manketo maximum fell between 11,000 and 12,000 years ago and demonstrated that man was already in North America as the continental glaciers began to wane.

Glen L. Evans and Grayson E. Meade conducted excavations near Lubbock, Tex., in old pond deposits which revealed remains

SKULL RECONSTRUCTED from remains found in 1951 in the Hotu cave, northern Iran, by Carleton S. Coon of the University of Pennsylvania museum. Coon believed it to be about 75,000 years old

of extinct bison. Some of the bison bones had been charred and four classic Folsom points were found in place. Carbon-14 measurement of the burned bone gave an age of 9,883 ± 350 years, a date which was probably correct for Folsom culture.

Cultural remains were discovered by Junius Bird in 1936–37 associated with bones of extinct horses, ground sloth and guanaco bones in Palli Aike cave near the eastern end of the straits of Magellan. The charred bone from these deposits gave an elapsed time of 8,639 ± 450 years.

Sandals from Fort Rock cave in south central Oregon gave a measurement of 9,053 ± 350 years. This date was not only of importance to archaeology but also assisted in fixing the time of the Newberry volcanic eruption. This in turn would assist in estimating the age of cultural materials in near-by deposits lying beneath the same pumice.

Arctic.—A party of archaeologists from Harvard university, working under the leadership of Bertram Carter, excavated a series of sites near Point Barrow, Alaska, with excellent results. This party made use of the facilities of the Arctic Research laboratory of the office of naval research. At Kotzebue, James W. Van Stone of the University of Pennsylvania worked in a portion of the prehistoric site which was to be destroyed by an extension of the airstrip.

William E. Taylor of the University of Toronto, who worked with Henry Collins the year before, returned to Resolute bay, Cornwallis Island, to continue investigation of Thule and Dorset sites. In Hudson bay, Deric O'Bryan excavated Dorset sites on Mill Island with a grant from the Arctic Institute of North America.

Several radiocarbon dates were obtained for the Eskimo archaeological sequence. Wood from a house at Gamble, St. Lawrence Island, Alaska, assigned to the Old Bering Sea I or Okvik period, gave a date of 2,258 ± 230 years. Two dates were obtained for the Ipiutak period: one from the type site at Point Hope, Alaska, was 912 ± 170 years; the other, from a site near Deering on Seward peninsula, was 973 ± 170 years.

Pacific Coast.—Test excavations were made at Musqueam near the mouth of the Fraser river by Charles E. Borden of the University of British Columbia. The deposit was more than 11 ft. deep and extended well below the water table; unusually well-preserved perishable material was discovered. Excavations on a larger scale were planned for this site.

Douglas Osborne continued the excavations in the basin of the McNary reservoir near Pasco, Wash. Additional pit houses and burial sites were examined. This work, under the auspices of the University of Washington, Seattle, was a phase of the salvage operations of the River Basin surveys of the Bureau of American Ethnology, Smithsonian institution.

At the mouth of Willow creek, Monterey county, Calif., a site consisting of two shell midden layers separated by ten feet of water-laid gravel was excavated by Robert F. Heizer and ten students from the University of California. There was cultural difference between the layers and evidence of subsidence of the coast since the lower midden was deposited. A radiocarbon date from this level was 1,879 ± 250 years.

A. E. Treganza excavated in the Farmington reservoir area in Stanislaus county, under a contract agreement between the University of California and the national park service. All the sites examined produced heavy core and flake tools, and the nature of the sites suggested that they were fairly ancient.

Southwest.—The University of Colorado field session, under the direction of Robert H. Lister, excavated two caves and several open sites south of Grand Junction, Colo. The refuse in one of the caves contained pottery, but the other was entirely preceramic. Several of the open sites were deeply buried and apparently rather old. H. Marie Wormington of the Denver Museum of Natural History directed a party in the excavation of a rock shelter in the same vicinity as the University of Colorado excavations. Occupation debris extended to a depth of 13 ft. and contained a wide variety of projectile point types. The preceramic, preagricultural culture was similar to that found in two shelters in Montrose county, Colo., in 1938 and 1939.

In the Chaco Canyon National Monument, R. Gordon Vivian of the Southwestern Monuments organization directed the repair and stabilization of the ruin called "Yellow house." This work involved considerable excavation and a remarkable painted kiva was discovered which was to be sheltered to form an exhibit.

J. O. Brew and Watson Smith of the Peabody museum of Harvard university worked in the region south of Quemado, N. M. Paul Martin and John Rinaldo of the Chicago Natural History museum continued their program of research in Pine Lawn valley in southwestern New Mexico.

Charles DiPeso of the Amerind foundation excavated at the historic site of Quiburi and discovered a number of Spanish metal objects associated with Indian artifacts.

The University of Arizona field school, under the direction of Emil Haury, continued work at Point of Pines on the San Carlos Apache reservation. A series of sites was examined ranging from early Mogollon to late Pueblo remains, dating in the 14th or 15th century.

The 1951 Pecos conference was held at Point of Pines, Aug. 15–17. In addition to the usual summaries of archaeological field work, there were discussions of field work in ethnology and applied anthropology. There was also a discussion as to the significance of radiocarbon dates.

Plains.—The River Basin surveys of the Smithsonian institution had eight major field parties working in the Missouri basin in the summer of 1951: seven were engaged in the excavation of selected sites in areas to be flooded, and one party continued survey. Work in the Keyholes reservoir of eastern Wyoming was conducted by a Smithsonian party, and also by a second group headed by William T. Mulloy of the University of Wyoming, Laramie. One of the three sites excavated by Mulloy yielded artifacts similar to Signal Butte II. Two Smithsonian excavation parties worked in the Garrison reservoir area in North Dakota. One of these excavated Fort Stevenson, a frontier military post of the 19th century, and the other worked on prehistoric Indian sites. Indian contact-period sites were excavated in several other reservoir areas further down the Missouri valley.

The Nebraska State Historical society field party, under the direction of Martin Kivett, worked in South Dakota in the Fort Randall reservoir at an earth lodge village site. The contents of the houses suggested a culture related to the Lower Loup and the Talking Crow site. Carlyle Smith headed a party from the University of Kansas, Lawrence, which continued excavations begun in 1950 at the Talking Crow site.

Eastern United States.—The first group of carbon-14 dates released for sites in the eastern half of the continent contained several surprises. Hopewell culture specimens from Ohio and Illinois dated between 386 and 1 B.C., while dates for related Marksville period sites in Mississippi and Louisiana were A.D. 674 and 792. Adena sites of Ohio and Tchefuncte sites of Louisiana, thought to precede the Hopewell-Marksville culture in time, produced later dates.

Early Archaic sites in Kentucky and New York gave approximately equal dating measurements of about 5,000 years elapsed time. An old buried fishweir excavated from beneath Boylston street in Boston, Mass., several years earlier gave about the same measurement.

The Museum of Southern Illinois University, Carbondale, un-

ANIMAL FIGURINE of unbaked clay dating from the early village stage found at Jarmo, east central Iraq, in 1951, by an archaeological expedition headed by Robert Braidwood of the Oriental institute, The University of Chicago

der the direction of J. Charles Kelley excavated part of the deposit in a large rock shelter west of Murphysboro, Ill. The midden was more than one metre in depth and contained both Mississippi and Woodland remains. The Wisconsin Archaeological survey continued work at the Aztalan site and began the restoration of the large rectangular mound within the stockade.

The Royal Ontario Museum of Archaeology excavated an early Point Peninsular site at Lake Scugog under the direction of Kenneth Kidd. Pottery, bone and shell artifacts were found. E. F. Greenman of the University of Michigan continued excavations in the vicinity of Killarney, Ont.

The New York Science service and the State museum excavated sites in central and northern New York state. On the Seneca river a productive site yielded Owasco cultural material over late Point Peninsular. An early Laurentian site was dug on the upper Hudson river near Schuylerville, and near Catskill in the same valley a late Laurentian site was examined.

The Carnegie museum of Pittsburgh, Pa., was conducting an extensive survey of Pennsylvania under the direction of William J. Mayer-Oakes. Several mound sites had been discovered, and examination of local collections suggested Hopewellian and Adena-Middlesex influences.

The University of Georgia field session, under the direction of A. R. Kelly, worked on a late Kellog and early Cartersville period site on Pine Log creek in northern Georgia. Several caves were located which contained cultural material with Copena relationships. William Sears continued excavation in Kolomoki State park in southern Georgia and uncovered a number of burials accompanied by Weeden Island-type artifacts.

A joint field party from the American Museum of Natural History and Peabody museum dug at the Jaketown site near Belzoni, Miss. Beneath natural levee deposits of an old course of the Ohio river, a preceramic cultural complex was found which corresponded to that described from Poverty point, La.

Middle America.—Under the direction of the Instituto Nacional de Antropología y Historia, the Mexican government had begun an extensive program of restoration at the major sites of Chichen-Itza, Palenque, Tajín, Uxmal and Kabah. The annual round-table conference on Mesoamerican anthropology was held the last ten days in July at Jalapa, Veracruz, and the subject of discussion was "The Totonac, Huastec and Their Neighbors." The conference was well attended and the stimulating discussion dealt with both ethnological and archaeological aspects of the problem.

Radiocarbon tests from Archaic period sites in central Mexico ranged from 3,400 to 2,400 years ago. Apparently the earliest pyramidal mounds dated about 500 B.C.

The Museo de Arqueología y Etnología of Guatemala announced the formal inauguration of its sherd laboratories. Comprehensive files had been arranged representing the results of the work of the Carnegie institution, the Philadelphia museum and a number of private individuals.

In Colombia the Instituto Etnológico Nacional under the direction of Luis Duque Gomez excavated a late Chibcha site on the Hacienda Mondonedo, Municipio de Mosquera, in Cundinamarca. In the site there was a mound on top of which were found the outlines of a ceremonial building made of wood.

Ross T. Christianson completed excavations in the Piura valley in northern Peru. A habitation site at Chusís, about 400 m. square, was examined by means of stratigraphic tests in the refuse and a fairly simple culture was discovered showing no relationships to Inca or Mochica.

Radiocarbon dates for the north coast Peruvian sequence were summarized by Junius Bird in the memoir of the Society for American Archaeology referred to above. These data suggested that the preceramic Huaca Prieta site in Chicam valley was settled about 2550 B.C. and that the earliest ceramics, the beginning of the Guañape period, dated about 1225 B.C.

FILMS OF 1951.—*A Glimpse of the Past* (Educational Film Library Assoc.); *Peruvian Archaeology* (Pan American Union, Motion Picture Service). (J. A. FD.)

Archery.

The 67th annual tournament of the National Archery association of the United States was held at Los Angeles, Calif., on the campus of the University of California, Aug. 13–17, 1951. One hundred sixty-three archers from 14 states, Belgium and Canada participated. Twenty-six new national records were established. The champions and their scores are shown in the table.

The Phoenician Archers (Phoenix, Ariz.) with a team of four men won the men's team round (96 arrows at 60 yd.) event.

Target Archery

Men's championship		Russ Reynolds, Cleveland, O.	
Scores:	Double York round	287–1,751	
	Double American round	180–1,426	3,177
Ladies' championship		Jean Lee, Greenfield, Mass.	
Scores:	Double National round	144–1,070	
	Double Columbia round	144–1,176	
	Double American round	180–1,454	3,700
Junior boys' championship		Jerry Hash, Long Beach, Calif.	
Scores:	Double Hereford round	284–1,878*	
	Double American round	180–1,328	3,206
Junior girls' championship		Laurette A. Young, Detroit, Mich.	
Scores:	Double National round	142–960*	
	Double Columbia round	144–1,130	
	Double American round	178–1,286	3,376

Crossbow

Men's championship		Walter Palkowski, Los Angeles, Calif.	
Scores:	Double American round	180–1,368	
	Double American round	180–1,372	2,740
Ladies' championship		Mrs. Dixie Tyler, Fullerton, Calif.	
Scores:	Double American round	175–1,019	
	Double American round	177–1,047	2,066

Flight Archery

Men	Regular style	Harry Drake, Lakeside, Calif.	623 yd.
Ladies	Regular style	Mrs. Henry Bitzenberger, Rivera, Calif.	395 yd. 2 ft.
Boys	Regular style	James Easton, Los Angeles, Calif.	432 yd.

Clout Shoot

Men	(36 arrows at 180 yd.)	Max Hamilton, Phoenix, Ariz.	36–288*
Ladies	(36 arrows at 140 yd.)	Mrs. Jean Richards, Laguna Beach, Calif.	36–280*
Ladies	(36 arrows at 120 yd.)	Jean Lee, Greenfield, Mass.	36–310*
Boys	(36 arrows at 120 yd.)	Bert Corley, Long Beach, Calif.	36–300*
Girls	(36 arrows at 120 yd.)	Lorna Price, Phoenix, Ariz.	36–278*

Field Archery

Men's championship	Reuben Powell, San Diego, Calif.	2,547
Ladies' championship	Mrs. Eleanore Hamilton, Garfield Heights, O.	1,796
Boys' championship	William Hicks, Glendale, Calif.	2,379
Girls' championship	Janet Laitis, Allen Park, Mich.	1,218

*Indicates new record.

their combined scores totalling 383–2,623. The United Archers of Whittier, Calif., won the ladies' team round (96 arrows at 50 yd.) event with a score of 380–2,640, exceeding the previous record by 25 points.

Mrs. Ann Weber Corby of Denville, N.J., established a new world record for the Hereford round with 143 hits for a score of 1,017—96 points higher than the previous record.

The National Field Archery tournament was held Aug. 21–24, 1951, in Watkins Glen, N.Y.

The 68th annual tournament of the National Archery association was to be held at Jackson, Mich., Aug. 4–8, 1952.

The 15th world championship tournament, held biennially, was to take place in Brussels, Belg., July 23–28, 1952. (O. U. C.)

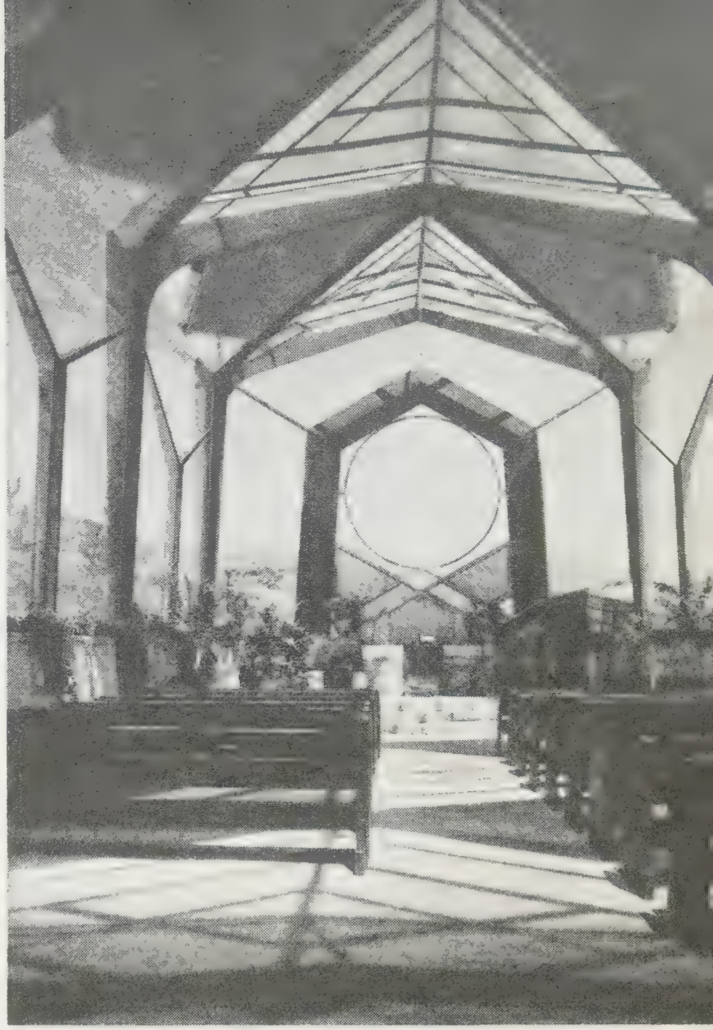
Architecture.

At the beginning of 1951, the impact of the international situation on the architectural profession was forecast, by the third quarter of the year the pattern became clarified and toward the end of the year was developed sufficiently to enable the profession to begin to foresee a possibility of resumption of normal activity after the first six months of 1952.

The situation in the profession at the beginning of 1951 can be described only as confusing in the extreme, as evidenced by the drastic curtailment of work in some of the offices and by greatly increased work in others. Certain elements of the clientele of the profession found themselves, if not immediately restricted by the controls on building, at least so intimidated by the possibility as to lessen their demands for design service. At the same time, professional services for the national defense construction program were in great demand. The hesitancy to engage architects for commercial and recreational building can be readily understood. And the hesitancy on the part of the architects to encourage clients to proceed with planning when they, the architects, could not assure a client that the plans could be realized in actual structure can be likewise understood. However, the large architectural firms, geared to design huge projects, especially for the defense construction program, found themselves deluged with work, resulting in some cases in doubling the size of their offices.

On the whole the income of the profession in 1951 held up fairly well and showed little decrease below 1950. This could be attributed, presumably, to the continuance of some work already on the boards and to the receipt of payments in 1951 for services rendered previously. As the year progressed, it became increasingly difficult for the architectural profession to indicate to the client even the approximate cost of contemplated structures. The profession, realizing the condition of the economy, which included a definite lack of promise for any but industrial and defense work, turned as best they could to those two avenues of engagement.

Thereupon, the profession's concern for improving the procedures and methods of negotiating for governmental contracts became paramount. At the same time, those governmental agencies concerned with the defense construction program (totalling billions of dollars) found themselves confronted suddenly with a great volume of large design contracts and an influx of eager and able professionals. Both architect and client found it necessary to give serious attention to perfecting methods of negotiation service and to establishing appropriate fees which would recognize the value of skill, as well as size of drafting forces and physical equipment.



WAYFARER'S CHAPEL designed by Lloyd Wright and completed at Palos Verdes, Calif., in 1951. The glass-enclosed structure was built on a bluff overlooking the Pacific ocean, a setting meant to approximate the spirit of the first Christian sermons at the Sea of Galilee

Despite a situation ill-suited to advancing architecture as an art, some significant advances were made in 1951, especially in the design of schools and hospitals. Progress in the design of school buildings was both extraordinary and revolutionary, and examples of unusual architectural interest were legion. To cite a few: the work of Lawrence B. Perkins and Philip Will, Jr., in the Chicago, Ill., area; of Ernest Kump in and about San Francisco, Calif.; of Henry Wright in southern California; of Walter Bogner and Carlton Richmond in Massachusetts; of Maloney and Whitney in the northwest; and of Bomberger and Reid in California.

The hospital field was marked by constant improvement in planning and in mechanical development, and here again the contributions of the profession to this special branch of architecture were outstanding. To cite a few examples: the Maimonides Health centre, San Francisco, by Eric Mendelsohn; the work of Loebl, Schlossman and Bennett in Chicago; Magney, Tusler and Setter in Minneapolis, Minn.; James R. Edmunds, Jr., in Baltimore, Md.; and Erhart, Eichenbaum and Rauch in Little Rock, Ark. The contribution of the U.S. public health service, through its division of hospital facilities, technical services branch, to the advancement of hospital construction and hospital planning was of great significance.

In the residential field, little was accomplished in what might be called luxury housing. Excellent modern houses were designed and built in 1951 in various parts of the United States, however, giving definite indication of a new outlook on the part of the public for a way of living. Unfortunately, this advance was not reflected to any great extent in the mass of new dwellings in the low- or the middle-income groups where, except in rare instances, no improvement in the design for living was to be found. It had been long assumed that the reason for this lack of advance lay in the inherent conservatism of the people. This might be a contributing factor, but there were many who held that the public had not been given the opportunity to become acquainted with a more enlightened form of living, not because of any inherent conservatism on the part of the public but because of the timid and unimaginative attitude of the financiers.

The rapid growth of metropolitan areas since World War II became especially pronounced in 1951, and people were beginning to question the desirability of greater extensions of cities. At the same time, it was realized that because of the rapid growth in population the problem of urban planning was no longer one which could be met by the production of dreams for the "city beautiful." In fact, it was doubtful if any comprehensive planning could be engaged in that did not take into account as its initial problem a very great population growth. This, in a curious way, brought about a lessening of interest in public housing as a possible dominant factor in city planning, a feature which not long before had played an all-important part in urban development, including the reclamation of blighted areas.

Architecturally, designs for public housing did not come up to the expectation of the local authorities and the federal agencies. The responsibility for disappointing design was attributed by the architects to the restrictions of criteria established by the federal agencies, the high cost of construction and the discouragement of the designer in attempting to carry projects of advanced architectural thinking through the maze of governmental red-tape. Architects fell back upon established designs well within the federal criteria in order to free themselves for engagement upon other work of greater architectural promise. The governmental authorities on their part expressed disappointment that unusual and brilliant design had not been forthcoming.

It could be argued that the blighting hand of bureaucratic domination had not and never would stimulate architectural progress. Unquestionably, the physical lot of the income classes for whom public housing projects were planned would be improved by the projects which were on the boards, but there was grave question that the solution of the problem, as evidenced in some of the public housing projects in the great metropolitan centres, would afford the inhabitants of the projects anything but a physically improved standard of living. The American Institute of Architects, working in conjunction with the National Association of Housing Officials and the Public Housing administration of the U.S. government, undertook the task, among other things, of reviving an approach to the problem calculated to produce something besides a stereotyped collection of housing units.

In 1951, because of the drastic curtailment of the public buildings program, there were few outstanding examples of governmental work. The general accounting office in Washington, D.C., designed by the public buildings service, was perhaps the only significant building in this category completed during the year. This building was one of the first of the so-called block type of building. It occupied an entire city block, which was completely covered with the building. Although still in the experimental stage, this type of building was being carefully studied as the solution to housing a great many workers in one spot without recourse to the skyscraper type of structure.

To sum up, it can be said that, by force of circumstances, 1951 cannot be regarded as a year which saw completion of much of architectural note. It was a year of industrial expansion to increase the capacity for further construction and a year in which the talents of the profession had to be largely devoted to the production of design geared to the defense effort. (Ed. R. P.)

Great Britain.—The Festival of Britain South Bank exhibition (May 3–September 30) alone made 1951 a historic year for contemporary English architecture. Though none of the buildings in themselves were of revolutionary significance, most of them showed imagination, daring, wit and ingenuity. All informed critics agreed that the important aspect of the exhibition was the ensemble, which gave to what was in fact a very small site (27 ac.) an appearance of great spaciousness. The only permanent building on the south bank of the Thames, the Royal Festival hall, was opened by the king and queen on May 3. Since it had to be designed and erected to a close timetable (the actual construction took just under two years) the architects (R. H. Matthew and J. L. Martin with Edwin Williams and Peter Moro as senior and associate architects, respectively) avoided structural experiment. The framework was of reinforced concrete with panel infilling, except for the auditorium which had double reinforced concrete walls, each 10 in. thick, with a 12-in. cavity between. The floor and roof of the auditorium were also double, the latter being constructed in the shape of a tied concrete barrel vault supported on the inner wall.

At Lansbury, Poplar, in the East End of London was held the Festival of Britain "live architecture" exhibition. The development of this 30-ac. site represented the first instalment of the County of London plan. It would form a quarter of the final Lansbury neighbourhood, which would itself be one of 11 neighbourhoods in the reconstructed Stepney-Poplar district. The two chief buildings in it, completed in 1951, were a primary school designed by F. R. S. Yorke, E. Rosenberg and C. S. Mardall, and a Congregational church by Cecil Handisyde and D. Rogers Stark.

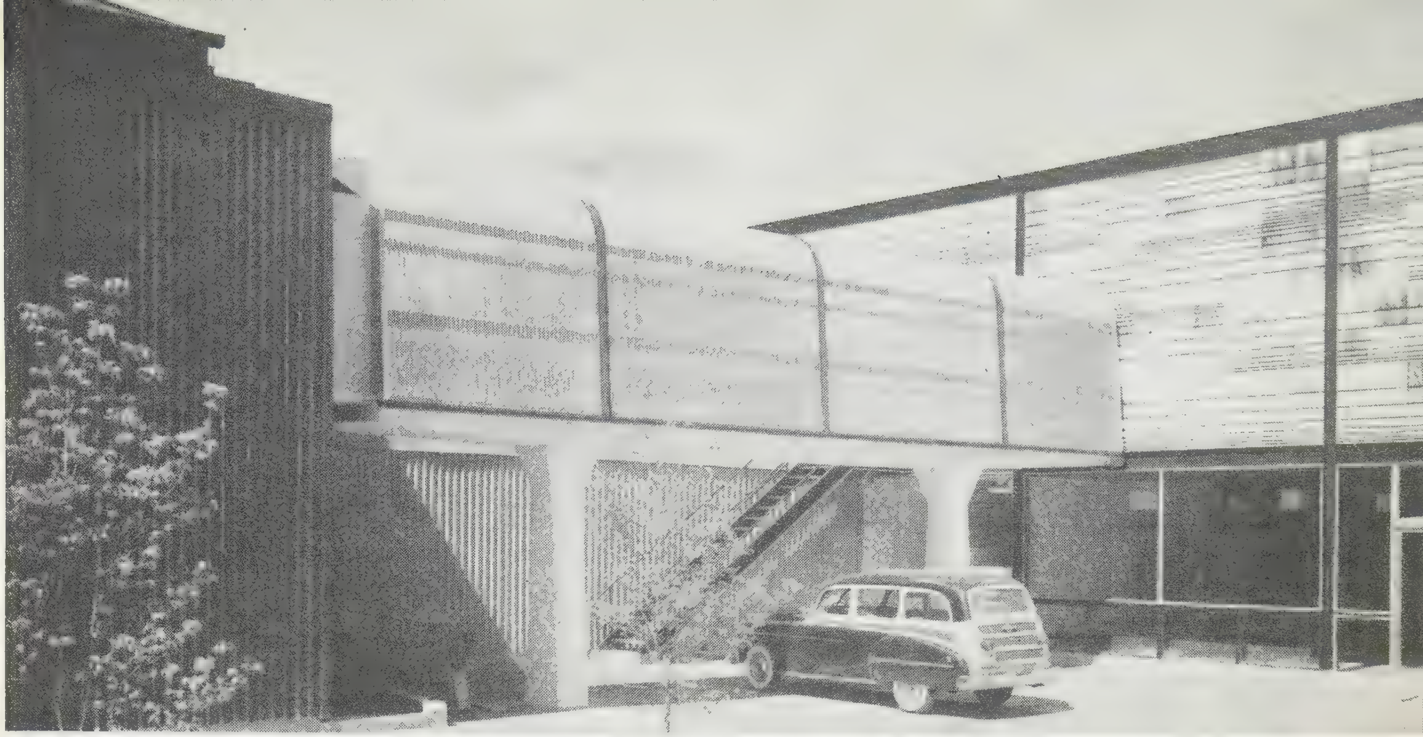
A housing scheme in Busaco street, London, for the Finsbury borough council was completed to the designs of Lubetkin, Skinner and Drake ("Tecton"). This scheme which comprised 270 flats (95 would be built later) showed in its design a further development of the principles which this firm of architects had been developing over a number of years starting at Highpoint, Highgate, in 1935. By employing at Busaco street a method of construction introduced into England from Denmark after World War II and sometimes called the box-frame system, the architects eliminated all projecting stanchions and beams.

Results of the competition for the new Coventry cathedral were announced. The architect of the winning design was Basil Spence. In addition to the new cathedral itself with its chapter house and chapels, there would be a Christian service centre.

In July the eighth of the annual Congrès Internationaux d'Architecture Moderne was held at Hoddesdon, Herts., Eng. The theme was "the core" (or town centre), and among those who attended were Le Corbusier, Walter Gropius, Siegfried Giedion, J. L. Sert and Alfred Roth.

Canada.—At the end of 1950 the first awards of Massey medals for architecture were announced. Eight silver medals were awarded and the gold medal for the best of all the buildings entered went to the firm of John B. Parkin Associates for the Oshawa High school, Oshawa, Ont.

Australia.—The most notable work in Australia was in the field of small house design. Among larger buildings worth mentioning were the Hayman Island hotel, designed by Guildford Bell, and a pavilion-type hotel on a semitropical island in the Whitsunday passage off the north Queensland coast.



CONNECTING BRIDGE of the Glass centre completed in 1951 at the Corning Glass works, Corning, N.Y. The passageway was enclosed entirely with bent Pyrex tubing separated by gaskets and connected the blowing room with the Auditorium building at right. Architects: Harrison, Abramovitz and Abbe

Europe.—One of the first flat blocks of its kind was completed in Gladsaxe, 6 mi. N.W. of Copenhagen, Den. It was financed by a building society to house families where both parents worked away from home. It therefore included, in addition to the flats themselves, a common kitchen and restaurant, a nursery and a laundry. There were five stories built to a Z-shaped plan, with a large garden on one side. Walls were of solid brick, dark red in colour, and balconies were of precast concrete, rendered white. The architects were Paul Ernst Hoff and Bennet Windinge.

In Italy the three buildings completed in 1951 most worth recording were the Textile exchange at Pistoia, constructed of reinforced concrete and faced with stone (architect, Giovanni Michelucci); an orthopaedic hospital at Bari by Guiseppe Samona; and a youth hostel at Cervinia in the Val d'Aosta constructed of wood and stone (architect, Franco Albini). The architectural event of the year in Italy was the ninth *Triennale* held in Milan from June to October. In addition to the central exhibition there was also "QT8," an international experimental quarter on the outskirts of the city, started at the time of the 1947 *Triennale* and forming part of the general plan for Milan; it included housing of many types as well as community buildings.

In Zürich, Switz., the Felix and Regula church by Fritz Metzger was completed. The main roof was an oval shell-concrete dome 72 ft. across at its widest span and 5 ft. 4 in. high. It was supported on sloping concentric columns and the enormous horizontal thrust was countered by a circular cable. The inauguration of the largest structure in Switzerland, the Zürich Cantonal hospital designed by a team of architects headed by Rudolf Steiger, took place in July.

In Paris, Fr., a new building was erected as the headquarters of the French Master Builders' federation. It was a five-story building consisting of continuous reinforced-concrete floor slabs, supported on reinforced-concrete columns, and cantilevered out ten feet on the two long sides. The walls on these sides were of prefabricated aluminum wall panels, brought to the site ready glazed and painted and inserted at the rate of one story each day. The end walls were faced with Oise stone laid in courses of varying depth. (*See* also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING; TOWN AND REGIONAL PLANNING.)

Areas and Populations of the Countries of the World.

The political entities of the world are listed here with their areas, populations and number of persons per square mile. The latest census or official estimates are given for each country. Areas in square miles are in accordance with the boundaries for the year of the population figure unless otherwise noted. Some of the later boundary adjustments had not been recognized at the end of 1951 by the U.S. government. The subtotals for colonial groupings within continents do not carry density figures.

Where two figures are given for a country, the most recent is used in the continental and world totals.

The table, on this and the following page, provides a fundamental basis for country comparisons.

Areas and Populations of the Countries of the World

(For statistical details and dates see separate country and empire articles)

Name of continent and state	Area (in sq.mi.)	Population (in thousands)	Persons per sq.mi.
World total	58,209,392	2,409,108	46.1*
AFRICA	11,596,222	182,287	15.7
Belgian colony and trusteeship	925,094	14,929	
†British colonies, dependencies, protectorates, trusteeships and condominium	3,045,539	67,724	
Egypt	383,000	20,439	53.4
Ethiopia	350,000	10,000	28.6
French colonies, trusteeships, protectorates, departments and overseas territories	4,252,124	50,324	
Italian trusteeship	198,000	972	4.9
Liberia	43,000	1,350	31.4
Libya	679,340	1,191	1.8
Portuguese colonies	794,959	10,561	
South-West Africa (mandate of Union of South Africa)	317,725	430	1.4
Spanish colonies and protectorate	134,715	1,610	
Tangier, International Zone of	232	111	478.4
Union of South Africa	472,494	12,646	26.8
ANTARCTICA	6,000,000	Uninhabited	
ASIA (exclusive of U.S.S.R.)	10,575,223	1,288,764	121.9
Afghanistan	270,000	12,000	44.4
Arabian desert	193,000	Largely uninhabited	
Bhutan	18,000	300	16.7
British colonies, dependencies, protectorates, protected state and independent state under British protection	245,932	10,453	
Burma	261,749	18,489	70.6

Areas and Populations of the Countries of the World—Continued

Name of continent and state	Area (in sq.mi.)	Population (in thousands)	Persons per sq.mi.
Ceylon, Dominion of	25,332	7,639	301.6
China (35 provinces, including Formosa, Kwantung and South Manchurian railway, Manchuria and Tibet)	3,876,956	475,000	122.5

‡Areas and populations of Baltic republics included in 1950 U.S.S.R. totals.

Argentina. A republic occupying the southeasternmost section of South America, Argentina is bounded on the north by Paraguay, Bolivia and Brazil; on the south and west by Chile; and on the east by Uruguay, the River Plate and the Atlantic ocean. It is the second largest Latin-American nation—only Brazil is larger—with an area of 1,079,965 sq.mi. and a population of 17,424,926 (est. 1950), mostly of European ancestry. The capital and leading port, Buenos Aires, has 3,371,000 inhabitants (est. 1950). Other leading cities are: Rosario, 467,937; Córdoba, 369,886; Avellaneda, 279,572; La Plata, 271,738; Lanús, 242,760; Tucumán, 194,166; Santa Fé, 168,791; Lomar de Zamora, 125,943; Mar del Plata, 114,729; Mendoza, 105,328; and Bahía Blanca, 112,597. Religion: Christian, mostly Roman Catholic. President: Gen. Juan D. Perón (*q.v.*).

History.—During 1951 Argentine history was marked by labour unrest, political agitation and economic instability, but the Perón regime managed to maintain itself in power and to crush all opposition. In the economic field Argentina's vital exports, mostly meat and cattle products, were reduced; its over-all trade balance was unfavourable; its gold and foreign exchange assets were less than $500,000,000; the currency, although legally fixed at 14 pesos to the dollar, actually sold at 28 pesos to the dollar in the free market; and there were signs of inflation and shortages in meat, fuel, machinery and newsprint. These difficulties were attributed in part to the government policy of buying agricultural products at a low price from the farmer and selling them at high prices in the international market, and also to drought and erosion. The government tried to cut down on agricultural production and increase industrial output, but the outcome was not favourable.

In January the Buenos Aires railwaymen went on strike, requesting higher wages and better working conditions. Perón called on the military, declared strikers subject to martial law and broke the strike. In August La Fraternidad, the union of railway engineers and firemen, which had been in existence more than 64 years and had 10,000 members, went on strike. Earlier Perón had forced the resignation of the union's elected officials. Bridges were blown up and signal systems destroyed. Again martial law was invoked and the strike broken. This apparently silenced the last anti-Perón labour organization in Argentina. Perón made political capital by charging that the strikes were foreign-inspired.

La Prensa, one of Argentina's two leading independent newspapers, editorialized on the January strike and as a result the government decided to shut it down. An alleged boycott by the news vendors in late January brought about a series of riots in which 1 employee was killed and 14 were injured. As a result of the disorders the government intervened and confiscated the property. Alberto Gainza Paz, editor-publisher of *La Prensa,* fled to Uruguay and later toured the western hemisphere expounding his case, after having been indicted by the government. On May day Perón gave *La Prensa* to the General Confederation of Labour and in November the first issue appeared under the new editor, Martiniano Pasos, former editor of *La Democracia,* Eva Perón's daily.

TURBULENCE AND ITS AFTERMATH around the Buenos Aires offices of *La Prensa,* independent newspaper forced to close down in 1951. Left: wounded employee being rushed from the street battle after an attempt by *La Prensa* workers to resume publication in February; right: *La Prensa* office bedecked with portraits of Juan and Eva Perón after government seizure of the plant in March

In April Argentina signed a new trade agreement with Great Britain. This agreement supplemented the 1949 trade pact and was to be in effect 12 months. The price of meat was greatly increased but in exchange British investors were permitted to transfer funds to their home country. Argentine relations with the United States remained cold and distant, although a new U.S. ambassador, Ellsworth Bunker, tried to improve them.

In March Perón announced that an Austrian-born physicist, Ronald Richter, working for the Argentine government, had discovered an inexpensive and simple method of producing the controlled release of atomic energy. Scientists throughout the world were sceptical. Richter later admitted that the thermonuclear process for the release of atomic energy, although successful in the laboratory, might not produce proportionate results on a larger scale.

The presidential elections to be held in Feb. 1952 were moved up to Nov. 11, 1951. It was also decreed that the president would be elected by popular vote rather than by an electoral college. The Peronistas demanded that Eva Perón run for vice-president on a ticket headed by her husband, but this would have made her commander in chief of the armed forces in the absence of her husband, and high military leaders were reported to have vetoed her candidacy. Señora Perón refused to run and was awarded the Peronista medal. The Peronista party renominated General Perón and Vice-Pres. Hortensio Quijano. The Radicals, leading opposition party, nominated Deputies Ricardo Balbín and Arturo Frondizi, outstanding opposition leaders from Buenos Aires, who had been jailed by the government. The Democrats nominated Reynaldo A. Pastor, their only deputy in congress, for president and Vicente Solano Lima for vice-president. The Socialists nominated Alfredo Palacios and Américo Chioldi and the Communists, Rodolfo Ghioldi and Señora de la Pena.

During the campaign Perón took leave of absence and won by a two-to-one margin over the opposition, which was not allowed radio time or freedom of speech, press or assembly. During the year, Perón conducted an extensive purge of the armed forces, removing nine top generals, among them Chief of Staff Angel Solari, and more than 100 lesser officers. (J. McAd.)

Education.—In 1949 there were 14,649 primary schools, with 2,074,233 pupils and 91,024 teachers. The 744 secondary, normal and special schools had 185,283 students; they included 136 national colleges with 44,901 students, 219 national normal schools with 67,968 students and 91 national commercial schools with 25,973 students. The 670 incorporated (*i.e.,* private) secondary, normal and special schools had 55,693 students. There were national universities at Buenos Aires (34,988 students), La Plata (18,181), Córdoba (8,881), Cuyo (6,749), Tucumán (2,308), the national university of the Litoral at Santa Fé (17,716) and the technical institute at Bahía Blanca (254). In 1951 there were 2,190 motion-picture theatres with seating capacity of 957,209.

Finance.—The monetary unit is the peso, valued on Nov. 22, 1951, at $0.1333 U.S. currency, basic rate, $0.2000, preferential rate and $0.0688, free market rate. The 1952 budget was approved by congress at the same time as the 1951 budget in Aug. 1950 and was substantially the same as that budget. It totalled 13,073,900,000 pesos, distributed as follows: national administration 4,844,000,000 pesos; public works 1,059,600,000 pesos; autonomous agencies 5,987,900,000 pesos; special accounts 1,182,400,000 pesos. In addition, about 1,300,000,000 pesos were allocated for the five-year plan. Expenditure of the national administration amounted to 5,102,300,000 pesos in 1950; general revenue was 5,202,300,000 pesos. The national debt was 18,158,400,000 pesos on Dec. 31, 1950 (Dec. 31, 1949: 15,194,500,000 pesos), of which 15,996,900,000 pesos represented the funded debt and 2,161,500,000 pesos the short-term floating debt. The debt figures did not include the floating debt at call or the debt of the official agencies and of provincial and municipal governments. Currency and subsidiary money in circulation on Aug. 31, 1951, totalled 13,068,000,000 pesos and on that date the Central bank had gold holdings of $288,000,000.

Trade and Communications.—Exports in 1950 were officially valued at 5,427,300,000 pesos and imports at 4,821,100,000 pesos (provisional figures). Leading exports were cereals and linseed (21.4%), wool (16.1%), hides (12.7%), meat (10.9%) and livestock by-products (5.4%); leading imports, machinery and vehicles (20.0%), iron and steel and manufactures (15.5%), fuel and lubricants (12.3%), textiles and manufactures (11.7%) and lumber (7.7%). Leading customers were the U.S. (20.4%), the United Kingdom (17.9%), Brazil (7.9%), Italy (6.6%) and France (6.5%); leading suppliers, the U.S. (16.3%), France (14.5%), the United Kingdom (11.8%), Brazil (9.5%) and Italy (7.2%).

Railway mileage (1949) totalled 26,923, and that of the national highways about 43,500. Registered motor vehicles on Jan. 1, 1951, included 275,000 cars, 140,000 trucks and 16,000 buses. According to *Lloyd's Register of Shipping,* the merchant marine (June 30, 1950) consisted of 369 steamers and motorships (100 tons and over) aggregating 913,517 gross tons.

Agriculture.—Production figures for the crop year 1950–51 were unofficially reported as follows (in short tons): wheat 6,050,000; rye 456,500; barley 770,000; oats 760,000. Exports during the period Jan. 1-Sept. 30, 1951, were estimated in short tons as follows (total for entire year 1950 in parentheses): wheat 2,415,091 (3,048,770); maize 152,758 (877,913); linseed 184,389 (144,079); oats 76,241 (428,910); barley 76,364 (102,750).

The livestock census of July 1, 1947, showed 41,268,470 cattle, 7,237,663 horses, 50,856,556 sheep, 2,981,406 pigs and 4,933,679 goats. Wool exports in the wool year ending Sept. 30, 1951, were 191,091 bales, of which 93,458 went to the U.S. In 1950 there were exported 2,642,469 frozen beef quarters, 232,220 mutton carcasses, 1,147,489 lamb carcasses, 126,486 short tons of canned meat, 7,234,688 salted ox hides, 971,693 dried ox hides and 2,582,777 calf skins. Quebracho extract exports totalled 276,755 short tons.

Manufactures.—Industrial establishments numbered 101,884 in 1947 (65,803 in 1943). Industrial employment in June 1950 totalled 917,700, of whom 210,600 were employed in the food and beverage industries and 132,900 in the textile industry. Estimated production data in 1950 included cement 1,705,000 short tons; flour 2,160,000 short tons, cotton yarn 83,000 short tons; electric energy 4,428,000,000 kw.hr.

Mineral Production.—Petroleum production totalled 23,353,000 bbl. in 1950. Gold, lead, zinc, copper, tin and coal were also produced. Coal and coke imports in 1950 amounted to 1,447,838 long tons, of which 976,213 tons came from the United Kingdom and 130,452 tons from the Union of South Africa.

BIBLIOGRAPHY.—*Review of the River Plate* (Buenos Aires); Bank of London and South America, *Fortnightly Review* (London); *Sintesis Estadistica Mensual* (Buenos Aires). (J. W. Mw.)

Arizona.

Arizona, nicknamed the "Grand Canyon state," lies in the southwestern part of the United States; the

Colorado river forms most of the western boundary. The official census of 1950 reported a land area of 113,575 sq.mi. and a population of 749,587, the latter figure an increase of 50.1% over 1940. The rural population was 44.5% and the urban, 55.5%. The 1940 census reported foreign-born whites (including Mexicans), 7.3%; other races including Indians, 14.4%. The capital, Phoenix, had (1950) a population of 106,818. Other cities were: Tucson, 45,454; Mesa, 16,790; Douglas, 9,442; Yuma, 9,145; Glendale, 8,179; Tempe, 7,684; Flagstaff, 7,663; and Prescott, 6,764.

History.—The state officers (1951) were: chief justice, Levi S. Udall; governor, J. Howard Pyle; secretary of state, Wesley Bolin; treasurer, E. T. Williams, Jr.; attorney general, Fred O. Wilson; superintendent of public instruction, Marion L. Brooks. All officials were Democrats except the Republican governor. The 20th legislature consisted of an entirely Democratic senate, a Republican governor and 11 Republicans out of 72 members of the house of representatives. Among the major bills passed were the following: making local school boards responsible for deciding whether Negro and white pupils should be segregated; regulating the granting of licences to drivers of motor vehicles in order to secure greater safety; providing for issuing leases of state land to develop oil and gas production; and licensing of artificial producers of rain. A short second session was called in June to reappropriate funds of the first session made illegal by a signed referendum plan for governmental reorganization.

Education.—The net enrolment and the number of teachers in the public schools for 1950–51 were reported respectively as follows: elementary schools, 129,689 and 3,959; high schools, 31,639 and 1,370. There were 12 accredited private secondary schools, and a number of nonaccredited secondary schools. In addition, there were parochial secondary and elementary, together with private elementary schools.

Social Insurance and Assistance, Public Welfare and Related Programs.—The total number of recipients of state assistance for Oct. 1951 was 20,257. The state welfare appropriations for 1951 were: children's colony, $100,000; industrial school, $150,000; state hospital, $1,308,900; state tuberculosis sanatorium, $210,195; crippled children service, $265,500; pioneer home, $133,112; prison, $419,623.50; aid to the blind, $316,350; aid to dependent children, $1,272,240; old-age assistance, $3,555,900.

Communications.—Statements of the Arizona highway department as to mileage for 1951 were as follows: state highways, 3,921; county roads, 15,253; federal aid highways, 2,486; national roads, 8,066. Railroad mileage at the beginning of 1951 was 2,566. There was a total of seven telephone companies with 170,422 subscribers.

Banking and Finance.—National banks, June 30, 1951, had deposits of $353,896,364; loans and discounts, $169,041,255; U.S. government securities, $108,601,427. State banks had deposits of $128,012,945; loans and discounts, $38,569,029; U.S. government securities, $58,324,175, all figures an increase over the previous year except government securities in national banks. The treasurer's report for the fiscal year ending June 30, 1951, showed receipts of $120,759,475.89 and expenditures of $111,064,580.30. The 1950 gross debt of the state was $3,538,000; net debt, $3,228,000.

Agriculture.—Because of the high price of cotton, the acreage planted in cotton in 1951 was 102% greater than in 1950. In places the ground water level had dropped 230 ft. because of pumping for irrigation, and presented a real problem.

Table I.—*Principal Crops of Arizona*

	1951	1950	Average, 1940–49
Barley, bu.	4,900,000	7,850,000	3,037,000

Stone	356,050	203,295	228,490	139,810
Zinc	70,658	17,523,184	60,480	17,176,320
Other minerals		986,067		?
Total		181,094,831		?

Manufacturing.—Several government plants were established in 1951 for defense production. In Aug. 1951 the number employed in defense production plants was 18,800, an increase of 3,600 over 1950. (H. A. H.)

Mineral Production.—Table II shows the tonnage and value of those items of mineral production in the state in 1949 for which the value exceeded $100,000, and the corresponding data for 1950, so far as they were available at the close of 1951. Arizona ranks first among the states as a copper producer, second in zinc and fourth in silver and lead.

Arkansas.

Arkansas, a south central state of the United States, was admitted to the union in 1836. Termed the "Wonder state," its area is 53,104 sq.mi., including 429 sq.mi. of water. The population was 1,909,511 according to the 1950 census. Indications were that the 1950 population was 67% rural. The Negro population was 428,003 or 22% of the total.

Little Rock, the capital city, had 102,213 inhabitants in 1950. Other cities with their populations were: Fort Smith, 47,942; North Little Rock, 44,097; Pine Bluff, 37,162; Hot Springs, 29,307; El Dorado, 23,076; Fayetteville, 17,071; Jonesboro, 16,310; Blytheville, 16,234; Texarkana, 15,875.

History.—The 58th general assembly met in regular session Jan. 8 to March 8, 1951, and approved 417 of the 966 bills introduced. It defeated 132. Fourteen of the approved measures were vetoed by Gov. Sidney McMath. Governor McMath in his second inaugural address called for a four-point program to provide $17,000,000 a year in new revenue. The session's first new revenue measure placed an additional 2-cent tax on a packet of cigarettes to provide about $2,000,000 a year for a projected medical centre and for the public schools. The second and last revenue bill to have legislative endorsement was passed the final day of the session increasing liquor taxes which would be absorbed by the wholesaler, expected to produce $750,000. This money was earmarked for the Institutional fund.

Attempts in the legislature to increase the 2% sales tax, the severance tax and the gasoline tax and to establish an unprecedented levy on soft drinks all failed.

In the last days of the session the general assembly appropriated approximately $61,000,000 for the common schools during the next (1951–52, 1952–53) fiscal biennium, although it recognized that probably only about $46,000,000 could be anticipated at current revenue levels.

However, it adopted two important measures designed to ameliorate the school dilemma: (1) a proposal to allocate school aid on the basis of a new formula designed to place more school responsibility on the local level; (2) another measure calling for a study by the legislative council of the school system in Arkansas.

Governor McMath summoned the general assembly into special session on April 9, 1951, on a ten-point call: schools, public welfare, public institutions, new Confederate home, civil defense, an emergency fund, state livestock show construction, legislative expenses, loans to medical students and an appropriation to pay expenses of utility regulation. The legislature acted favourably on several of these points but failed to approve the crucial 1-cent sales tax increase for school purposes, and it adjourned nine days later.

The principal state officers in 1951: Sidney McMath, governor; Nathan Gordon, lieutenant governor; Ike Murry, attorney general; C. G. Hall, secretary of state; J. Oscar Humphrey, auditor; J. Vance Clayton, treasurer; Claude Rankin, land commissioner.

Education.—There were about 1,900 elementary schools in Arkansas during the year ending June 30, 1951, and 600 secondary schools. Elementary school enrolment was 300,918 and secondary school enrolment was 142,000 (preliminary estimates). Teachers and principals in elementary schools numbered 8,309; in secondary schools 5,406. Expenditures from state public funds for the year ending June 30, 1951, to school districts amounted to $26,271,590.89. Student transportation, a program to benefit handicapped children and the school lunch program were sig-

Table I.—*Principal Crops of Arkansas*

Crop	1951	1950	Average 1940–49
Corn, bu.	23,218,000	32,242,000	30,989,000
Cotton, bales	1,255,000	1,090,000	1,414,000
Cottonseed, tons	504,000	448,000	579,000
Hay, tons	1,294,000	1,319,000	1,613,000
Rice, 100-lb. bags	9,011,000	7,780,000	6,525,000
Soybeans, bu.	12,444,000	12,492,000	3,506,000
Oats, bu.	3,050,000	5,040,000	7,684,000
Potatoes, bu.	1,106,000	1,740,000	3,100,000
Sweet potatoes, bu.	518,000	946,000	1,669,000

nificantly expanded in 1951. A. B. Bonds, Jr., was commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—Old-age assistance grants during the calendar year 1951 were paid in the amount of $20,264,926 to a monthly average of 67,927 recipients. A monthly average of 17,731 families received a total of $8,567,707 for dependent children; an average of 2,021 blind recipients were paid a total of $719,984; an average of 2,582 general relief cases received approximately $400,075. Unemployment benefits of $7,370,196 were paid during the year, a weekly average of $16.50 to 42,235 beneficiaries. Arkansas maintained one penitentiary and four reformatories at a total expense of $656,684 during the fiscal year ending June 30, 1951. There were approximately 1,520 adults and 247 juvenile inmates in penal institutions on Dec. 1, 1951.

Communications.—The state government spent $21,007,330 on roads and highways in fiscal year ending June 30, 1951. The state highway system comprised 9,716 mi. at the end of the calendar year 1951, and county highways (not in the state system) totalled about 53,722 mi. on the same date. About 853 mi. of roads in the state highway system were paved, surfaced or graded during the calendar year 1951 (unofficial estimate) and the state highway commission let contracts during the year for 610 mi. of surfacing and grading and 10,623 ft. of bridges. Main-track railway mileage was 4,269; airway mileage was 850. There were 85 airports and 2 seaplane bases in late 1951. Approximately 261,752 telephones were in use at this time.

Banking and Finance.—There were 177 state and 52 national banks on Dec. 31, 1951. Deposits in state banks on June 30, 1951, totalled $358,571,000; resources $390,770,000. Deposits in national banks on June 30, 1951, totalled $410,019,000; resources $444,099,000. The 8 state and the 35 federal saving and loan associations in Arkansas had combined resources of $72,000,857 on June 30, 1951. Real and personal property tax assessments listed by law at 20% of value totalled $682,373,956 during 1951. State treasury revenues during the fiscal year ending June 30, 1951, were $114,021,728.85; expenditures $137,591,269.11. The gross state debt on Dec. 31, 1951, was $127,218,500; the net debt was $120,236,000.

Agriculture.—The United States department of agriculture, University of Arkansas, estimated the value of principal crops harvested from 5,518,000 ac. (an increase in acreage of 1% from 1950) at $449,468,000 (preliminary), an increase in value of more than $20,000,000 over 1950. Crop production in 1951 was up 3% over 1950. Receipts from livestock and livestock products were $155,000,000.

Cotton ranked first, lint and seed having a value of $274,000,000, 61% of the total. Rice ranked second with a value of $45,000,000 (the second time on record that rice placed ahead of corn). Corn valued at $37,000,000 was third, followed by soybeans, $33,000,000. Arkansas' hay crop was worth $31,000,000 and truck crops, $12,000,000.

Manufacturing.—The value added by manufacturing in 1950 was $355,750,000; the number of establishments (including mining) totalled 3,428; the number of employees (average for 1950) was 81,643; and they received in salaries and wages a total of $183,304,000. There were 107 new industrial plants established during the year and 26 plants were expanded. (S. McM.)

Table II.—*Principal Industries of Arkansas*

Industry	Value added by manufacturing 1950*	1947	1939
Chemicals and allied products	$ 40,200,000	$ 29,194,000	$ 4,303,000
Food and kindred products	45,180,000	41,020,000	12,414,000
Lumber and products	129,137,000	92,800,000	29,596,000
Paper and allied products	31,393,000	21,887,000	4,443,000
Petroleum and coal products	23,124,000	17,064,000	3,894,000
Primary metal industries	24,909,000	18,885,000	747,000
Stone, clay and glass products	12,807,000	10,237,000	2,736,000
Other Industries	49,000,000	34,057,000	8,311,000
Total	$355,750,000	$265,144,000	$66,444,000

*Preliminary estimates only. The total figure of $355,750,000 was prorated to various types of industries on the basis of *The Blue Book of Southern Progress, 1950* breakdown of manufacturing business volume.

Table III.—*Mineral Production of Arkansas, 1949–1950*

(Short tons, except as noted)

Mineral	1949 Quantity	1949 Value	1950 Quantity	1950 Value
Barite	363,382	$2,907,056	343,168	$3,088,512
Bauxite	1,226,315	6,433,964	1,464,215	7,531,535

Stone	1,279,250	2,247,236	3,952,720	7,419,110
Other minerals	...	5,360,736	...	?
Total		$109,522,914		?

Mineral Production.—Table III shows the tonnage and value of mineral production in the state for those commodities whose value in 1949 exceeded $100,000, and the corresponding data for 1950, so far as they were available at the close of 1951. Arkansas ranks first among the states as a producer of bauxite.

Armies of the World.

The opening of 1951 saw the Communist offensive in Korea driving the United Nations forces south of the 38th parallel. This offensive was followed by a second period of comparative stalemate with only local attacks. The third phase, in September, saw a limited but powerful offensive by U.N. forces that succeeded in advancing north of the 38th parallel at all points and establishing a strong defensive position that could be held in the event the truce talks were successful. The September attacks exacted heavy losses from the Communist forces, although losses on the United Nations side were not light. The U.N. forces, however, succeeded in anchoring their western flank firmly on the Imjin river, used the barrier of the Kwachon reservoir to shorten the front, and controlled the key ranges on the eastern flank of the front. Control of the major part of the so-called "iron triangle" of North Korea gave the U.N. forces a strong defensive position.

During the year, the complexion of the Communist forces in Korea changed considerably, with North Korean forces assuming less and less importance. The Chinese Communist forces identified in Korea included large elements of the 4th field army, including the 12th, 13th, 14th, 15th, 16th, 17th, 21st, 51st, 53rd, 55th, 56th and 57th armies. (Chinese Communist armies generally consisted of three divisions, each of 6,000 to 8,000 men.) Communist losses were heavy, by the end of 1951 totalling around 1,500,000 of which 153,000 were held prisoner by U.N. forces.

Most significant development on the Communist side during 1951 was the increase in the size and efficiency of the air support. Russian-made jet fighters stubbornly opposed Operation

"REVIEWING HIS TROOPS," a cartoon by Manning of the McNaught Syndicate, Inc., published in 1951

"Strangle," the U.N. air effort to destroy the supply routes and bases of the Communist forces. As many as 200 Communist jet fighters were encountered by U.N. planes on a single day. In addition, reports indicated a considerable build-up of Communist air forces in Manchuria, with some estimates of as many as 1,000 planes in the area organized into ten Chinese air divisions of 100–150 planes each.

Although truce talks between the U.N. and Communist forces started in July and continued the rest of the year, there was evidence that the Communist forces continued to receive considerable equipment both from China and from the Soviet Union. General mobilization continued in China. The Communist forces were able to increase the rolling stock and showed considerable increase in automotive equipment, tanks, artillery and especially radar-controlled anti-aircraft artillery.

On the U.N. side, fresh troops were rotated into Korea to relieve those which had been in combat for some time. The United States 40th and 45th infantry divisions (originally the California and Oklahoma national guard divisions) were reported in Korea. Other developments in the U.N. forces included the organization of a British Commonwealth division which included brigades from the United Kingdom and Canada as well as other members of the commonwealth, particularly Australia and New Zealand. South Korea asked U.S. assistance in equipping ten new divisions, in addition to those reorganized and re-equipped after the initial disaster. Equipment was the major shortage in this respect, inasmuch as South Korea had 500,000 soldiers who had completed basic training as well as 2,200,000 men eligible for military service.

Indicative of the supply problem, the U.S. military sea transport service carried 11,000,000 measurement tons of dry cargo and 7,000,000 long tons of petroleum products to Korea up until the end of 1951. (*See* KOREAN WAR.)

North Atlantic Treaty Organization.—Sovereignty was the principal issue that plagued the NATO. None of its members disagreed with the philosophy that in unity there was strength, but in certain countries there was political dissent from yielding the prerogative of the nation to an international body, and in Belgium, at least, there was a constitutional obstacle. By the end of 1951, it was generally accepted that there should be a European army to hold the centre, with the British army holding the left and the United States army the right flank.

The problems in addition to sovereignty facing Gen. Dwight D. Eisenhower as SCAPE—supreme commander Allied powers Europe—could be summarized in their order of importance as economic, German, equipment and organization.

Economic problems were predominantly in the minds of the European powers. Each nation felt that it had reached the road to recovery, and was reluctant to grant any greater proportion of its budget to defense. Many looked to the United States for a greater share of the economic burden. France, particularly, was outspoken on the subject, indicating that it could not continue to fight in Indochina and contribute to European defense without U.S. assistance. Indicative of the increased emphasis on defense was the increase in defense appropriations as indicated below:

	1951	1952	% national income
	(In millions of dollars)		
United States	42,000	60,000	14.0
United Kingdom	2,450	3,885	9.6
France	2,235	2,260	9.3
Italy	650	800	5.0
Netherlands	280	400	7.0
Belgium-Luxembourg	250	300	5.3
Norway	66	100	5.0
Denmark	56	90	2.7

It should be noted that the above defense appropriations were for all armed forces, with the percentage for the ground forces varying from country to country. The aggregate expenditures of NATO thus were estimated in the neighbourhood of $66,000,000,000, which did not include approximately $3,000,000,000 from western Germany.

The German problem facing NATO, in its simplest terms, was the paradox of fearing rearmament of the reich, combined with recognition of the absolute necessity of German manpower to form a holding force in western Europe. The Germans joined with the French in backing a European army under which all ground forces would be pooled and placed under a single supreme

GEN. DWIGHT D. EISENHOWER (third left) shortly after his arrival in Paris in Jan. 1951 to assume command of military forces for the North Atlantic Treaty organization. Supreme headquarters for Allied powers in Europe (SHAPE) was not formally activated until April 2

commander with a common budget. Under this plan, each country would provide a certain number of divisional slices composed of 30,000 men, each slice to include a 12,000-man combat division plus 18,000 supporting troops. Each slice would be integrated into a corps which would be composed of other nationalities. This plan called for an army totalling 1,290,000 men composed of 43 divisional slices, of which France would supply 14, Germany 12, Italy 12 and the Benelux powers 5. Under this plan each power would retain within its national boundaries certain troops for service and pipe-line functions, and for international duties in such places as Korea, as well as internal security forces.

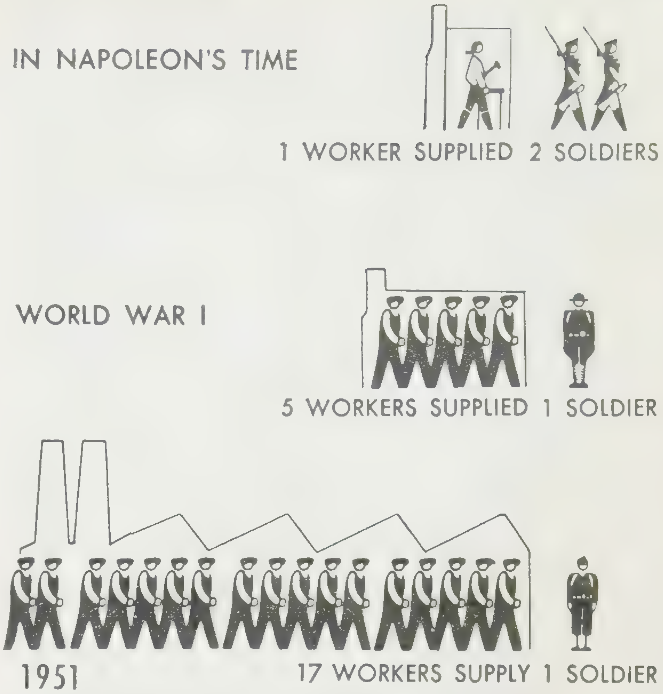
Equipment was the third major problem holding back European rearmament. Under a general agreement, the production of equipment was allocated among the various powers. It was generally agreed that the United States would produce heavy equipment, the Belgians small arms, the French light tanks, the Italians tanks and jeeps and the British medium tanks for the use of all the associated powers. However, the bulk of the equipment, at least 90%, was to be supplied by the United States. At the end of 1951 there were fewer than 20 divisions equipped for combat, largely as a result of the slowness in delivery of equipment. Tank production was only beginning, while the production of artillery, ammunition and vehicles was below requirements.

Organization of the NATO powers—the fourth problem of SCAPE—developed rapidly during the year. Eisenhower acquired some extremely competent deputies from the various powers. Italian Gen. Maurizio Lazzaro de Castiglioni was named commander of the ground forces for southern Europe under the command of U.S. Adm. Robert B. Carney; British Lieut. Gen. Sir Robert Mansergh was designated deputy commander of the northern command under British Adm. Sir Patrick Brind; and French Gen. Alphonse Juin was named commander of the central forces under Eisenhower.

Strategy.—Strategy of the NATO forces became clearer as the increase of forces in the field permitted the holding of large-scale manoeuvres. In Operation "Counterthrust" held in September, approximately 110,000 men participated in an exercise designed to throw back any attack across the north German plains. Participating in this operation were the British army of the Rhine, a regimental combat team from the French and U.S. armies and brigades from the Belgian, Danish, Dutch and Norwegian armies. In October the entire U.S. 7th army was put in action in Exercise "Combine" in which 160,000 troops participated in throwing back a hypothetical attack from the east. Other war games gave the NATO troops a chance to work with each other. The basic strategy that appeared to evolve centred around a possible thrust across the north German plains, in which the U.N. forces mounted flank attacks from Denmark and the North sea ports in the north and the Alpine region in the south. Emphasis was placed on a war of movement. The strategy envisaged 12 divisions east of the Rhine to hold; 25 divisions as the main blocking forces; and 100 divisions by D-day plus 90.

By the end of the year, the problem appeared closer to solution. The United Nations forces totalled almost 20 combat-ready divisions composed of 6 U.S., 4 British and 10 French, although admittedly some of the French divisions were short of equipment. In addition, about eight divisions were in varying degrees of combat readiness.

Training of the various NATO powers centred mostly around equipment. However, about 12,000 European officers and soldiers were trained in U.S. military schools. In addition, the North Atlantic Treaty Defense college was opened at the École Militaire in Paris at which 50 selected officers and civilians of the 12 treaty nations were to be trained each six months in the strategy, tactics, finance, economy and geography of the NATO powers.



IN NAPOLEON'S TIME
1 WORKER SUPPLIED 2 SOLDIERS
WORLD WAR I
5 WORKERS SUPPLIED 1 SOLDIER
1951
17 WORKERS SUPPLY 1 SOLDIER

WORKERS NEEDED to supply one fighting man in the U.S. army during Napoleon's time, during World War I and in 1951

One major problem facing the NATO powers was that of securing the right flank in the middle east. Greece and Turkey became, in effect, members of the defense community, and three methods were produced for incorporating the strengths of these powers into the organization. One method proposed a separate Balkan command, a second envisaged placing the powers under Admiral Carney in the Mediterranean command and the third saw the creation of a middle east command. One factor favouring the first method was the possible formal alignment of Yugoslavia with the U.N., which would advance the conditions favouring a Balkan command.

At the end of 1951, developments appeared to point toward a middle east command. In November Great Britain, France, Turkey and the United States communicated to the Arab powers and Israel the 11 principles on which they planned to establish a middle east command. It was clearly stated that the command would in no way interfere with disputes in the area, that all states would join on a basis of equality, that the command would not further the interests of any one state, that no power need place its forces under the command in peacetime and that no power would be forced to have foreign troops on its soil except by agreement. The plan undoubtedly contemplated blocking the solidification of any force around Egypt in its attempt to drive the British from the Suez Canal Zone. One objective was the elimination of defense deficiencies in the middle east; both Israel and the Arab states were offered the opportunity to acquire arms. The other principal attraction of the plan was the chance for economic development on the part of the indigenous powers. Nevertheless, Egypt rejected the plan in the heat of its Suez controversy with the British, while Lebanon, Iraq, Saudi Arabia, Syria and Israel were more receptive. At the end of the year there was no question but that the plan had created a major problem for the Arab league. (*See* also NORTH ATLANTIC TREATY ORGANIZATION.)

United States.—Army strength increased during 1951 from 1,100,000, and the equivalent in organized combat units of 18 divisions, to 1,600,000 and the equivalent of 24 divisions, composed of 18 divisions and 18 regiments. The budget for the army, which was $4,000,000,000 in 1950 and $19,500,000,000 in

1951, increased only slightly to $20,700,000,000 in 1952 (all fiscal years). Although there were serious deficiencies in equipment, particularly new medium and heavy tanks, specialized vehicles, rockets, guided missiles and radar, arms were flowing from the factories at the rate of $2,000,000,000 monthly at the end of the year. Deliveries of equipment to NATO powers were gradually building up, and 2,148 light and medium tanks had been delivered to France at the end of 1951. Over-all deliveries to all powers included 1,185 aircraft, 219 naval vessels, 6,907 tanks and combat vessels, 10,679 artillery pieces and 643,369 small arms and machine guns. (*See* also MUNITIONS OF WAR.)

Organization.—Although the role of tactical aircraft and control of ground-support missions continued to be a hotly debated subject between the army and the air force, no changes were made in controls. The air force announced the establishment of a pilotless bomber squadron to launch guided missiles in the direct support of ground troops. Ranger units were reduced in size and were to be assigned at the rate of one company per division.

Disposition.—By the end of 1951 the seven U.S. divisions in Korea were all up to strength and there were two divisions in reserve in Japan. The arrival of the 28th and 43rd infantry divisions in Germany completed the organization of the 7th army, which consisted of these units plus the 1st and 4th infantry divisions, the 2nd armoured division and the constabulary which was the equivalent of another armoured division. In the United States the 37th (Ohio national guard) and 44th (Illinois national guard) divisions were alerted for federal service early in 1952.

Training.—An air-ground support centre was established at Fort Bragg, N.C., to strengthen the field forces for combined exercises. A new training program was developed for national guard units. Several major training exercises were held, both in the United States and in Germany.

Exercise "Southern Pine" held during September was a controlled operation using the "aggressor force" as a training aid and stressing large-scale offensive and defensive night operations. Air-borne troops and tactical aviation played important roles as about 103,000 troops were used, including the 7th corps, 28th and 43rd infantry divisions, 82nd air-borne division, 511th regimental combat team of the 11th air-borne division, 2nd armoured cavalry regiment, 301st logistical command and elements of the 9th air force. While the exercise showed that the drop technique for heavy equipment was well-advanced, it proved the value of the C-122 assault transport for landing troops behind enemy lines.

Exercise "Combine" was the largest training operation yet held by U.S. troops in Germany. Using the characteristic attack from the east, the exercise indicated poor camouflage discipline, inadequate dispersal of troops and no security measures in rear area, but showed good speed in counterattacking and air-ground liaison.

Equipment.—The 57-, 75- and 105-mm. recoilless rifles proved themselves in battle and contributed to the doubling of the fire power of infantry divisions. New atomic weapons for tactical use in the field were tested. Canada, Great Britain and the United States agreed to standardize the use of 400 items, including the T-41 U.S. light tank and 8-in., 75-mm. and 240-mm. howitzers. But controversy continued over the adoption of a standard rifle, with the British .280, the U.S. .30 and the Belgian 7-mm. as the outstanding contenders. A new armoured personnel carrier was developed as well as an amphibious vehicle with great mobility over sand and tundra.

Development of tanks still lagged. The T-41 light tank was acknowledged one of the best in the world, with a 76-mm. gun, speed of 25 m.p.h. and weight of 25 tons, although it was too heavy for air-borne operations. Unreliable turret control hampered development of the T-47, which mounted a high-velocity 90-mm. gun and weighed 47–48 tons. No heavy tanks with 120-mm. guns were yet in operation.

Great Britain.—The position of the British in the European army caused some difficulty, as the decision was made not to integrate the British army of the Rhine into the continental forces. Defense expenditures increased to 24% of the budget and 8% to 10% of the national income. Tank production was doubled, including production of the 50-ton Centurion, which was supplied to the armoured divisions in Germany. The arrival of the 6th armoured division in Germany completed the army of the Rhine, which included, in addition, the 2nd infantry and the 7th and 11th armoured divisions. British troops participated with Norwegian, Dutch, Danish and Belgian brigades in joint manoeuvres. Egyptian attempts to get British forces from the Suez Canal area resulted in the reinforcement of that region at the end of the year with the 1st division from Libya and the 16th parachute brigade from Cyprus.

U.S.S.R.—There was no indication of any change of soviet strength during the year. The army strength continued at about 2,500,000 men organized into 175 divisions, of which about 65 were armoured or motorized. There were definite indications that soviet equipment was improving in quality, and tank strength was estimated at 30,000. Around 1,000,000 men were being drafted each year for a three-year period of military training, and trained manpower was estimated at 12,000,000 to 13,000,000.

Disposition.—Six soviet armies—the 1st, 2nd, 3rd, 4th and 7th guards armies and the 3rd shock army—were in Germany, all up to strength. Under the command of Gen. Vasili I. Chuikov, manoeuvres in 1951 tended to concentrate more on defense than previously. The last conscripts with battle experience, the class of 1927, returned to the U.S.S.R.

There were no indications of any major changes in soviet dispositions in Europe. There were reports of increased soviet forces in the far east.

France.—The continued fighting in Indochina was the major factor affecting the French army. Although France under Gen Jean de Lattre de Tassigny had made some progress in containing the Viêt-Minh forces, the attrition was considerable, with a total of 28,000 men and 1,014 officers listed as killed or missing. At the end of the year, there was apprehension of a major Viêt-Minh assault, perhaps with open intervention on the part of the Chinese Communists. During the year the Viêt-Minh progressed from guerrilla bands into well-equipped infantry organized into regimental combat teams and using such modern weapons as the 75-mm. recoilless rifle.

In metropolitan France conscription was lengthened from a year to 18 months, but the principal problem was equipment. Of the ten French divisions, two infantry and one armoured division in Germany were at combat strength, another armoured division was at 70% of strength and five infantry divisions and one armoured division in France were at from 20% to 70% of strength. The manpower, in trained reserves, awaited only the equipment to fill out the divisional strengths.

Training.—France revised the officer training system, abandoning the use of Coetquidan (which replaced war-damaged St. Cyr after World War II) as a single school for the training of officers in all branches. The modification adopted represented a change toward the pre-World War II system. Two academies at Coetquidan would provide two years of training for the élite of the officers' corps capable of advancing to higher ranks, and also would train in a one-year course noncommissioned officers and officer candidates from the ranks. Graduates would be sent to Saumur for motorized and cavalry training, Châlons for artillery, Angers for engineering and Fontainebleau for quartermaster specialization.

In addition to manoeuvres conducted in Germany with other NATO powers, France held special Alpine operations in August using the 27th Alpine infantry division. Experiments in these exercises included the use for the first time of mountain paratroopers in the "capture" of the mountain fortress of Briançon on the French-Italian frontier.

China.—*Nationalist.*—The U.S. military advisory group advocated a shake-up of the army, and a reduction of its size to take advantage of the available equipment. Of the 550,000 men, only about 300,000 were rated of good quality.

Communist.—Full mobilization continued in an effort to develop an army of 2,500,000. Five new military training schools were organized including artillery, tank and anti-aircraft artillery.

Other Powers.—*Arab Nations.*—Little increase in strength was shown during the year; total combined strength was two divisions. Jordan's legion, with the equivalent of an understrength division, and the Egyptian army, with one organized division, were the strongest forces. In addition, Egypt had a regiment of tanks composed of 16 British Centurions and a few U.S. Shermans.

Argentina.—A drastic army shake-up changed the command of three armies and eight divisions during the latter part of 1951.

Australia.—The forces in Korea were incorporated into the commonwealth division. The army was being equipped with British Centurion tanks.

Belgium.—The armament industry was developed as a major contributor to NATO equipment. Among the important items being produced were five-inch rockets, anti-tank grenades, nondetectable land mines, motor transport, Bofors anti-aircraft guns and radar equipment. The 7-mm. rifle was entered as a strong contender against the British .280 and U.S. .30 for standard usage. Its advocates stated that it was less complicated and cost 25% less. Like the others, this rifle could be used as a semiautomatic and fired as a submachine gun. In Korea the Belgian battalion changed its equipment from British to U.S., and adopted the U.S. 75-mm. recoilless rifle and U.S. company strength of 160 compared with the previous 120 to 130. Belgium extended the period of compulsory military service to 24 months and increased its defense budget to $250,000,000 or 17.1% of the total 1952 budget.

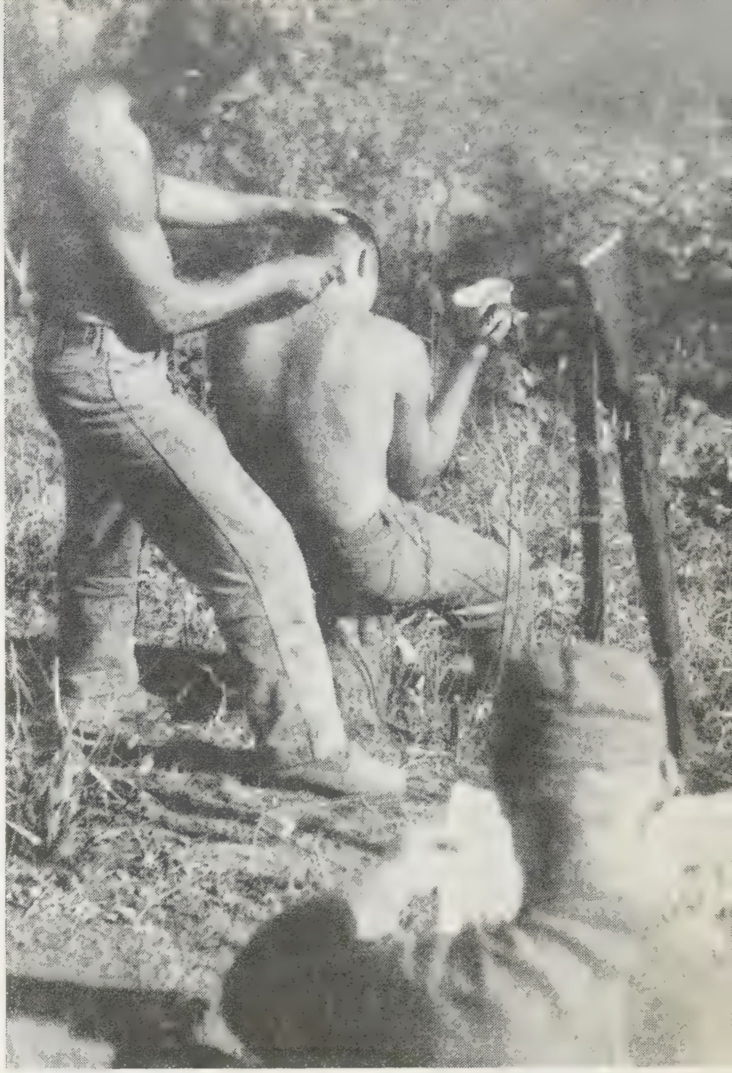
Brazil.—Talks were begun with the U.S. under the Mutual Security program.

Canada.—Canada announced a three-year defense plan that would cost a total of $5,000,000,000, and indicated that it planned to form another division toward an ultimate goal of 115,000 full-time personnel in its armed services. In addition to the brigade in Korea, the 27th brigade was sent to Hanover, Ger., as part of the 12,000 troops destined for Europe. Arms were supplied to one Dutch, one Belgian and one Italian division, and artillery to a Luxembourg artillery regiment.

Czechoslovakia.—The reconstructed armaments industry played an increasingly important role in the soviet program, with arms being sent to China. The army reached a strength of ten divisions, including four motorized and one armoured corps of three brigades, with an over-all strength of around 150,000 men.

Denmark.—The term of compulsory service was increased from 12 to 18 months to add 7,500 to 16,000 to the numbers called to active duty each year. One brigade continued to serve with the NATO forces as plans were made to form one complete division. Defense expenditures increased by 40%.

Germany—East.—The *Bereitschaften* was reorganized into 23 formations, each intended to be a 2,000-man cadre for a soviet-type infantry division of 11,000 men. It was reported that the top command was now under the Russians, and 150 senior officers were trained in the U.S.S.R. In addition, 5,000 officer candidates were trained in a nine-month course, with one in every seven specially trained as a political commissar.



MARINE CORPS photo captioned "tonsorial time out." It was taken during a lull in the fighting on the central Korean front in 1951, and the next customer, as in peacetime, leafed through an old magazine

Germany—West.—No rearmament was accomplished in 1951, as debate continued on the structure of the European army. Plans called for the organization of an army modelled on U.S. lines. Men 18 to 21 would be conscripted toward the development of an army composed of 12 divisional slices of 30,000 men each, with the U.S. or Great Britain supplying the heavy artillery and tanks. Another obstacle to the development of the army was German reluctance to bear the cost of its organization while paying the occupation costs of the U.S., British and French armies amounting to $1,400,000,000 a year. The probable composition of the German army would be three armoured divisions with around 300 tanks each, six motorized divisions with 70 tanks each, and three infantry divisions.

Hungary.—Reports varied on the actual strength of the Hungarian army. There was little question that the sovietization of this force reached a new high in 1951, perhaps including the cadring of Hungarian regiments into soviet divisions and elimination of purely Hungarian higher headquarters. Satellite manoeuvres were reported near Szolnok in September, including Russian, Rumanian, Bulgarian and Czechoslovak troops as well as Hungarian.

Israel.—The defense budget was more than tripled, and favourable reaction was indicated to the plan for a middle east pact, with a possible wartime contribution of 200,000 men.

Italy.—The most important development affecting the Italian army in 1951 was the lifting of the peace treaty limitations on the strength of the army as a result of notes from the major treaty signers. Biggest drawback to increasing the strength of the army beyond the previous 250,000 limit was equipment. The Italian units that appeared to be in greatest combat readiness were the Alpine brigades. Conscription was increased from 12 to 15 months.

Japan.—With the signing of a peace treaty, plans were made for the formation of an army. The natural cadre for this body was the Japanese national police reserve, composed of 75,000 men organized into two corps of two divisions each and armed with small arms, machine guns and mortars. Initial plans called for doubling this force.

Netherlands.—The conscription period was increased from 12 to 16 months.

Norway.—Conscripts were retained for additional defense courses, and reserve personnel were recalled. A budget of $350,000,000 for special defense measures through 1954 was passed.

Philippines.—Strength of the army was increased by 10 battalion-size combat teams, bringing strength to 24 battalions of 1,000 men each in addition to the constabulary of 7,500. Considerable progress was made toward cutting down the strength of the Hukbalahaps, whose armed strength was around 5,900.

Portugal.—A United States military mission was assigned to assist the development of the 30,000-man army, which was undertrained and underequipped. The goal was eight to ten divisions.

Rumania.—Compulsory military service for all specialized branches of the army was extended from two to three years.

Spain.—Outstanding development of the year affecting Spain was the agreement with the United States whereby use of bases was granted in exchange for assistance. The United States was granted the use of Cádiz, Cartagena, Ferrol, Santa Cruz, Barcelona, Madrid and Seville. U.S. inspection of the Spanish army immediately revealed only about 250,000 men in the army formed into 22 paper divisions, although the largest manoeuvres that could be held were in less than regimental strength. Small arms were plentiful, but all other equipment was an assortment left from the Spanish Civil War and was a combination of German, Italian, French and Russian. However, a good potential was revealed, with wartime mobilization of 2,000,000 and a natural ability at guerrilla warfare. Immediate steps were taken to train Spanish officers and noncommissioned officers in the United States, to increase the number of officers by increasing the program at universities, to provide artillery, radar and antitank weapons and to make essential economic improvements such as those in highways, railways and ports.

Sweden.—The commander in chief of the armed forces asked for a change in the draft law to permit calling up 70,000 men for a refresher course of six months.

Switzerland.—Steps were taken to increase the armoured force by 550 medium tanks. The annual budget of $115,000,000 for the army was to be augmented by $250,000,000 for extra equipment during the period 1951–55.

Yugoslavia.—Military aid commenced to arrive from the United States, and the U.S. chief of staff inspected the army. A U.S. military mission arrived to assist in training in use of the equipment. (*See* also ATOMIC ENERGY; AVIATION, MILITARY; NAVIES OF THE WORLD.) (L. B. K.)

Art Exhibitions.

A revival of interest in German Expressionism came about with the large showing of paintings by Lovis Corinth (1858–1925) at the Boston (Mass.) Institute of Contemporary Art. This museum also organized an interesting exhibition of the work of the 82-year-old Irish painter, Jack B. Yeats, brother of the noted poet and playwright, William Butler Yeats.

"Italy at Work," a comprehensive exhibition of crafts and industrial design produced since World War II, opened at the Brooklyn museum (Brooklyn, N.Y.), was then featured at the Art Institute of Chicago and went on circuit to ten other museums. Ceramics, glass, fabrics, metal work, furniture and toys made up a fascinating showing. An added feature was a group of four interiors, including the lobby to a puppet theatre and a small chapel.

As a joint endeavour the Detroit (Mich.) Institute of Arts and the Toledo (O.) Museum of Art showed "Travelers in Arcadia—American Artists in Italy 1830–1875." In the days before Paris and Munich became noted centres for art students, Rome and Florence were the main attractions. U.S. artists who could do so went there at least for brief study and often for several years' residence. These included such painters as Thomas Cole, Asher Brown Durand, G. P. A. Healy, John Frederick Kensett, Frederick Stuart Church, Washington Allston and William Page. Notable U.S. sculptors in Italy were Horatio Greenough, Hiram Powers, Randolph Rogers and Harriet Hosmer, the young woman who is presumably portrayed in Nathaniel Hawthorne's *The Marble Faun.*

With 100 works from 85 artists, the Museum of Modern Art (New York city) showed "Abstract Painting and Sculpture in America," covering the period from 1913 when the famous Armory Show gave the U.S. its first view of advanced art trends from abroad.

The Cleveland Museum of Art and the Museum of Modern Art combined on a full-length retrospective exhibition of paintings and some sculpture by the Italian-born Amédéo Modigliani (1884–1920) who settled in Paris and became a leader among the young moderns.

Yale university's Gallery of Fine Arts and the Baltimore (Md.) Museum of Art joined forces to do "Pictures for a Picture" of Gertrude Stein as a collector and as a writer on art and artists. This stimulating exhibition was largely drawn from Yale's rich collection of Stein manuscripts and from the noted Cone collection recently left to the Baltimore museum. Added to this was Pablo Picasso's famous portrait of Gertrude Stein lent by the Metropolitan Museum of Art (New York city).

A comprehensive memorial exhibition of paintings by C. S. Price was arranged by the Portland (Ore.) Museum of Art. Price, born in Iowa in 1874, was a cowboy in Wyoming and ultimately became a painter. Largely self-taught, he was a semi-abstract, visionary painter who evolved his amazingly advanced viewpoint from inner compulsions rather than from any contact with *avant garde* artists.

The 126th annual exhibition of the National Academy of Design was more lively than usual because of the inclusion of several younger artists outside the academy's ranks. Robert Philipp won the $1,000 Altman prize for figure with "Ladies of the Evening." The $1,000 Altman prize for landscape went to Francis Speight for "The Lockhouse." For the fourth consecutive season the University of Illinois at Urbana assembled a lively contemporary American painting exhibition. Three art department members acted as a committee to select 130 pictures and expended $7,500 as a purchase fund.

The art of the northwest coast Indian was featured at the Brooklyn museum where house posts, totem poles and many other wooden objects and weavings showed the highly developed culture of the tribes inhabiting the narrow 1,000-mi. coast area stretching from the Columbia river to Alaska. A similar exhibition was a summer event at the Colorado Springs Fine Arts centre where the noted designer, Herbert Bayer, did a special installation.

Carnegie institute's department of fine arts in Pittsburgh, Pa., showed eight centuries of French painting, 1100–1900, with 172 paintings, illuminations and drawings. Top quality material was borrowed from collections all over the country and was climaxed by Jean-Baptiste Siméon Chardin's "Saying Grace," lent by the Louvre in Paris.

New York city's Whitney Museum of American Art staged a lively, all-invited annual with 150 painters represented of whom 64 were newcomers.

The Art Institute of Chicago also featured an all-invited exhibition in its 60th annual of painting and sculpture. Prizes were awarded by a jury of three: Aline B. Louchheim, *New York Times* associate art editor, and artists Peter Blume and Hans Hofmann. The $2,000 Logan prize went to Willem de Kooning for "Excavation," the $1,000 Logan prize to Theodore J. Roszak for "Sea Quarry" (later purchased for the Norton gallery at West Palm Beach, Fla.) and the $1,000 Walter Campana Purchase prize was awarded to Herbert Katzman for "View of Prague."

A four-way combination of the art museums of Indianapolis, Ind., Dayton, O., Columbus, O., and Davenport, Ia., showed "Art in Colonial Mexico," 16th, 17th and 18th century painting, sculpture and decorative art objects. Lent from a few collections in the U.S. but for the most part from museums south of the border, this exhibition was witness to the increasing interest in Mexican culture.

The Brooklyn museum celebrated the publication of *Revolution and Tradition in Modern American Art* by their painting curator, John I. H. Baur, with an exhibition of 150 paintings showing the development of various trends in the U.S. since 1900.

One of the outstanding events of the season was the large retrospective exhibition at the Museum of Modern Art of the work of Henri Matisse, leader of the modern movement in France who was still active at the age of 82. The finest of his works were borrowed from the French government and from museums and private collections in the U.S., liberally supplemented by loans from abroad including many items from the artist himself. The exhibition was scheduled in 1952 for Cleveland, Chicago and San Francisco.

The Worcester Art museum organized an unusual exhibition of paintings based primarily on the question of having each item in a fine state of preservation. Called "Condition Excellent," the showing included a variety of works dating from as early as 1350 and as late as 1800.

The Metropolitan Museum of Art turned over its special exhibition galleries to celebrate the 75th anniversary of the Art Students league and gathered works by notable teachers as well as by some famous graduates. Thomas Eakins, Frank Duveneck, John La Farge, William Merritt Chase, George Wesley Bellows and Charles Dana Gibson were among the best known. Following its new plan for a series of outstanding contemporary American exhibitions, the Metropolitan put on an all-sculpture show, 200 items selected by jury on the basis of photographs submitted by artists from all over the country. (F. A. Sw.)

Great Britain and Europe.—The outstanding exhibition of the year was undoubtedly that of Michelangelo Amerighi da Caravaggio and his followers at Milan, It. This exhibition displayed the greater part of the master's known work, calling attention in particular to those noble last works which for centuries had been virtually incarcerated in the impenetrable gloom of Sicilian churches.

A Burgundian exhibition, first assembled at Dijon, Fr., and later shown in Amsterdam, Neth., and Brussels, Belg., included notable works by John van Eyck and Rogier van der Weyden, while the Museum of Arras (Fr.) staged an exhibition of mediaeval art in Artois. An exhibition of "Costume in Five Centuries of Painting," held at the Palazzo Madama, Turin, It., included works by Parmigiano, Lucas Cranach the elder, Peter Paul Rubens, Renoir and many others.

A remarkable collection of French Impressionist pictures from German collections was shown at the Orangerie in Paris, as was the comprehensive exhibition of Toulouse-Lautrec, which included a number of important loans from the U.S. Three outstanding shows of modern sculpture also took place in Paris: a retrospective of Pablo Picasso's work in sculpture at the Maison de la Pensée Française; a retrospective of Henri Laurens at the Musée d'Art Moderne; and the long-awaited exhibition of new works by Alberto Giacometti.

In Great Britain, 1951 being Festival year, English art tended to monopolize the countless loan exhibitions arranged by official bodies. The main section of the Royal academy's winter exhibition of 1950–51, entitled "Works by Holbein and Other Masters of the 16th and 17th Centuries," was devoted to Tudor portraits. Stuart art was represented by the examples of the Mortlake period which dominated an important exhibition of English tapestries held in Birmingham, and by the first exhibition of William Dobson, painter to the court of Charles I at Oxford, which was shown initially at Worcester and then transferred to the Tate gallery, London. The golden age of English portraiture was represented by Gainsborough at Bath, by Reynolds at Plymouth, by John Opie at Truro, by Lawrence in Bristol, Brighton and London (at Agnew's), and at the Tate gallery by a selection of Eton leaving-portraits. In Hampstead there was shown a well-chosen selection of "Constable and His Contemporaries."

Of the moderns, W. R. Sickert was seen to advantage in London at Roland, Browse and Delbanco's and at the South library, Islington, while at Southampton he figured in an important exhibition of the Camden Town group. Memorial exhibitions to Edward Wadsworth, Randolph Schwabe and A. S. Hartrick were held in London. There was a large-scale retrospective show of Henry Moore at the Tate gallery, and a smaller one of Graham Sutherland at the Institute of Contemporary Arts.

The Arts council's "Three Centuries of British Watercolours and Drawings" was an avowedly personal anthology compiled by Brinsley Ford. "Ten Decades: a Review of British Taste, 1851–1951," organized by the Institute of Contemporary Arts, was the most instructive and the most entertaining exhibition of English art held in Britain in 1951. The most distinguished artistically was the Royal academy's "First 100 Years of the Royal Academy, 1769–1868," in which all the leading English artists within the period were represented, with the exception of Romney, Rossetti and Whistler.

Three important exhibitions of non-European art were held in London during the year: the Rothenstein collection of Indian paintings at the Victoria and Albert museum, T'ang art at the British museum and, at the Imperial institute, "Traditional Art from the Colonies," including some newly excavated terra cottas from Nigeria. Art Sales.

The Parke-Bernet galleries of New York city announced a 1951 season of $5,547,525. Prices on

top quality objects were on the increase while prices on more average merchandise remained about the same. All types of silver and jewellery were bringing higher prices. The highest prices paid for paintings were $13,000 for a François Boucher "Pastorale," $12,500 for Antoine Watteau's "Fête au Dieu Pan," $11,000 for Jean Nattier's "Marquis de Ligueris" and $10,000 for Walter Pater's "L'Escarpolette." The top price for a print was $1,600 for Henri de Toulouse-Lautrec's "Partie de Compagne."

A Philadelphia mahogany chair brought $6,500 in the Norvin H. Green sale, a Persian silk rug, about 1640, brought $11,500 and a marble bust by J. A. Houdon of the marquise de Sorcy-Thelusson sold for $8,000.

The Plaza auction galleries had an all-time high season of $1,925,876. Their top prices were $4,000 paid for George Romney's "Portrait of Mrs. Molony," $2,400 for a Tenier's Brussels tapestry and $1,350 for Frederic Remington's bronze "The Rattlesnake."

Kende galleries had a season totalling $923,861. The most important collections sold were those of Walter P. Chrysler, Jr., and Prince Kazuo Kawaguchi, brother of the emperor of Japan.

London as usual was the centre of numerous important auctions, often necessitated in order that families might pay the high death duties. Christie's sold the contents of Woburn abbey belonging to the duke of Bedford for £27,340. Of this, £2,625 was paid for Jacob van Ruisdael's "Wooded Landscape," £2,520 for Isaac van Ostade's "Two Horsemen Halting at an Inn" and £1,680 for a Bartolome Murillo "Madonna." Maj. Gen. Sir Allan Adair sold three panels by the early Italian master Taddeo di Bartolo for £2,835. A collection of 12 drawings and 46 small oils on paper, all by John Constable, brought £9,355 for Sir Frank Newson-Smith, former lord mayor of London.

High prices were paid for fine porcelain; for instance, £945 for a pair of Chelsea figures (Hugo Pitman sale, Christie's) and £2,050 for a Chelsea "Lady of the Italian Comedy" and £2,000 for a pair of Bow parrots (sales at Sotheby's).

The earl of Harewood sale at Christie's totalled £55,043, highlights of which were a Louis XVI upright *secrétaire,* £3,150; a jardiniere with Sèvres porcelain plaques, £2,310; and a console mahogany table, £2,310. Baroness Burton sold three Gainsborough portraits for £9,975 and Edward Hulton sold Sir Joshua Reynolds' "Portrait of General the Hon. Edward Bligh" for £2,625.

In silver, the major items were £620 for a silver-gilt steeple cup of 1626 (Mrs. Henrietta C. Tarleton), and £480 for a silver-gilt *tazza,* 1662 (L. Garfit Wilson), both at Christie's. Sotheby's sold a lion sejant spoon, dated 1525, for £550 and an Irish ewer by Thomas Boulton for £550. Great interest was taken in the Gwen, Lady Melchett sale at Sotheby's where a Leonardo da Vinci drawing of the Virgin sold for £8,000. This was acquired by the Metropolitan Museum of Art in New York city. A Rembrandt pen and ink sketch, "Isaac Blessing Jacob," brought £1,550 and Francesco Guardi's "Pope Pius VI Receiving the Doge and Senators," £4,400. A Rembrandt painting, "Christ at the Column," dating from 1628 ("property of a gentleman"), sold for £8,200.

The Walter Hutchinson collection brought £124,896 at Christie's, Constable's "The Young Waltonians" selling for £44,100, the highest auction price for a Constable. (F. A. Sw.)

Astronomy.

One of the most remarkable discoveries in many years was the observation in interstellar space of the hydrogen emission at a wave length of 21 cm. It was first observed in March 1951 by H. I. Ewen of Harvard university; a few weeks later it was also observed by C. A. Muller at Kootwijk, Neth. The presence of the emission line had been predicted by H. C. van de Hulst of Leyden, Neth., seven years earlier. The most intense radiation is observed in the direction of the centre of our galaxy. In certain directions the line is broadened by galactic rotation. As a result of the discovery, the rotation of the parts of the galaxy near the nucleus would now be measurable, and the shape of the line would give new information of a fundamental nature about our stellar system.

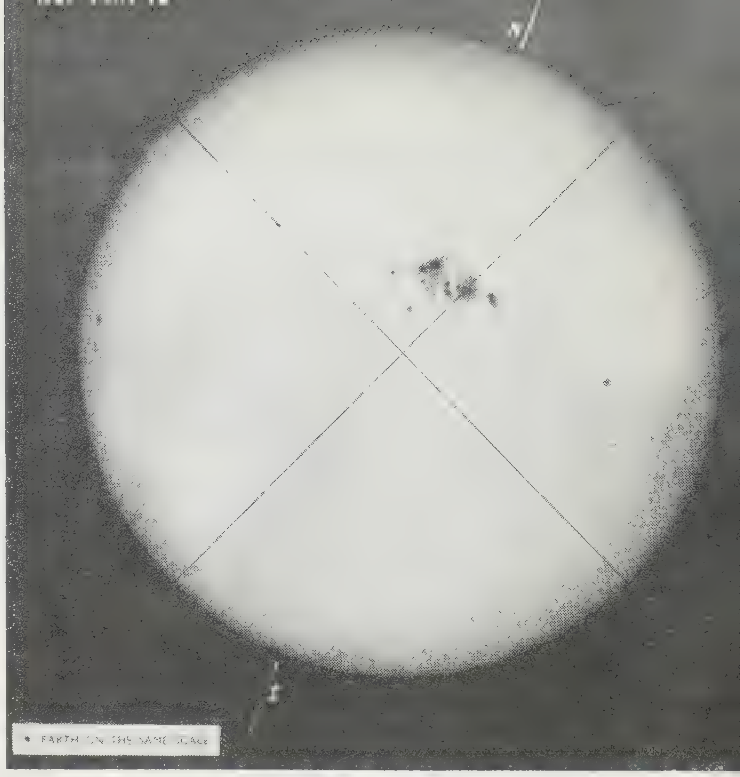
Solar System.—A connection between cosmic-ray intensity and disturbances on the surface of the sun was found by J. A. Simpson, Jr., of the University of Chicago. The intensity of fast neutrons was used as an indicator of changes in the intensity of the primary particles which arrive at the top of the earth's atmosphere. Certain solar flares which were accompanied by magnetic storms on the earth were also accompanied by a marked increase in the intensity of the fast neutrons. Two possible explanations were suggested by the investigator: (1) the low-energy primary particles are normal parts of the cosmic radiation, and are permitted to reach the earth through a temporary decrease in the magnetic field of the earth or sun; or (2) the low-energy particles are produced in the solar system during the period of solar eruptions (flares). The evidence was more favourable toward the latter explanation.

Unusual interest was shown in the solar eclipse which was to take place on Feb. 25, 1952. The path of totality would extend from the mid-Atlantic ocean near the equator across central Africa, the Anglo-Egyptian Sudan, Arabia and Iran, and end in Siberia. The most favoured site for observation was near Khartoum on the Nile; the chances for successful observation at this almost cloudless location were very good. In addition to the classical types of research, observations were to be made with radio telescopes.

A new satellite of Jupiter—its 12th—was discovered by S. B. Nicholson of Mount Wilson observatory, California.

The Stars and Nebulae.—Measures with the great 200-in. Palomar telescope (California) of distant galaxies by M. L. Humason gave motions in the line of sight greater than any previously known. The largest velocity measured, 60,900 km. per second, was about one-fifth the velocity of light. This velocity was observed for a galaxy in a cluster whose distance from the sun is of the order of 350,000,000 light-years.

Several important papers on galactic structure were published during the year by workers at Lick and Mount Wilson observatories. The rotation of galaxies was investigated by N. U. Mayall of the Lick observatory of the University of California. Extending the work of H. W. Babcock, he was able to make a fairly detailed comparison of rotational motions in our galaxy with those of the Andromeda nebula. The main body of the latter rotates like a solid. Emission nebulosities which lie at greater distances from the nucleus, however, show a definitely lower velocity of rotation; that is, in the outer, fainter parts the velocities of rotation tend toward those in a planetary system, where most of the mass lies in the inner regions. Now a direct comparison could be made with our galaxy. It was known that outside the region where the sun is located the stars revolve more slowly than the sun. Mayall thus concluded that somewhere in the galaxy, inside the sun's orbit, the rotational velocity reaches a maximum. He attempted to find this place by studying the velocities of cepheid variables and concluded that the sun is probably located slightly outside the main body of our galaxy.



GIANT SUNSPOT photographed in 1951 at the Royal observatory, Greenwich, Eng., the third largest on their records (compare the earth drawn on the same scale at bottom left for relative sizes). Sunspots cause occasional disturbances in long-distance radio communication

W. Baade of the Mount Wilson-Palomar observatories studied the galaxies from the point of view of composition. The fundamental quality which allows them to be divided into two groups is the presence or absence of dust clouds. When dust is present there are also blue giant stars; when it is absent the blue giants are also absent; the distinctive feature of dust-free systems is the presence of large numbers of red giants. Galaxies which have no dust are quite transparent; other more distant galaxies can be observed shining through them. Galaxies which have dust clouds (like the Andromeda nebula) show structure of a distinctive type; the dust clouds and blue giants are closely associated and are arranged in spiral arms; in between the spiral arms, and especially brilliant in the central region, are swarms of red giants. A comparison of this picture with our galaxy led Baade to the conclusion that the latter is a spiral of a type closely resembling the Andromeda nebula; the large-scale details of our own system are, however, far more difficult to investigate. (*See* also National Geographic Society.)

Atomic Energy.

Development by the United States of a tactical atomic bomb, a lightweight, compact weapon suitable for battlefield use against ground troops, was the most important event in the field of atomic energy during 1951. Many military authorities felt that it marked the beginning of a revolution in the art of warfare and that it would provide the United States and western Europe with the means of parrying the threat of superior manpower posed by the U.S.S.R. and Communist China.

The year saw a marked intensification of the atomic armament race. More nuclear explosions occurred in 1951 than in all the previous years since the discovery of atomic fission.

The United States, by unofficial count, set off 16 atomic explosions, while the U.S.S.R. was reported to have staged 2. Explosions in previous years included 8 set off by the U.S. and 1 by the U.S.S.R. Thus the grand total of all known nuclear detonations at the close of 1951 was 27.

No progress was made toward an agreement for the international control of atomic energy during 1951. The gulf separating the soviet bloc from the rest of the United Nations on this question remained as wide as ever.

On Dec. 29, 1951, the U.S. Atomic Energy commission announced the first production of useful electric power from atomic energy. Heat removed by a heat exchanger from a breeder nuclear reactor at the National Reactor Testing station at Arco, Ida., was employed to generate enough steam to drive a turbine generator.

Other events of importance in the realm of atomic energy during 1951 included the construction of a nuclear reactor as a joint project by the Netherlands and Norway; perfection by Canada of a "cobalt bomb," not a weapon, but a device for the treatment of cancer with radioactive cobalt; and the installation by the British of a heating plant employing atomic energy in an 80-room building at the Harwell atomic energy establishment.

U.S. Detonations in 1951.—The United States staged four series of atomic test explosions in 1951. Only a minimum of information concerning them was made public by the U.S. Atomic Energy commission.

The first series took place at Frenchman's Flat, a portion of the air force bombing and gunnery range located on a 5,000-sq.mi. tract about 75 mi. from Las Vegas, Nev. Five atomic explosions were set off on Jan. 27 and 28, Feb. 1, 2 and 6, each at 5:46 A.M., P.S.T.

The first explosion caused considerable excitement in Las Vegas where hundreds of persons saw the flash of the explosion. A greater number heard its thunderous roar, felt its vibrations and experienced the air blast which ran through the streets of the city in an irregular pattern.

The second explosion impressed Las Vegas observers as three times as powerful as the first. The dazzling flash of light and the thunderous noise were observed 200 mi. away in Arizona, southwestern Utah and southeastern California.

The third and fourth explosions were smaller but the fifth was the mightiest of all. The flash was seen 250 mi. S. of the Mexican border, a distance of 500 mi. from Las Vegas.

The Atomic Energy commission described the five blasts as "limited-scale weapons tests." It was believed that they were preliminary tests of tactical atomic bombs.

The Tests at Eniwetok.—The second series of tests in 1951 was held at the Eniwetok proving grounds in the Marshall Islands in mid-Pacific in April and May. The Atomic Energy commission described this as a "full-scale test program." It was believed that a total of four bombs were set off. Apparently they were several times more powerful than the bombs exploded over Hiroshima and Nagasaki.

A brief statement issued jointly by the Atomic Energy commission and the department of defense stated, "In furtherance of the President's announcement of Jan. 30, 1950, the test program included experiments contributing to thermonuclear weapons research." This aroused speculation as to whether an atomic bomb had been exploded in conjunction with hydrogen isotopes to test the ability of an atomic bomb to "trigger" the thermonuclear reaction required for a hydrogen bomb.

The tenth semiannual report of the Atomic Energy commission disclosed that experiments were carried out in the Eniwetok tests to determine the effects of atomic radiations, burns and blasts on living things and to obtain data as to the effects of atomic weapon explosions on structures, aircraft and various materials. Anaesthetized mice, dogs and swine were exposed to the explosions.

The report revealed that the Eniwetok tests demonstrated that lingering radioactivity after an air burst need not delay rescue and recovery work. After explosions, many scientists and technicians returned to the test sites promptly by helicopters and speedboats for sufficient periods to recover instruments and specimens.

Operation "Greenhouse," as the Eniwetok tests were officially called, was carried out by joint task force 3 under the command of Lieut. Gen. Elwood R. Quesada. Alvin C. Graves of the Los Alamos laboratory was deputy scientific commander.

Tactical Atomic Weapons.—The third series of 1951 tests took place at Yucca Flat, to the east of Frenchman's Flat in Nevada, in October and the first week of November. Five explosions were set off. It was believed that they were the final tests of revolutionary new tactical atomic weapons originally tried out in the first series of explosions of the year.

The first atomic explosion at Yucca Flat on Oct. 22 was the tiniest nuclear explosion on record. Smaller than a test T.N.T. blast, it was assumed to have been a "fizzle" until commission officials stated that this was not the case.

The second explosion was that of a bomb dropped from an aeroplane on Oct. 28. It exploded several thousand feet above the ground with the formation of an orange-red fireball followed by the familiar pillar of smoke topped with a "mushroom" cloud. Observers believed that this was a test of what air force spokesmen had previously described as a small-scale "air-to-ground" atomic bomb for use against ground troops.

The third explosion on Oct. 30 was also that of a bomb dropped from an aeroplane. It exploded at about 1,000 ft. with a dazzling flash and the formation of a fireball. The blast was seen 270 mi. away and observers agreed that it was several times bigger and brighter than the previous explosion. The general opinion was that this was a compact, tactical bomb with the explosive violence of the strategic bomb set off at Bikini.

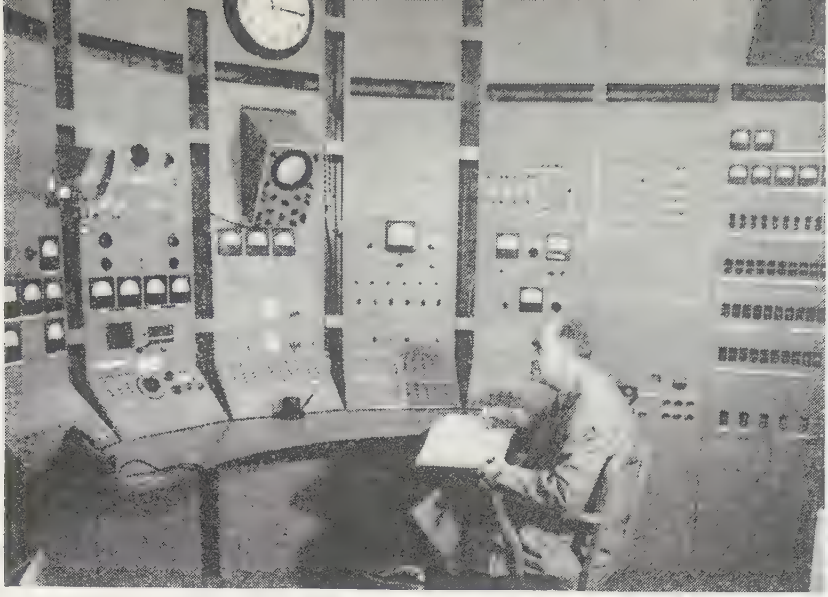
The fourth explosion on Nov. 1 was smaller while the fifth, on Nov. 5, was the most powerful of all.

The 1951 tests came to an end with a fourth series of tests consisting of two nuclear explosions at Frenchman's Flat on Nov. 19 and 29. The final blast was believed to have been an underground detonation, the first of its kind ever attempted.

Exercise "Desert Rock."—The first simulated atomic warfare manoeuvre in history was held at Yucca Flat in Nevada on Nov. 1 in conjunction with the explosion of the fourth bomb in the third series of 1951 tests. Known officially as Exercise "Desert Rock," it was under the direction of Maj. Gen. William B. Kean, veteran commander of the 25th infantry division in Korea.

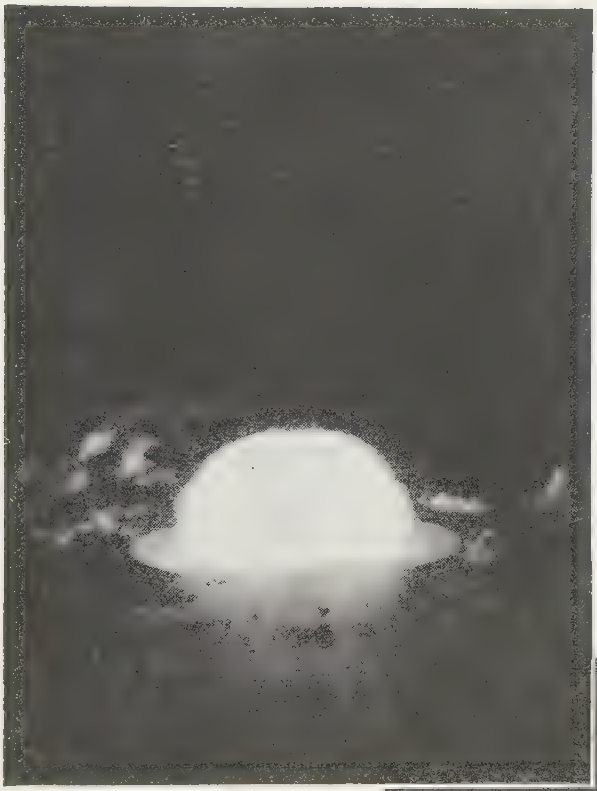
About 5,000 men and officers of the army, navy and air force took part in the manoeuvre or were present as observers. The chief participant was a reinforced battalion combat team of about 1,000 men.

This team set up simulated battlefield positions of a normal type with foxholes, barbed wire entanglements, etc., and then withdrew, leaving behind, however, equipment, scientific measuring instruments and a number of anaesthetized sheep, dogs



Left: ENRICO FERMI at the control panel of the University of Chicago synchrocyclotron, the largest atom smasher in the world at the time of its dedication in May 1951

Below: BELGIAN AND BRITISH physicists at the international atomic research station situated at 11,700 ft. in the Swiss Alps, where problems of cosmic radiation are investigated. The site was chosen because cosmic radiation increases with altitude



Left: NUCLEAR DETONATION during the 1951 series of U.S. tests at Eniwetok atoll in the Pacific. Purpose of Operation "Greenhouse" was partly the testing of materials and designs for bomb shelters and other buildings

Below: LOS ANGELES photographed by light from an atomic flash at 5:47 A.M. on Feb. 2, 1951. The test explosion took place about 300 mi. away in the Nevada desert

and rats. The entire armed force contingent, as well as about 2,000 other observers, including congressmen, government officials and scientists, took up their stations at various posts from six to ten miles from the "battlefield."

The bomb was dropped from an aeroplane at 7:30 A.M., P.S.T., and exploded at an estimated altitude of 1,000 ft. There were the usual bright flash, the orange-red fireball and the rising pillar of smoke.

After the explosions, the combat team returned to its "battlefield" positions to examine the damage that had been done to exposed equipment and the anaesthetized animals.

Soviet Atomic Explosions.—The first soviet nuclear detonation in 1951 was disclosed on Oct. 3 in a statement from the White House which said in part, "Another atomic bomb has recently been exploded within the Soviet Union. In spite of Soviet pretentions that their atomic energy program is being directed exclusively toward peaceful purposes, this event confirms again that the Soviet Union is continuing to make atomic weapons."

On Oct. 6 Joseph Stalin, in an interview published in *Pravda,* confirmed that an atomic bomb had been exploded, adding that he regarded atomic weapons necessary to the defense of the U.S.S.R., and that the development of such weapons would continue until international controls were established. He disclosed that atomic bombs of "various calibres" would be tested in the future.

On Oct. 22 the White House announced that "another atomic explosion" had taken place in the U.S.S.R. This was the second soviet nuclear explosion in 1951 and the third in history.

U.S. *v.* U.S.S.R.—It was difficult to evaluate the atomic strength of the United States *v.* the U.S.S.R. during 1951 since neither had disclosed the essential information for such a comparison. It was generally assumed that the U.S. had a stock pile of strategic atomic bombs in the neighbourhood of 1,000, while the U.S.S.R. was believed to have less than 50.

The best U.S. bomb was more than two and one-half times as powerful as the Nagasaki bomb, perhaps as much as six times as powerful. While the United States had not yet achieved a hydrogen bomb, it was assumed that the Atomic Energy commission was convinced that one could be built.

Some authorities were inclined to interpret Stalin's remark about bombs of "various calibres" to mean that the U.S.S.R. was also working on tactical atomic weapons.

Expansion of U.S. Facilities.—The expanded program in the field of atomic energy embarked upon by the United States in 1950 following the announcement of the first soviet atomic explosion was enlarged even more in 1951. Congress appropriated more than $2,000,000,000 for the activities of the U.S. Atomic Energy commission in the fiscal year 1951. Nearly three-fourths of this was spent on construction and equipment.

The Atomic Energy commission increased its supplies of raw material and its output of fissionable material during the year. Deliveries of uranium concentrates from the Belgian Congo and from Canada continued at scheduled rates. Domestic production increased to the point that the United States became second among the free nations in the mining and processing of uranium ores. Construction was begun in 1951 on plants in the Union of South Africa to extract uranium from gold ore residues.

The commission expanded its exploration program during 1951 to locate ore reserves in the United States.

Progress was made during 1951 on two new major production plants. One was the Paducah, Ky., plant for the separation of uranium 235 from ordinary uranium by the gaseous diffusion process. The other was the Savannah River plant, near Augusta, Ga., which would be capable of producing either fissionable materials or hydrogen isotopes.

Atomic Submarine.—On Aug. 21, 1951, the U.S. navy's bureau of ships announced that a contract for the first atomic-powered submarine had been given to the Electric Boat Co. of Groton, Conn. Subsequently a contract for the driving mechanisms for the submarine was awarded to the Westinghouse Electric Corp. It was believed that this company would also be commissioned to build the nuclear power plant for the submarine although both Westinghouse and the General Electric Co. had been working on the design of nuclear reactors suitable for power plants in submarines.

Atomic Aeroplane.—The U.S. air force announced on Sept. 5, 1951, that it had awarded a contract for the development of an atomic-powered aeroplane to the Consolidated Vultee Aircraft Corp. of San Diego, Calif. The General Electric Co., it was announced, was working on the design of a nuclear power plant for such a plane.

The problem was to design a plane capable of carrying aloft the considerable weight of a nuclear reactor with its necessary shielding to protect the crew from its radioactivity.

New U.S. Program.—Speaking from the floor of the senate on Sept. 18, 1951, Sen. Brien McMahon, chairman of the congressional joint committee on atomic energy, proposed a vast expansion of the nation's atomic energy program, increasing expenditures to $6,000,000,000 a year. He insisted that with mass production methods it would be possible to manufacture an atomic bomb for the current cost of a tank. He called for the creation of "an atomic army and an atomic navy and an atomic air force."

Speaking in Los Angeles on Oct. 5, Gordon Dean, chairman of the Atomic Energy commission, stated positively for the first time that the United States possessed tactical atomic weapons and that the time had arrived for considering their use on the battlefield. He stated that the weapons called for a revolutionary change in concepts of warfare and that their use against troops in the field, unlike the strategic bombing of cities, involved no greater moral considerations than the use of conventional battlefield weapons.

The congressional joint committee on atomic energy unanimously adopted a resolution on Oct. 17 calling on the department of defense and the Atomic Energy commission to prepare by Jan. 3, 1952, a detailed program for the maximum expansion of the role of atomic energy in national defense.

Experimental Breeder Reactor.—A report issued on Oct. 19 by the congressional joint committee on atomic energy under the title of "Development and Control of Atomic Energy" revealed that the experimental breeder reactor had been put into operation at the reactor testing station at Arco, Ida. It was hoped that this reactor would create more atomic fuel than it consumed.

The reactor uses enriched uranium as fuel and a blanket of natural uranium around the core as the "fertile" area in which breeding may take place. Other reactors under construction at Arco included a materials testing reactor and a land-based prototype of a reactor for submarine propulsion.

Long-range experiments included the design of a homogeneous reactor in which the atomic fuel was mixed with the moderating material in a liquid.

Private Enterprise in Reactors.—The U.S. Atomic Energy commission in June 1951 entered into agreements with four groups of industrial companies for joint studies of ways in which private firms might carry a larger share of the task of developing, building and operating nuclear reactors. The four groups were Monsanto Chemical Co. and Union Electric Co., both of St. Louis, Mo.; Detroit Edison Co. of Detroit, Mich., and Dow Chemical Co. of Midland, Mich.; Commonwealth Edison Co. and Public Service Company of Northern Illinois, both of Chicago; and Bechtel Corp. and Pacific Gas and Electric Co., both of San Francisco.

Radioactive Isotopes.—The U.S. Atomic Energy commission expanded the manufacture and distribution of radioactive isotopes during 1951. Isotopes were shipped to 500 institutions in the United States and to 175 institutions in 31 foreign countries.

Physical Research.—Four new atom-smashers, financed partly or entirely by the U.S. Atomic Energy commission, went into operation during 1951. They included cyclotrons at Oak Ridge National laboratory, Oak Ridge, Tenn., and Brookhaven National laboratory, Upton, N.Y., and synchrocyclotrons at the University of Chicago and Carnegie Institute of Technology, Pittsburgh, Pa.

At Brookhaven, the west face of the research reactor was partitioned off and declassified so that authorized scientists not cleared for access to restricted information could use that face of the reactor for nonsecret experiments.

Fission Products.—Production of plutonium in the gigantic reactors at Hanford, Wash., was accompanied by the accumulation of vast quantities of radioactive fission products. A search for industrial uses for these waste products was initiated with a study by the Stanford Research institute of Stanford, Calif. It was pointed out that five principal capabilities of fission products were that they could kill organisms, induce chemical reactions, ionize gases, activate phosphors and produce rays which penetrate solids.

Dutch-Norwegian Reactor.—A nuclear reactor built jointly by the Dutch and Norwegian governments at Kjeller, 20 mi. N. of Oslo, was dedicated on Nov. 28, 1951. The Netherlands furnished the uranium and Norway the heavy water for the moderator. The uranium had been bought by the Netherlands government in 1939 at the suggestion of W. J. de Haas of Leyden, who foresaw some future importance for the material. During World War II, Dutch scientists misled nazi officials into believing that the uranium stock pile was yellow ochre paint.

Amsterdam Atom-Smasher.—The largest atom-smasher on the continent of Europe was the synchrocyclotron put into operation in Amsterdam in 1951 by the Dutch Atomic Energy commission. While its voltage was only 30,000,000 ev, it had the highest current rating of any cyclotron in existence, from 20 to 40μ amp.

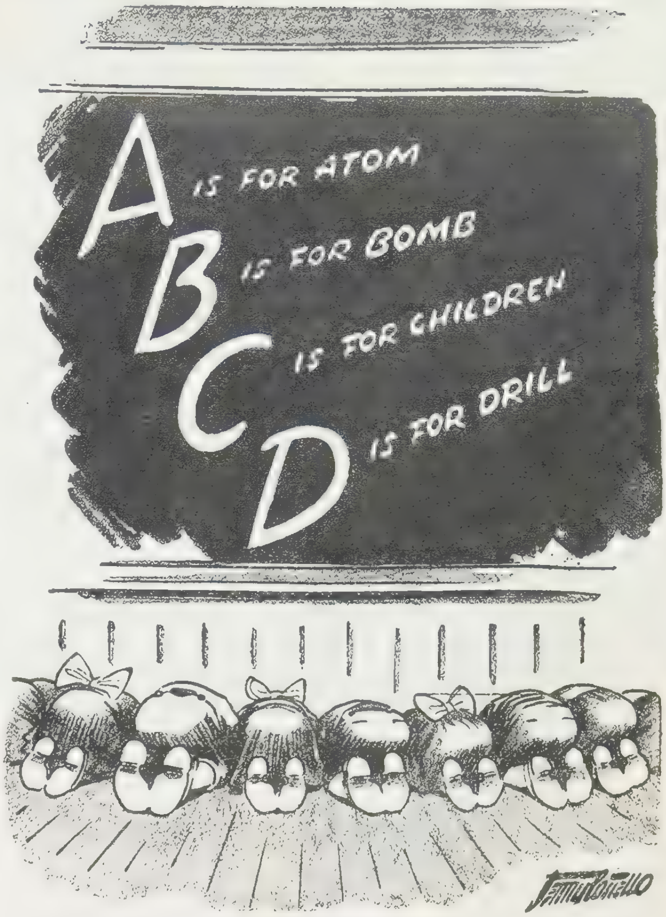
British Atomic Activities.—A heating system using atomic energy, the first of its kind in the world, was placed in operation in Nov. 1951 in an 80-room building at Great Britain's chief atomic research station at Harwell, Eng. Heat from a nuclear reactor was employed to produce hot water which flowed through the heating pipes.

Reports circulating in both London and Washington, D.C., during 1951 held that the British were nearing the perfection of their first atomic bomb and that permission would be sought from the U.S. government to test it in Nevada or at Eniwetok. Prior to resuming the office of prime minister, Winston Churchill criticized the Labour government for its failure to produce an atomic bomb.

Canadian Atomic Activities.—The most powerful source of radioactivity for the treatment of cancer is the cobalt bomb, perfected in 1951 after two years of research by the Eldorado Mining and Refining Co. This company, owned and operated by the Canadian government, is that nation's chief source of uranium and radium.

The first cobalt bomb was put in operation in November at the London, Ont., clinic of the Ontario Cancer foundation. It consisted of an ounce of radioactive cobalt enclosed in a three-and-a-half-ton, lead-lined steel tube. A window at one end of the tube is opened by electrical remote control to permit the momentary escape of radiation for the treatment of a patient.

An ounce of radioactive cobalt, produced at a cost of about $17,500, gives off the same amount of radiation as $50,000,000 worth of radium.



"MODERN EDUCATION," a 1951 cartoon by Costello of the *Knickerbocker News* (Albany, N.Y.)

The radioactive cobalt for the bomb was produced in the NRX reactor at the Chalk River atomic energy establishment, 130 mi. W. of Ottawa. This reactor, until the development of the new U.S. experimental breeder reactor, was the most advanced design in existence. It is characterized by its small size and neutron flux 10 to 20 times as high as other reactors of comparable size.

The reactor is a cylindrical vessel about eight feet in diameter and ten feet high. A total of 176 rods of metallic uranium are contained in a series of tubes in the cylinder. Heavy water is used as a moderator.

A new reactor under construction during the year at Chalk River would be Canada's third and largest. It was to cost $30,000,000 and would bring the Canadian investment in atomic energy equipment to more than $70,000,000.

Argentine Claims Discounted.—On March 24, 1951, Pres. Juan D. Perón of Argentina announced that a process employing a thermonuclear reaction for the controlled release of atomic energy had been perfected by Argentine scientists under the direction of Ronald Richter, Austrian-born director of the Argentine atomic energy project. The announcement was greeted with extreme skepticism by scientists in the United States and Europe.

International Control.—On May 21, 1951, the United States submitted a proposal to a 12-nation committee of the United Nations general assembly for a merger of the United Nations Atomic Energy commission and the Commission for Conventional Armaments. The proposal was bitterly assailed by the U.S.S.R.

On Nov. 8 the United States, Great Britain and France presented a disarmament program to the United Nations general assembly in Paris. The first step would be a census of armed forces and armaments including atomic weapons. The program included the plan for the international control of atomic energy which the general assembly had adopted on Nov. 4, 1948, by a vote of 40 to 6, the soviet bloc casting the negative votes.

The following day Andrei Y. Vishinsky, soviet foreign minister, told the general assembly that the U.S.S.R. would never agree to this plan for the international control of atomic energy.

The U.S.S.R. had insisted upon an immediate destruction of atomic weapons and had expressed the view that there would be a time lag between the declaration outlawing the bomb and the institution of international inspection.

On Dec. 5 France made it clear that it regarded U.S. superiority in atomic weapons as essential to its security and that it would not consent to any plan for their destruction that did not contain complete safeguards against violation of the agreement.

Soviet Atomic Espionage.—Four members of the spy ring which had conveyed atomic information to the U.S.S.R. during World War II were convicted in the federal district court of New York city on March 29, 1951. On April 5, Judge Irving R. Kaufman imposed the death sentence on Julius Rosenberg, 32, an electrical engineer, of New York, and his wife Ethel, 35. Morton Sobell, 34, an electronics expert, of New York, was sentenced to 30 years in prison. David Greenglass, 29, brother of Ethel Rosenberg, was sentenced to 15 years in prison.

The Rosenbergs and Sobell appealed to the U.S. circuit court of appeals and on Aug. 2 were granted until Oct. 15 to file briefs. The spy ring obtained information from three individuals, Klaus Fuchs, German-born British scientist, Alan Nunn May, British scientist, and Greenglass, a United States citizen who worked on atomic weapons at Los Alamos while an army technical sergeant.

British courts sentenced Fuchs to prison for 14 years and May for 10 years. In the U.S., Harry Gold, 40, a biochemist, of Philadelphia, was sentenced to prison for 30 years. He had been the courier between Fuchs and Greenglass and the spy ring.

Another source of secret atomic information became available to the U.S.S.R. in Oct. 1950 when Bruno Pontecorvo, an Italian-born British scientist, fled from England where he had been working at Harwell and disappeared behind the iron curtain. Attlee, Clement Richard

(1883–), British statesman, was born in London on Jan. 3. He was educated at Haileybury and University college, Oxford. After a period of legal practice, he was secretary of Toynbee hall, London, and a lecturer at Ruskin college, Oxford. In 1913 he joined the staff of the London School of Economics. During World War I he served in Gallipoli, Mesopotamia and France. He was first Labour mayor of Stepney, London, 1919–20, was elected member of parliament for Limehouse in 1922, and in the second Labour government was chancellor of the duchy of Lancaster and later postmaster general. He was deputy prime minister in the wartime coalition government and became prime minister when the Labour party achieved a majority in July 1945.

Attlee presided at the meetings of the commonwealth prime ministers which opened in London on Jan. 4, 1951. In a broadcast on Sept. 19, he announced that a general election would be held on Oct. 25. At the Labour party conference at the end of September, he introduced the party's election manifesto and made another offer to the U.S.S.R.: The British government was ready "to meet and deal with the people on the other side of the 'iron curtain' when they made a response, not only in words, but in action."

In the election, Attlee was returned with a majority of 11,574 in his constituency of West Walthamstow, but his party lost its majority and on Oct. 26 he was received by King George VI, who accepted his resignation. (R. JAN.)

Auriol, Vincent

(1884–), French statesman, was born on Aug. 27 at Revel, Haute-Garonne. After receiving his degree of doctor of laws at the faculty of law in Toulouse, he practised in that city. In 1909 he became editor in chief of the newspaper *Le Midi socialiste*. He was elected to the chamber of deputies as Socialist member for Muret (Haute-Garonne) in 1914 and was constantly re-elected up to the collapse of France in June 1940. Auriol's first cabinet post was in Léon Blum's cabinet in 1936, when he was appointed minister of finance. He was minister of justice in the Camille Chautemps cabinet (1937–38) and held a post in the short-lived Blum cabinet in 1938. He was among the 80 French parliamentarians who on July 10, 1940, voted against according full powers to Marshal Henri Philippe Pétain; he was imprisoned by Vichy authorities for several months but was later released. In Oct. 1943 he escaped to London where he joined Gen. Charles de Gaulle's movement. He became a member of the consultative assembly set up in Paris after its liberation in Aug. 1944, and a year later he was appointed minister of state without portfolio in the De Gaulle government. He was elected president of the French constituent assembly on Jan. 31, 1946, and on Jan. 16, 1947, he became the first president under the constitution of the fourth republic.

In March and April 1951 he paid an official visit to the United States and Canada, the first by a president of France while in office. His main theme in the 45 speeches he made in the two countries was an outspoken defense of France against those who doubted its will to resist aggression. He explained recurring ministerial crises by saying that it was not the government team that was changed from time to time, but only the leader. (*See* also FRANCE.) (R. JAN.)

Austin, Warren Robinson

(1877–), U.S. delegate to the United Nations, was born at Highgate, Vt., on Nov. 12, and was graduated from the University of Vermont, Burlington, in 1899. He practised law and became active in Republican politics. Elected U.S. senator from Vermont in 1931 to fill an unexpired term, he was re-elected in 1934 and 1940, but resigned to become acting U.S. representative to the United Nations, by appointment of Pres. Harry S. Truman, on June 5, 1946. On Jan. 13, 1947, Austin became U.S. representative at the seat of the United Nations with the rank of envoy extraordinary and plenipotentiary, and U.S. representative on the Security council, as well as member of the U.N. Atomic Energy commission. In the United Nations he frequently had occasion to represent western viewpoints against the U.S.S.R. and its bloc. In Jan. 1951 he offered a seven-point resolution in the United Nations to pave the way for sanctions against red China, because of that country's intervention in the Korean war. At the same time he offered to keep the way open for further negotiations, with both China and North Korea. He appealed in a radio broadcast in April to other members of the U.N. to provide proportionate shares of their manpower to the armed forces in Korea. Expressing official U.S. views, he warned Communists in Asia that the United Nations would fight until the reds had had enough.

Australia, Commonwealth of.

A self-governing member of the Commonwealth of Nations, Australia is situated in the southern hemisphere. Areas and populations of the six federated states, Australian Capital Territory and Northern Territory are:

States and Territories	Capital	Area (in sq.mi.)	Population (1947 census)	Population (Dec. 1950 est.)
New South Wales	Sydney	309,433	2,985,464	3,278,036
Victoria	Melbourne	87,884	2,055,252	2,231,255
Queensland	Brisbane	670,500	1,106,269	1,191,245
South Australia	Adelaide	380,070	646,216	712,010
Western Australia	Perth	975,920	502,731	573,671
Tasmania	Hobart	26,215	257,117	294,397
Northern Territory	—	523,620	10,866	15,131
Australian Capital Territory	Canberra	939	16,905	20,054
		2,974,581	7,580,820	8,315,799

In 1944 fullblood aboriginals were estimated at 47,000 and half-castes numbered 24,881. Territories under the administration of the commonwealth but not included in it comprise Papua Territory, Northeast New Guinea, Norfolk Island, the territory of Ashmore and Cartier islands and the Australian antarctic territory. Language: English. Religions (census, 1947): Anglican 2,957,032, Roman Catholic 1,569,726, Methodist 871,425, Presbyterian 743,540, Baptist 113,527, Lutheran 63,243, other Christian 354,443; Jewish 32,019. Chief towns (pop., 1949 est.): Sydney (1,550,000); Melbourne (1,288,000); Adelaide (470,000); Brisbane (430,000); Perth (294,000); Newcastle (1947, 127,188); Hobart (1950 est., 84,000). Governor general: Sir William McKell; prime minister: Robert Gordon Menzies.

History.—During the first quarter of 1951 outstanding events were the passage of the much-disputed Communist Party Dissolution act, after Labour party opposition had been suddenly withdrawn, and other legislation, particularly the Commonwealth Bank Amendment act to restore control by a board, which the Labour-controlled senate had held up. On the application of the government the governor general held that this bill had "failed to pass both houses" and a double dissolution was granted. In the election that followed, the Liberal-Conservative government was returned with a majority in both houses, although that in the house of representatives was reduced.

H. V. Evatt, deputy leader of the Labour party, led an application by several unions to the high court to test the Communist Party Dissolution act which affected trade-union leaders alleged to be Communists. The court held the act to be unconstitutional. The government proceeded in the new parliament to enact law to hold a referendum to give it powers to pass the disputed bill into law and also to pass similar or related matters. The referendum was defeated by an absolute majority in the commonwealth as a whole and in three of the six states. On June 13 the whole commonwealth was overshadowed by the news of the sudden death in Canberra of J. B. Chifley, leader of the Labour party and former prime minister. In Victoria an act to provide for the election of the legislative council by adult franchise was passed just 100 years after its establishment and 93 years after attempts were first made to secure such election.

Foreign Affairs.—Australia's contribution to the Korean war continued with the engagement of all three arms of the services. The Japanese peace treaty was supported by the Australian government but there was strong resistance from the Labour party with no occasion for a vote in the house. Australian foreign policy continued to move closer to that of the United States, which offered Australia assurances of assistance in the event of attack. During the year a meat marketing agreement was signed with the United Kingdom under which Australian producers were guaranteed for several years 1951 prices as minima.

JUBILEE PROCESSION held in Sydney on Jan. 29, 1951, celebrating 50 years of federation in Australia. This float symbolized the growth of music and carried the names of Australian musicians and composers

Industrial and Economic.—There were few strikes and none of more than local significance. The most notable event was a marked increase in inflation. Economic activity continued at much above full employment level. The setback in wool prices had had no apparent deflationary effects by the end of the year. The average total personal income in 1950–51 was £A2,916, an increase of 24% over 1949–50. There were 2,629,600 wage and salary earners in employment; nominal unemployment was shown at 0.8% and less.

The rise in the value of exports continued to be the main force behind inflation. Exports in 1950–51 were £A984,000,000, an increase of £A370,000,000, or more than three times the previous highest annual increase. Imports reached £A742,000,000, an increase of £A206,000,000 over the year before. The factors in the balance of payments were unable to prevent a fall in overseas funds. The dollar loan obtained from the International Bank for Reconstruction and Development was allocated during the year.

The 1950–51 actual commonwealth budget expenditure was £A881,000,000, and there was a net increase in government indebtedness during the year of £A94,000,000; part of this was financed by loan money and part by the issue of treasury bills. Approximately 37% of revenue came from indirect taxes and 54% from direct. It was expected that the 1951–52 budget would maintain a high expenditure, with an increase on war and defense to £A200,000,000, but that there would be some reduction in other directions. The main anti-inflationary device of this budget was increased taxation, mainly indirect. Taking all these matters into consideration it was possible that deflationary influences might be operating in the Australian economy, but this would depend particularly upon the level of U.S. and European buying.

Immigration and Housing.—Permanent new arrivals during the year were 154,290. Easy absorption of immigrants into primary and secondary industries continued, but the housing of them became more acute. During the year 1949–50, 55,485 houses were completed, an increase of 4,146 over the year before. Although these were the highest figures ever reached in any one year they were still below the requirements of existing population demands for new houses and normal replacements.

General.—The most conspicuous feature of the year was high money incomes and inflation. In all fields money demand was so high that resources were strained beyond capacity. Inflation moved from a suppressed state into an open or uncontrolled one. Politically, the characteristics were uncertainty and lack of positive government action, much of the time of parliament being taken up with the abortive attempts to provide new legislation to deal with the Communist party. Again, in this respect, the difficulties in the way of changing the constitution were revealed. (J. F. C.)

Education—(1950) State schools 7,969, pupils 869,906, teachers 33,271; private schools 1,835, pupils 281,056, teachers 12,425; universities 8, students 33,000.

Finance and Banking.—Budget: (1951–52 est.) revenue £A1,041,500,000, expenditure £A927,000,000. National debt (Dec. 1950): £A1,850,900,000. Currency circulation (July 1951) £A275,000,000. Gold and foreign exchange (March 1951) U.S. $1,878,000,000. Bank deposits (July 1951) £A1,100,000,000. Monetary unit: Australian pound, with an exchange rate of £A1.25 to the pound sterling and £A0.45 to the U.S. dollar.

Foreign Trade.—(1950) Imports £A630,000,000; exports £A744,000,000. Main sources of imports (1950–51): U.K. 48.1%, U.S. 8.2%, India 4.8%. Main destinations of exports (1950–51): U.K. 32.5%, U.S. 15.2%, France 9.2%. Main imports: machinery 24%; piece goods 14%; vehicles 12%; oils 10%. Main exports: wool 65%; wheat and flour 11%; meat 3%; metals, minerals and ores 4%.

Transport and Communications.—Roads (1946 est.): 500,497 mi. Licensed motor vehicles (Dec. 1950): cars 876,902; commercial 475,926. Government railways (1949–50): 26,980 mi.; passenger journeys 504,600,000; freight carried 40,600,000 tons; train-miles run 93,300,000. Shipping (merchant vessels of 100 gross tons and over, July 1950): 355; total tonnage 541,424. Air transport (1950): miles flown 44,000,000; passenger-miles 788,000,000; freight, including mail, net ton-miles 31,400,000. Telephones (March 1951): instruments 1,182,035. Radio receiving set licences (March 1951): 2,074,775.

Agriculture.—Main crops (metric tons, 1950–51): wheat 4,981,000; oats 471,000; barley 517,000; maize (1949–50) 160,000; sugar, raw value, 920,000; potatoes 500,000. Livestock (March 1950): sheep 112,891,000; cattle 14,640,000; pigs 1,123,000; horses 1,057,000. Wool production (greasy basis, 1950) 534,000 metric tons. Milk production (1950–51) 1,211,000,000 gal. Food production (metric tons, 1950–51): butter 162,400; cheese 45,300; meat 1,028,400, of which beef 660,000.

Industry.—Manufacturing establishments (1948–49) 40,010; persons employed, including working proprietors, 890,454. Fuel and power (1950): coal 16,788,000 metric tons; lignite 7,416,000 metric tons; manufactured gas 1,064,000,000 cu.m.; electricity 10,251,000,000 kw.hr. Raw materials (metric tons, 1950): refined copper 13,800; refined lead 203,000; zinc 85,000; pig iron 1,336,000; steel ingots and castings 1,448,000; gold 861,000 fine ounces. Manufactured goods (metric tons, 1950): wool yarn 21,500; cement 1,278,000. New dwelling units completed numbered 52,884 in 1949 and 61,884 in 1950.

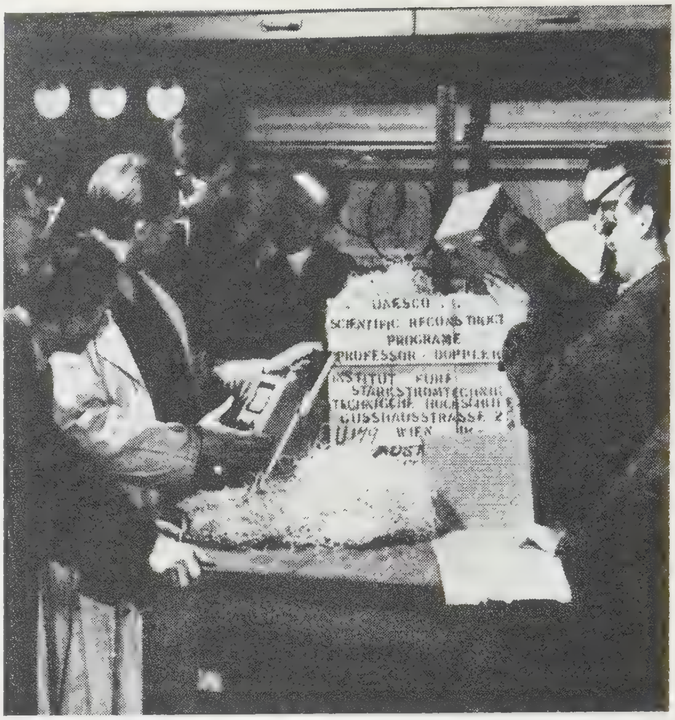
Austria.

A republic of central Europe, Austria has an area of 32,375 sq.mi. Pop. (1951 census) 6,881,100. Language: German 98%, other 2% (mainly Slovene in Carinthia). Religion: mainly Roman Catholic. Principal towns (pop. 1951 census): Vienna (cap., 1,760,784); Graz (226,271); Linz (185,177); Salzburg (100,096); Innsbruck (94,599); Klagenfurt (62,792). President, Theodor Koerner (*q.v.*); chancellor, Leopold Figl. The Austrian government had jurisdiction throughout Austria, with certain limitations regarding matters control over which was reserved to quadripartite decision in the Allied Council for Austria. By Dec. 31, 1951, members of the A.C.A. were: France, Jean Payart; United Kingdom, Sir Harold Caccia; U.S., Walter J. Donnelly; U.S.S.R., Lieut. Gen. V. P. Sviridov.

History.—Throughout 1951 unsuccessful attempts were made to persuade the soviet government to do away with the special permits necessary to enable citizens of the three western occupation zones to travel through the soviet zone. Attempts to induce the soviet government to sign the Austrian peace treaty were again unsuccessful. The points of difference on the treaty itself were narrowed down to four minor ones but the soviet government made its signature dependent on acceptance by the west of various matters entirely unconnected with the treaty.



UNIVERSITY OF VIENNA students unpacking a shipment of scientific equipment purchased under the U.N.E.S.C.O. gift coupon program launched in 1951. The coupons were an international currency for use by educational institutions in securing books, films, laboratory equipment, etc.

In these circumstances, the Austrian scene continued to be dominated throughout the year by the wider question of the relations between the four great powers. While the U.S. government poured $104,360,000 into Austria through the medium of the Economic Cooperation administration (July 1, 1950, to June 30, 1951), the soviet government took at least $50,000,000 out through the network of former German firms and undertakings administered by the U.S.I.A. (Upravlenye Sovietskim Imushchestvom v Avstrii, or, Administration of Soviet Properties in Austria). About one quarter of this sum was the value of oil from the wells round Zistersdorf in the soviet zone of Austria. During the year, the U.S.I.A. extended its operations by setting up a large number of retail stores in the towns of the soviet zone and the soviet sector of Vienna. The U.S.I.A. stores imported goods free of customs duty and most of them, like the U.S.I.A. factories, did not pay taxes or social insurance contributions. Consequently they competed on specially favourable terms with Austrian private enterprise. The non-Communist political parties called on their followers to boycott the U.S.I.A. stores and most Austrians did so.

In spite of the E.C.A. help, the Austrian economy again found itself in serious difficulties. A new wage-price agreement (the fifth since Aug. 1947) had to be negotiated in July 1951. This was followed by an all-round increase in rents in the autumn. Though the changes were not accompanied by Communist-inspired riots as in 1950, they meant hardship for many people. The prices of many consumer goods and also bread were subsequently reduced slightly but the economic crisis was not solved. Austrian imports during the year, excluding Marshall plan aid, were greatly in excess of exports and it was clear that productivity would have to be raised if the country was to avoid a drastic decline in its standard of living.

Considerable progress was made during the year in developing

Austria's water power resources. The first half of the giant hydroelectric station at Kaprun which harnesses water from glaciers around the Gross Glockner was completed in Sept. 1951. Electrification of the Austrian railway system also progressed considerably. Reconstruction of buildings destroyed during World War II continued on an increased scale. Thanks largely to this, unemployment which reached the high level of 219,490 in February fell to 79,581 in June 1951. This was the lowest figure recorded since the war. On the other hand there was a serious shortage of coal.

Much of the reconstruction in all fields was the result of the release of E.C.A. counterpart funds. In September, General Sviridov, the soviet high commissioner, accused the three western occupying powers of remilitarizing Austria under the pretense of reconstruction. His accusation, raised under the heading "other business" at a meeting of the Allied council, touched off a furious campaign in the Communist press. The Austrian "Peace council" later published a White Book of specific charges which was given to the delegates of the World Peace council who met in Vienna in November. At a meeting of the Allied council on Nov. 30, the soviet representative brought forward a resolution in two parts, one calling for a quadripartite commission of inspection and the other requiring the council to write to the federal chancellor ordering him to reduce the number of *gendarmerie*, cease the construction or reconstruction of military installations, switch all military production to peacetime needs and repeal various measures aiming at remilitarizing Austria. The U.S. representative tabled a substitute resolution which declared that internal security was the affair of the Austrian government, demanded the restoration of interzonal freedom of movement so that everyone could judge of the truth of the militarization charges for themselves and the immediate signing of the peace treaty. All three western representatives dismissed the soviet charges as having been advanced purely for propaganda purposes.

In the political sphere, the year was marked by the election at the second ballot on May 27, 1951, of Theodor Koerner, formerly Socialist burgomaster of Vienna, as president of the republic in succession to Karl Renner who died on Dec. 31, 1950. Relations between the three western powers and the Austrian government continued to improve. Progress was also made in dealing with the grievances of Austrians in the south Tirol and in establishing more friendly relations between Austria and Yugoslavia, which dropped all territorial claims against Austria in the course of the year. The soviet government refused to accept the Austrian proposal, supported by the three western powers, to abolish the so-called Austrian censorship. Accordingly, on Nov. 21 the Austrian postal authorities gave notice to the 863 employees of the department that their employment would cease on Jan. 1, 1952. The Austrian government also failed to get satisfaction from the soviet authorities on the subject of prisoners of war and Austrian political prisoners in the U.S.S.R. Such prisoners were, however, allowed to write to their families after Sept. 5, 1951. (G. Ls.)

Education.—Schools (1949–50): elementary and private 5,073, pupils 846,846, teachers 35,874; secondary 168, pupils 50,140, teachers 3,550; technical and commercial 63, pupils 17,623, teachers 1,738; teachers' training colleges 28, students 4,338, lecturers 530; universities 4, students 17,029, professors and lecturers 1,787.

Finance and Banking.—Budget: (1950 actual) revenue 12,023,000.000 schillings, expenditure 12,234,000,000 schillings; (1951 est.) revenue 11,869,000,000 schillings, expenditure 12,570,000,000 schillings. Internal debt (Dec. 1949) 11,826,000,000 schillings. Currency circulation (July 1951) 6,796,000,000 schillings. Bank deposits (June 1951) 8,197,000,000 schillings. Monetary unit: schilling, with an exchange rate (Nov. 1951) of 60.20 schillings to the pound and 21.49 schillings to the U.S. dollar.

Foreign Trade.—(1950): imports 7,092,000,000 schillings; exports 6,516,000,000 schillings. Main sources of imports (1950): U.S. 23%; Germany 17%; U.K. 8%; Italy 7%. Main destinations of exports: Germany 16%; Italy 13%; Czechoslovakia 6%; U.S. 6%. Main imports: coal, machinery and vehicles, and grains. Main exports: iron, steel and manufactures, textile manufactures and wood.

Transport and Communications.—Roads (1947): 53,000 mi. Licensed motor vehicles (Dec. 1950): cars 45,000, commercial 48,000. Railways (March 1951): 3,761 mi.; passenger-miles (1950) 2,670,000,000; freight ton-miles (1950) 3,311,000,000. Telephones (1950): subscribers 261,000. Radio receiving set licences (1950): 1,200,000.

Agriculture.—Main crops (metric tons, 1951): wheat 400,000; barley 263,000; oats 330,000; rye 415,000; sugar 95,000; (1950): maize 150,000; potatoes 2,548,000. Livestock (Dec. 1950): cattle 2,279,000; sheep 363,000; pigs (March 1951) 2,094,000; horses 283,000; goats 323,000; poultry 6,934,000.

Industry.—Insured persons employed (Aug. 1951): 2,046,000. Fuel and power (1950): coal 182,000 metric tons; lignite 4,308,000 metric tons; manufactured gas 356,000,000 cu.m.; electricity 4,908,000,000 kw.hr.; crude oil 1,525,000 metric tons. Raw materials (metric tons, 1950): iron ore 1,860,000; pig iron 883,000; steel, ingots and castings 943,000; magnesite 545,000; lead, smelter 9,200. Manufactured goods: woven cotton fabrics 13,400; cotton yarn 19,400; wool yarn 11,000; rayon staple fibre 31,100; fertilizers 364,000; chemical pulp and paper 489,000.

Automobile Industry.

Instead of the emphasis on production which resulted in an all-time record of 8,002,782 vehicles manufactured in the United States in 1950, the industry in 1951 was engaged in a worried, losing struggle to keep in full operation. In spite of production curtailments and scattered strikes, however, the automobile makers managed to produce 5,336,000 passenger cars and an all-time record of 1,430,000 trucks. The total of 6,766,000 vehicles was second only to the 1950 mark. This 15% drop in output was in sharp contrast to some pessimistic predictions early in the year that by August materials shortages would cut automobile production by 50%.

The most unfavourable factor in the production struggle was the materials shortage. The newly formed National Production authority (NPA) became the barometer for the industry. With more and more critical material being used, allocated or stockpiled for defense, less and less was left for civilian production and the automobile industry.

The year was further marked by a continuous stream of war contract announcements and construction of new and additional defense plant space. But despite the large volume of defense contracts which was poured into the industry automobile production curtailments ran ahead of actual work on defense orders, most of which were still in the preparatory stages of plant construction, tooling, etc. As the year ended, thousands of automobile workers were idled.

Table I.—*Monthly Production of U.S. Vehicles, 1951*

	Passenger cars	Trucks	Buses	Total
January	478,589	127,583	661	606,833
February	505,865	111,935	521	618,321
March	617,399	136,794	829	755,022
April	503,038	135,415	819	639,272
May	511,938	140,047	742	652,727
June	482,029	134,818	838	617,685

New Models.—Three new lines appeared during the year, all outside the standard big-car field. The "Nash-Healey" was a two-passenger sports car to be produced for the Nash-Kelvinator Corp. by the Donald Healey Co. of England; the "Aero Willys" was a light car to be produced by Willys-Overland Motors, Inc.; the other was a modified version of the "Henry J" to be produced by Kaiser-Frazer Corp. and distributed solely by Sears, Roebuck & Co. under its own brand name, "Allstate."

The popularity of the "hard top" continued to increase in 1951 and by the end of the year all but two manufacturers offered hard top styling on at least one line of car.

Defense Production.—The year 1951 saw the beginning of the second large-scale U.S. defense mobilization within ten years. Pres. Harry S. Truman's state of the union message revealed that the country's industrial structure was being geared for an annual production of 50,000 military planes and 35,000 tanks. This meant that the automobile industry was to be vitally involved, and its response was indicated by the achievement of one manufacturer in delivering the first of a new type of light tank approximately three months ahead of schedule.

Table II.—*U.S. Motor Vehicle Production, 1945–51*

Year	Passenger cars	Trucks and buses	Total
1945	69,532	655,683	725,215
1946	2,148,699	940,866	3,089,565
1947	3,558,178	1,239,443	4,797,621
1948	3,909,270	1,376,274	5,285,544
1949	5,119,466	1,134,185	6,253,651
1950	6,665,863	1,337,182	8,003,045

An inevitable result of the sudden conversion to defense production was a critical shortage of machine tools as well as other vital materials. Hundreds of machine tools put away after World War II as a moth-ball fleet were being rehabilitated and modified for new defense production assignments.

By mid-October it was evident that all the car manufacturers were going to be able to offer new models for 1952, but this was only because they were already far along in their tooling programs.

In November the NPA stopped major model changes in automobiles after Feb. 1, 1952, by placing a ban on unrated machine tool shipments.

In the midst of all this, the automobile makers were engaged in a determined campaign to establish the essentiality of the automobile as a tool rather than a luxury. This was an effort both to avoid a repeat of the wartime shutdown of passenger-car production lines, and to hold down excise taxes, which were threatening to rise to 20%. A survey conducted during Jan. and Feb. 1951 revealed that 73% of the nation's cars were used wholly or partly for work, and that 92% were used for work, shopping or both. There were some indications that the campaign was successful. A defense official stated that with industry moving outside cities, the passenger car had become essential for getting workers to the plants.

A later report, by the Brookings institution, also defended the essentiality of the car and maintained that the existing annual rate of 4,000,000 passenger cars was a desirable minimum production.

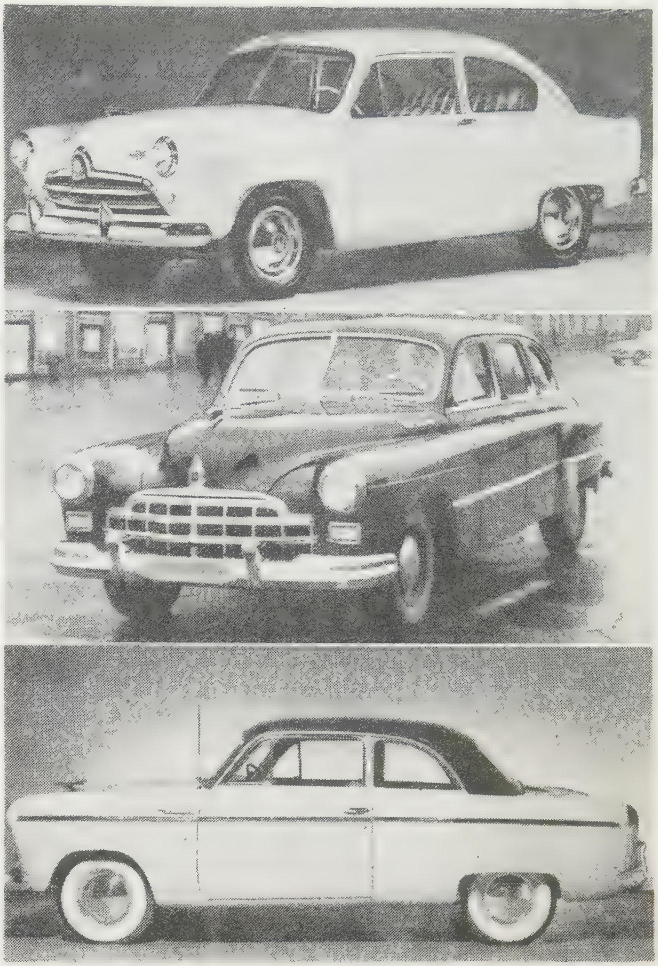
Materials.—Materials shortages and allocations were responsible for most of the woes of U.S. automobile manufacturers during 1951. NPA decrees were issued almost daily, and the vast number of revisions made necessary by the ever-changing materials situation only added to the confusion already prevalent in the industry.

Early in the year, boron-treated steels were offered as a substitute for scarcer alloy steels. But even substitutions such as this could not make the supply of steel meet the needs of both defense and civilian production. The NPA cut passenger-car steel 20% for the second quarter, with a forecast of a 10% additional cut for the third quarter. By June 1 the supply had to be cut another 5%, and quotas for the third quarter were lowered to 65% of the monthly consumption during the first half of 1950. By the final quarter, steel allocations for the industry had been dropped to 58% of the pre-Korean war level. As part of the effort to keep up the supply, a concerted drive was begun to recover dormant scrap steel and iron from industry and commercial establishments.

A gradual increase in the supply of synthetic rubber resulted in an alleviation of the rubber shortage that threatened in the first half of the year. White sidewalls on tires were banned by the NPA in February. Two months later the quota of tires and tubes for new cars was cut 25%, followed immediately by a ban on the fifth or spare tire for new passenger cars. The next order limited tire retailers to a 30-day supply and finally, in mid-July, the spare-tire ban was lifted.

One of the first warnings that cars might be looking different in the future was the NPA order that banned the use of nickel in automobile brightwork after March 1. This order was expanded in late summer by the ruling that no more nickel-bearing stainless steel could be used for decorative purposes. As far as the 1951 models were concerned, however, substitutions and new plating techniques kept the brightwork plentiful.

Already on the critical list, the nation's supply of copper was hit late in the year by a strike of 58,000 miners and smelter workers in the copper and nonferrous industry that resulted in an estimated loss of 40,000 tons of copper. To give relief to industry, 55,000 tons of copper were released from government



AUTOMOBILES FIRST SHOWN IN 1951. Top: the 1952 Allstate, introduced by Sears, Roebuck & Co. for the first large-scale merchandising of automobiles through department stores; centre: the ZIM, a soviet-built automobile; bottom: the 1952 Willys-Overland, first passenger sedan built by that company since 1942

stock piles, but fears were still prevalent that the copper shortage might cause a complete shutdown of the automobile industry.

Already, one manufacturer was using steel for radiator tanks, and others were considering the use of copper-clad steel in place of brass.

Effective Oct. 1, another order aimed at conserving scarce materials was issued which raised a storm of protest from several manufacturers. This decreed that automatic transmissions could be installed on only 35% of the production of automobiles retailing at the factory for less than $1,800, and 65% of the production of cars retailing at the factory for $1,800 to $2,500. Over $2,500 there was no limitation imposed. With automatic transmissions being installed on almost 100% of some automobiles in the $1,800 to $2,500 range, the order was bound to have a drastic effect, especially since increased facilities for producing standard transmissions were not available.

Prices and Wages.—The first move in the 1951 fight to halt the spiralling rise of prices and wages was an order by the Economic Stabilization agency freezing most prices and all wages at the Jan. 25, 1951, level. The prices of automobiles, which had been rolled back in Dec. 1950 after an attempted price increase, were placed under an Office of Price Stabilization ceiling, effective March 2. The day before this ceiling went into effect, the OPS allowed a 3.5% increase to offset, partially, increases in production costs. A promise of relief from this ceiling was offered to the industry at the end of July, when the new Defense Production act of 1951 was passed. The Capehart amendment to this act allowed manufacturers to apply for a higher price ceiling to be based on pre-Korean war prices, plus all reasonable cost increases up to July 26, 1951. The difficulty was that the formula on which these increases were to be based was not made known for another four months. As a temporary relief, prices were allowed to go up after Labor day by an average of 5% to 6% at the manufacturers' level. This increase was to be considered as part of any later increases allowed under the Capehart provision. At the end of the year, the Capehart formula was finally issued, and manufacturers were invited to submit their figures for price increase permission.

On Nov. 1 automobile excise taxes were raised from 7% to a new rate of 10%. Truck excise taxes rose from 5% to 8%. The tight credit rules of regulation W were eased somewhat by another provision of the Defense Production act which extended the term of payments from 15 to 18 months, but down payments of one-third were still required.

The issue of wages under the freeze caused many complaints from labour, which feared that the freeze order, even with an allowed increase of 10% over the level of Jan. 19, 1950, threatened existing contracts including quarterly cost-of-living and annual productivity increases. Within a short time, however, cost-of-living increases were approved, and a four-cent productivity increase was granted.

The cost-of-living increases granted for each of the four quarters of 1951 were, respectively, five cents, three cents, one cent and one cent per hour.

Unemployment.—By late June the growing list of unemployed automobile workers had reached such proportions that Sen. Blair Moody (Dem., Mich.) demanded a congressional investigation of materials cutbacks and the threat of mass unemployment in the automobile industry. Subsequently, a special senate subcommittee was set up to investigate the spread of unemployment in peace-time industrial centres, with Senator Moody as chairman. In July, the president announced that he had directed the defense agencies to review Detroit's unemployment situation, and three months later he said that the defense mobilization administrators would be asked to alleviate conversion unemployment there.

At the year's end, however, there were more than 100,000 unemployed workers in metropolitan Detroit alone—an increase of 30% from the first of the year.

Engineering.—The 1951 models brought another boost in horsepower, the highest available in a standard engine being 180 h.p. A major innovation introduced by one manufacturer was power steering, in which two hydraulically operated pistons do the work of steering. The manual effort involved was said to be one-fifth that of conventional steering, and in the event of failure of the hydraulic system, the car could still be manually controlled. One of the early-appearing 1952 models offered power braking, a device operating on the engine vacuum, which reduced pedal pressure by 40% and driver reaction time 29%. "Feel" of the brakes was retained by the resistance of a small vacuum diaphragm. In case of engine stoppage, a vacuum reserve was sufficient for three complete stops.

In early May, General Motors Corp. announced the results of tests on a standard car equipped with a new 12:1 compression ratio engine and an improved automatic transmission. With the engine displacement chosen to give approximately the same horsepower as the stock engine, a fuel saving of 30% was achieved. The chief deterrent to production of this engine was reported to be the fact that available gasolines were not yet up to the required octane number for the engine. The automobile involved was a Cadillac.

Three rolling laboratories—futuristic automobiles equipped with experimental devices and engines of horsepower ratings from 300 to 310, were unveiled, two by General Motors Corp. and the other by the Chrysler Corp. Two of the engines, operating at 10:1 compression ratio, required a mixture of alcohol and gasoline; the third, with a compression ratio of 8:1, used commercial premium grade gasoline.

In midyear, General Motors announced that it was designing a 300-h.p. gas turbine to investigate the use of turbine plants on civilian vehicles. This was to be installed in a bus for road testing when completed, and represented the first efforts of the automobile industry in this field.

Design.—Interest in automobile design came from an unexpected source in late summer when the Museum of Modern Art, New York city, selected eight cars for their "excellence as works of art and for their relevance to contemporary problems of car design." Three of these cars on exhibit were American, but none of the three represented contemporary trends in automobile styling. Two were extinct lines of car and the third was the "Jeep," selected as a "genuine expression of machine art." (*See* also MOTOR TRANSPORTATION; MUNITIONS OF WAR: ARMY.)

Automobile Racing.

Roaring over the 500 mi. in record time, Lee Wallard of Altamont, N.Y., won the Indianapolis Memorial day race, blue-ribbon event of the sport. Piloting a Belanger Special, Wallard was timed at 3 hr. 57 min. 38.05 sec. for an average speed of 126.244 m.p.h. He received a purse of $63,612 in prizes, which was a new high for the classic. Finishing second in the long test witnessed by 150,000 spectators was Mike Nazaruk, a newcomer from East Meadow, L.I., N.Y., who drove a Robbins Special. Third money went to Jack McGrath of Glendale, Calif., who had a relief driver, Manuel Ayulo of Burbank, Calif.

Tony Bettenhausen of Tinley Park, Ill., a consistent winner all season, captured the scoring championship of the American Automobile association.

Al Rogers of Colorado Springs, Colo., took first money of $5,400 in the annual Pikes Peak race with his fourth straight triumph in the event.

Lieut. Col. A. T. Gardner, 60-year-old Englishman, broke ten U.S. and six international class F marks in speed trials at Bonneville Flats, Utah, Aug. 20. Gardner drove his Magic Midget at 139.3 m.p.h. in a one-hour run from a flying start for one of his new U.S. records. He set a one-hour international standard for small cars at 137.4 m.p.h.

The second Pan-American highway race for stock sedans that ended at Juarez, Mex., on Nov. 25 was won by Piero Taruffi of Rome driving a Ferrari. Covering the paved highway distance of 1,933 mi. in 21 hr. 57 min. 52 sec., Taruffi took a purse of $23,180. Another Italian, Alberto Ascari of Milan, who also piloted a Ferrari, was second, and Bill Sterling of El Paso, Tex., driving a Chrysler, was third. (T. V. H.)

Aviation, Civil.

As of the midyear of 1951, there were 3,830 transport aircraft in operation by 217 common carrier air lines throughout the world. Of these planes 80% were manufactured in the United States, 13% in the United Kingdom and the remaining 7% in Australia, Canada, France, Germany, Italy, Peru, Sweden and the U.S.S.R. Since 1949 there had been little change in the over-all total of aircraft in air line service. The number of larger, faster four-engined transports, however, had steadily increased until it stood at more than 1,000 by the end of 1951; while the number of single-engined and three-engined planes in operation had proportionately declined.

Table I.—*U.S. Commercial Air Transport Industry*

(Calendar year)

Item	1950 (actual)	1951 (est.)	Per cent increase
Traffic			
Revenue passengers	19,083,517	24,416,000	28

*Decrease.

Scheduled carriers of the United States and its territories operated almost one-third of the total world fleet, or 1,218 planes as of July 1951. The United Kingdom had the second largest fleet, with 240 aircraft. Next in order were Australia with 201 transport aircraft in common carrier service; Brazil with 186; Mexico with 155; France with 135; Canada with 128; India with 117; and Colombia with 96. Considerably more than half the world air transports in scheduled service flew the flags of western hemisphere countries.

U.S. Air Transport Industry.—Air transportation in the United States showed a spectacular growth in every respect during 1951, stimulated by the defense mobilization program which, in the period since the outbreak of the Korean war, brought production and business activity to the highest levels in the nation's history. Revenue passengers increased from about 19,000,000 to more than 24,000,000, a gain of 28%, while revenue passenger-miles flown were up 30%, to more than 14,000,000,000. For the first time, U.S. air transportation became a $1,000,000,000 industry.

The figures in Table I include the operations of the five principal divisions of the industry; *i.e.*, the 16 domestic trunk air lines, the 10 international lines under the U.S. flag, the 15 domestic local service air carriers, the 4 certificated cargo air lines and more than 50 irregular service operators. They do not include three territorial air lines, Alaskan air services, other than Pan American Airways, and a substantial number of smaller irregular service carriers for which data were incomplete. Actually, the highest percentage increases during the year were recorded by the local service air lines, the cargo operators and the irregular carriers. The U.S. flag international air lines showed the smallest percentage gain, as shown in Table II.

Passenger traffic on commercial air carriers had by 1951 forged well ahead of Pullman traffic, which totalled 9,340,000,000 passenger railroad-miles in 1950 and was not expected to exceed 11,000,000,000 in 1951. With the introduction in 1952 of lower air-coach fares on a far wider scale than ever before attempted, this dominance of air passenger travel was expected to increase during the year 1952.

The Trend to Lower Fares.—After years of pioneering effort, primarily by the U.S. irregular, domestic operators, the idea

Table II.—*Principal Divisions of U.S. Air Transport*

(Calendar year)

Item	1950 (actual)	1951 (est.)
Revenue ton-miles		
Domestic trunk lines	963,257,032	1,206,808,000
Domestic local service lines	20,267,842	30,868,000
International carriers	319,576,173	356,761,000
Certificated cargo lines	71,415,460	100,000,000
Irregular carriers	113,000,000	186,000,000

International carriers	258,405,415	278,916,000
Certificated cargo lines	12,360,169	16,700,000
Irregular carriers	35,813,710	54,500,000
Total operating revenues	$858,596,708	$1,043,335,000

of a second-class or coach service at less than first-class rates finally caught on all over the world. The scheduled air lines of the world were being ushered into the mass transportation business in 1952, almost despite themselves. Instead of about six cents a mile, transcontinental fares on the coach services were expected to average about four cents a mile. Coast-to-coast flights would cost $99 or less. Coach fares between New York city and Miami, Fla., would drop to three and one-half cents a mile, to match those between Los Angeles and San Francisco, Calif. Meanwhile, first-class rates on railroads in the U.S. averaged four and one-fourth cents per mile or higher.

Under pressure from United States carriers, the other member air lines of the International Air Transport association agreed to start transatlantic air-coach service May 1, 1952. New York-London round trips, which formerly cost $711 in the vacation season, would be available, air coach, for $486. An overnight ocean crossing at this rate would put a vacation in Europe within the reach of a greatly increased number of Americans, and it was estimated that total transatlantic air travel would increase from 339,000 passengers in fiscal year 1951 to more than 500,000 by 1953.

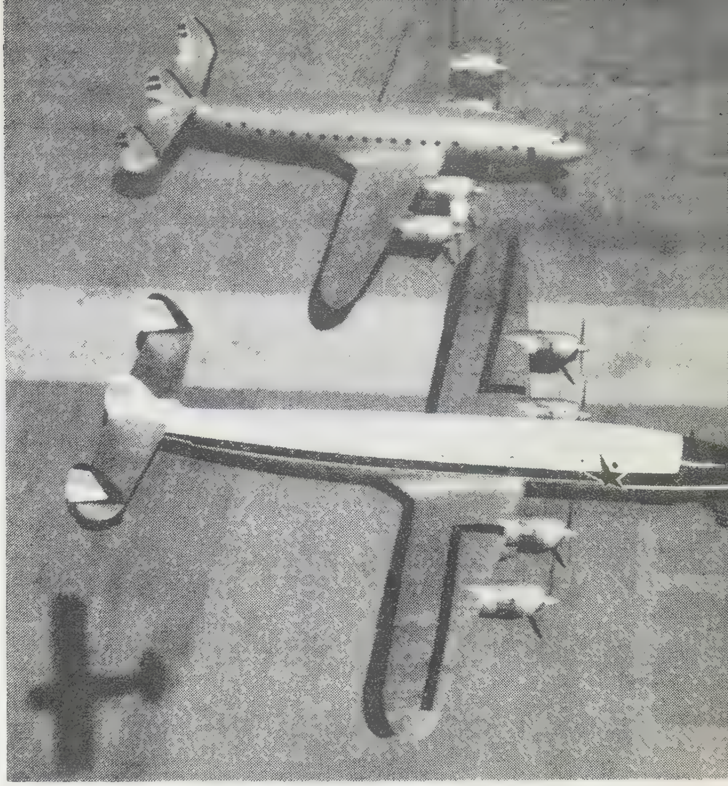
U.S. flag carriers had faced increasingly stiff competition on the heavily travelled Atlantic routes in the previous few years. Immediately after World War II, before Europe had rebuilt its civil air fleet, U.S. operators had the field largely to themselves and carried about 95% of the traffic. By the fiscal year 1951, United States flag lines traffic accounted for only about 60% of the passengers arriving from Europe. (*See* also CIVIL AERONAUTICS ADMINISTRATION.)

Record Transport Backlog.—In anticipation of the rush for coach business, United States carriers had at the close of 1951 a substantial amount of new equipment on order for early delivery. Although about 95% of the U.S. aircraft manufacturing industry's efforts during 1951 was devoted to military production, the demand for modern air transports increased unfilled orders at the end of the year to more than 500 units, representing an all-time high for the industry. Lockheed Aircraft Corp., for example, reported 75 orders for its new L-1049 Super Constellation, which was certificated late in 1951 and had space for up to 93 first-class passengers or 110 coach fares. Late in Dec. 1951, Douglas Aircraft Company, Inc., announced that American Airlines, Inc., had contracted for 25 DC-7 aeroplanes, a new version of the Douglas DC-6B, powered with four Wright Turbo Compound engines rated at 3,250 h.p. each and cruising at 363 m.p.h., with 60 passengers in standard seating or 95 in coach service. Fuel consumption of the compounded R-3350 Turbo-Cyclone engine was 0.39 lb. per brake horsepower, which was virtually half that of existing turboprop engines and about 20% below that of conventional piston engines. Progress on the new twin-engined transport types, the Martin 404 and the Convair 340, was also proceeding on schedule and both were expected to be in service in 1952.

Production of other commercial types, light utility, agricultural and business planes, was seriously affected by material shortages and by military demands during 1951, about 2,300 light planes being built, compared with 3,400 in 1950. This was the lowest ebb since World War II, but it at least resulted in demand exceeding supply for the first time since the immediate postwar period.

The safety record of the scheduled carriers approximated that of the preceding year; *i.e.*, 1.3 passenger fatalities per 100,000,000 passenger-miles. That of the "nonskeds," or irregular carriers, however, which had been outstanding for many months, was marred by a series of C-46 accidents in the closing weeks of the year.

Following lengthy hearings before the committee on interstate and foreign commerce of the U.S. senate, the Civil Aeronautics board established an administrative separation of service-mail pay from subsidy-mail pay. For the fiscal year 1951 the board estimated that a subsidy of $34,565,000 had been included in the total domestic mail pay of $61,934,000 for that period. It was the board's belief that by 1953 the subsidy would decline to about 30% of the total mail pay for that year.



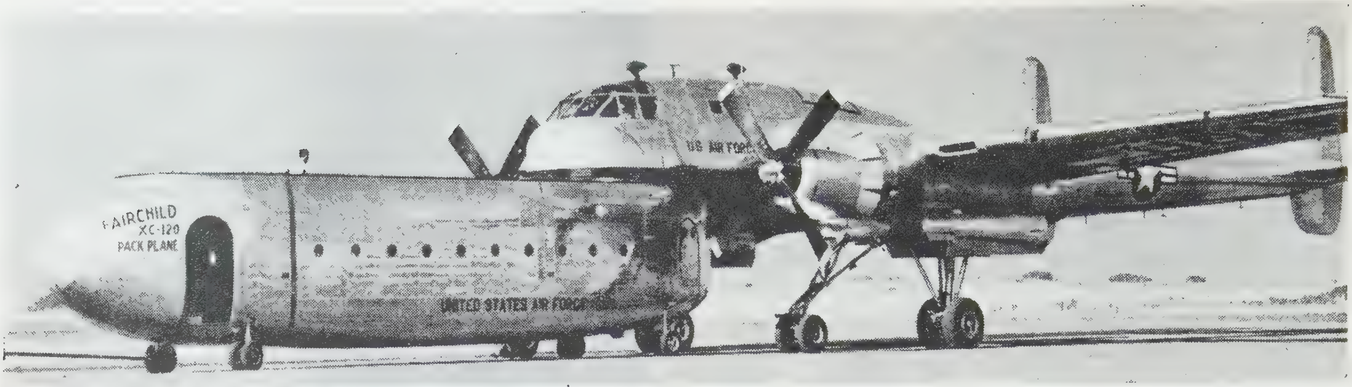
THE LOCKHEED SUPER CONSTELLATION (foreground), first flown in 1951, pictured beside an earlier Lockheed transport. The new air liner accommodated from 54 to 88 passengers, at speeds up to 374 m.p.h.

On Dec. 17, 1951, Secretary of Defense Robert A. Lovett and Secretary of Commerce Charles Sawyer jointly announced a plan for the establishment of a civil reserve air fleet, consisting of several hundred of the four-engined aircraft, with their crews, normally engaged in commercial air transport service. This was the first time that a co-ordinated plan for the mobilization of the civil air industry had been worked out in advance, providing for a sound balance between essential civilian and strategic military air transport requirements.

I.C.A.O. Meetings in South America.—Two important meetings of the International Civil Aviation organization were held in South America during the year. The second Regional Air Navigation meeting convened in Buenos Aires, Arg., in Oct. 1951. It made substantial progress in planning for standard facilities and practices for such aids to air navigation as airports, communications, meteorology and traffic control.

Elimination of red tape for passengers, baggage and aeroplane crews was the objective of the Facilitation conference which met in Buenos Aires in Nov. and Dec. 1951. The conference recommended simplification of international procedures, comparable with those used in domestic services, and the elimination of passenger manifests, consular visas for goods and particularly of transit visas.

Throughout Latin America both domestic and international trunk air routes continued to furnish highly important service for passengers, cargo and mail in an area characterized by formidable geographical obstacles and limited surface transport facilities. Improvements of the Manáos (Brazil) airport on the Amazon river, scheduled for completion during 1952, would permit some major changes in international trunk routes bisecting the South American continent. Other airport improve-



FAIRCHILD XC-120 Pack Plane, which completed flight testing in 1951. Featuring a detachable pod, it could get into relatively small fields, detach its cargo pod and fly away for another loaded pack

ments of international interest were scheduled in 1952 for Quito and Guayaquil in Ecuador. Statistics from Brazil shown in Table III are indicative of the growth of air transportation throughout the American republics. (*See* also Aircraft Manufacture; Aviation, Military; Civil Aeronautics Administration; Jet Propulsion; Petroleum.) (J. P. V. Z.)

Table III.—*Air Traffic in Brazil*

(In millions)

Year	Kilometres flown	Passengers carried	Cargo (kilograms)
1950	91.0	1.7	44.0
1949	72.0	1.3	33.5
1948	69.7	1.1	22.4
1947	54.6	0.8	12.3

Great Britain, Commonwealth and Europe.—Traffic on most air lines was good in 1951 but was accompanied by higher operating costs. Few operating companies made a profit, yet most reported smaller losses and some were evidently approaching a period of prosperity. On a number of routes, fares were increased to meet higher costs and plans were in hand to develop tourist or third-class travel by fitting aircraft with more seats. This plan had already been adopted by Air France on routes between France and French North Africa, as distinct from the method of reducing fares at "off" seasons and in "off-peak" hours. As Air France, alone among the chief European operators, made a profit in 1950, third-class air travel seemed worthy of careful examination.

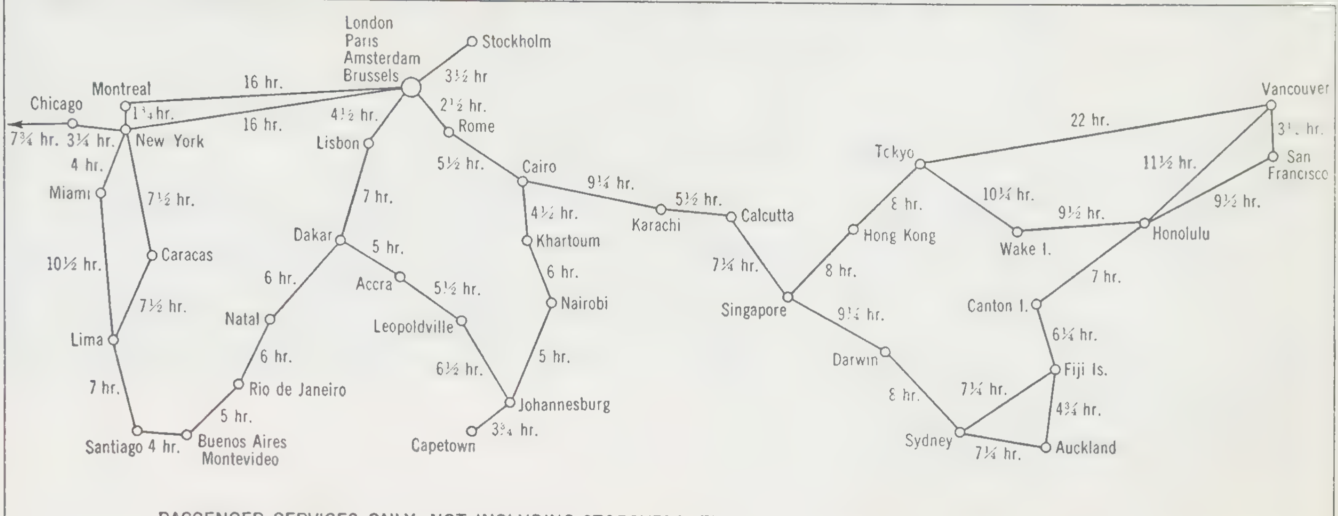
In preparation for tourist traffic, Scandinavian Air services was arranging to fit at need into its Atlantic DC6s 80 seats instead of the normal 69. British Overseas Airways corporation (B.O.A.C.), reluctant to embark on this project until its Comets were in service, was nevertheless contemplating an optional increase in Constellation seats from 43 to 68. Royal Dutch Airlines (K.L.M.), in ordering new Constellations, arranged to have the seats set on rails so that they could be differently spaced for first-, second- and third-class services. Schedules of tourist fares had not been announced at the end of the year, but certain U.S. operators forecast a saving of more than 30% on the return fare between New York city and London or Paris. The expectation was of an average saving of 20% to 25%. Some experience of this type of traffic had already been gained by private charter companies and tourist agencies in transporting holiday parties and groups of emigrants. Given full loads, it had yielded remarkably low fares. The secret was seen to lie in obtaining full or nearly full loads instead of computing fares on a basis of filling 65% of available capacity.

The threat of competition had to be met in one way and another by the big operators throughout the year. South African Airways sought to have K.L.M.'s services between Amsterdam and Johannesburg reduced from two to one a week, but failed. On the London-New York run, British, French and U.S. operators vied with one another in offering luxurious travel. K.L.M.'s contribution to the summer attractions on the Atlantic route was an all-sleeper service with 30 berths instead of the customary 43 seats in its Constellations.

In these efforts was reflected the desire to continue the improvement shown in the previous year's accounts. B.O.A.C. in 1950–51 had reduced its deficit by £3,250,000 but was still left with a loss of £4,500,000. The loss of the British European Airways corporation (B.E.A.) was reduced by 28% and stood at £979,267. K.L.M.'s deficit of £3,500,000 in 1949–50 was brought down to about £1,000,000. Sabena, which had lost £636,800 the previous year, was reported as breaking even. Swissair, with more traffic, still suffered a loss largely through the effects of devaluation. Scandinavian Air services too had a deficit. The only profit was earned by Air France and that amounted to £10,500. There were profits for some of the smaller companies. Aer Lingus showed a profit of £14,646; Cyprus Air Lines made £17,478 and Iberia, the Spanish company, made £258,212. All the evidence pointed to the willingness of the public to make increasing use of the air services and to the difficulty on the part of the operators in preventing increased revenue from being defeated by increased costs. K.L.M. with 16,000 more passengers, 3,700 tons more of freight and revenue up by 44% still lost money. B.O.A.C., flying 26% more passenger-miles, having revenue increased by £4,750,000 and staff reduced by 1,340 in the year, still showed a large deficit, though with still further improved traffic in the first half of the year 1951–52 it made a profit of £113,000. B.E.A.'s traffic in 1950–51 was so much improved that revenue advanced by 30%, but operating expenditure increased by 20.9%. B.E.A. also showed a profit of £243,000 in the first half of the year 1951–52.

In preparing for the future, few operators were ready to embark straight away on the use of jet or turboprop aircraft. B.O.A.C. remained fully committed to the use of the Comet jet liner from 1952 on main routes where stage lengths up to about 1,500 mi. were normal and it looked for the first deliveries of the turboprop Bristol 175 liners about a year later. It had also ordered some of the later Comets which, with Rolls-Royce Avon engines, were estimated as suitable for 2,000-mi. stages while carrying the same pay load of 14,000 lb. The first of these was expected during 1953. Orders for this make of Comet were placed by Panair do Brasil. Two of the earlier Comets were still on order for Canadian Pacific Airlines. Intended originally for the arctic route between Vancouver and Tokyo, these were now said to be planned for use on those stages of the company's route to Australia which lie south of Honolulu. Air France, too, showed much interest in the Comet; it raised its order for Viscount turboprop liners from 5 to 12. B.E.A. began acquiring experience with turboprops by fitting two of its freighter Dakotas with Dart engines similar to those used in the

WORLD AIR DISTANCES IN HOURS, 1951



PASSENGER SERVICES ONLY, NOT INCLUDING STOPOVERS. TIME SHOWN IS FOR FASTEST SCHEDULED FLIGHTS

Viscount, 22 of which it had on order. First impressions of this turboprop in heavy service were extremely good.

Beyond this, active interest in the gas turbine for commercial purposes did not go in 1951, although anxiety among some U.S. operators lest they should find jet competition hard to meet was evident. In Europe the general tendency was to stick to established types. K.L.M. boldly declared its lack of faith by ordering five of the new Constellation 1049Cs and taking an option on four more. Sabena added two more Convair liners to its fleet, making a total of eight. Most of the other principal companies continued to rely on Constellations, DC-4s and DC-6s.

This disinclination to abandon the piston engine rested almost wholly on fears of the gas turbine's high fuel consumption, particularly at low levels. Operators foresaw serious difficulties, especially in European winter weather, if gas turbine aircraft were kept waiting to land, and were not persuaded that traffic patterns at the approaches to busy airports could be sufficiently adjusted to diminish delays. British authorities, after nearly two years of flight by the Comet along the principal European routes, acknowledged the need for careful organization but did not share the general scepticism concerning the prospect of an early solution.

B.O.A.C., after a full eight months of route survey flying with the Comet on the runs to Johannesburg and Singapore, was equally hopeful of control modifications sufficient to meet the Comet's high speed and critical endurance limitations at airport approaches.

In the face of all doubts and disbelief B.O.A.C. was preparing to put Comets on the run to Cairo early in 1952, and to extend their service subsequently, first southward through Africa to Johannesburg and later eastward through Pakistan and India to Singapore and ultimately to Australia. It had plans also for starting late in 1952 a Comet service between New York and Bermuda and afterward between New York and Nassau. Confidence in these prospects led the corporation to begin trimming its fleet. It sold 23 Yorks and 4 Hermes IVs and declared a fifth surplus to requirements. It finally declined the three 140-ton Princess flying boats which were being built for it, and these were promised to the R.A.F. for troop carrying. Meanwhile, B.E.A., which had expected to have the use of its Ambassador aircraft to help with the heavy summer traffic, was still without them at the end of the year, mainly because of modifications to reduce the drag of the engine cooling system and to improve radio reception. There was some delay, too, in the conversion of 26 Dakotas into Pionairs with four extra passenger seats and a crew of two instead of three. Nevertheless the corporation contrived to carry 1,000,000 passengers in the year and to become the first operating company outside the United States to do so.

All lines working between Europe and the far east in the second half of the year were at some disadvantage through the cessation of fuel supplies from Abadan. The effect was to restrict the fuel available at places east of Iran. B.O.A.C. cancelled for a time its freight services between London and Singapore. No passenger service was abandoned but charter flights to the far east became impossible. In consequence the movement of goods by air to the far east was subject to delays; congestion was increased by the heavy loads of Christmas traffic and mails and delay at one time amounted to more than a month.

In November B.O.A.C. restored one of its freight services to Singapore.

British helicopter services were continued throughout the year. The original passenger service between Liverpool and Cardiff was discontinued and a new one, over 95 mi., between London and Birmingham was started. (E. C. Sd.)

Aviation, Military.

United States Air Force.—During the year 1951 the U.S. air force made considerable progress toward the goal of attaining, by the end of fiscal year 1952, a modernized 95-wing air force with the necessary supporting units. In November an acceleration of this expansion appeared in prospect when Pres. Harry S. Truman and the national security council approved recommendations of the joint chiefs of staff that an air force of 143 wings (including 126 combat wings) be achieved during 1954.

Approximately 150,000 individuals ordered into active military service from the reserve forces were absorbed into the air force with a minimum of indoctrination and training. In October the air force announced a revised, long-range program for the training and recall of reserve forces. The new program provided for technical training of air force reserve personnel by civilian schools under government contract and the complete integration of the reserve organization, its administration, training and supply, with the regular establishment.

The number of air force R.O.T.C. units was increased from 125 to 187. The training program at air force bases for foreign military personnel under the Mutual Defense Assistance program was greatly expanded. The air defense command assisted in recruiting and training approximately 112,225 civilian volunteer members of the ground observers corps, an adjunct of the Aircraft Warning and Control system (radar screen to detect approaching enemy aircraft) the near completion of which was announced in Oct. 1951.

The installations structure of the air force was re-evaluated in the light of defense and training needs. The increase in personnel required additional and expanded facilities, especially of bases for training. Many World War II bases in the continental United States were not properly located for air defense operations or for strategic counterattack. Construction of new bases, rather than the reactivation of former bases, was necessary in only a few cases, but many facilities had to be modernized at existing bases. Bases in Greenland, England, France and elsewhere were activated or were under construction to support the forces of the North Atlantic Treaty organization.

Procurement of aircraft was programmed to meet operational requirements in Korea and throughout the world and to anticipate future requirements. Contracts for production of the Canberra, the British-designed jet bomber (the first jet aircraft to fly the Atlantic nonstop without refuelling), as a night intruder aircraft (the B-57A) were let in March, and announcement was made of the commencement of ground tests on the B-60, a swept-wing, all-jet version of the B-36 bomber. The B-52, a new all-jet, long-range strategic bomber, was ordered into production. There was a step-up in production of the F-89 (Scorpion) twin-engine, all-weather night fighter and the B-47 Stratojet, a six-jet medium bomber.

The year saw development in such fields as air transport, the convertiplane, jet engines, guided missiles, swept-wing aircraft and rocket-assist take-off. Announcement was made in February of a contract for the development of the first nuclear propulsion unit for aircraft, and in September a contract was let for the building of the first atomic-powered airframe. (*See* also Atomic Energy.)

The Air Pictorial service was established in March to handle all photographic activities of the air force except combat photography. On Sept. 19 President Truman signed the Air Force Organization act of 1951 (public law 150), the first detailed organizational legislation affecting the air force, and an act that established by law the three major commands of the air force.

The 1st pilotless bomber squadron (light) was activated on Oct. 1 at the U.S.A.F. missile test centre, Cocoa, Fla. This unit, equipped with the B-61 pilotless bomber (the Matador), was the first unit of its kind in the air force.

Increased attention was given to the recruitment of women in the air force, with a new personnel goal of 48,000 set. In March the first woman physician to be commissioned in the air force medical service was sworn in as a captain.

While support of the United Nations forces in Korea was given priority in air force operations during the year, increased support was given Gen. Dwight D. Eisenhower's North Atlantic Treaty organization (NATO) force. In May the 3rd air division (formerly an independent command with headquarters in England) became the 3rd air force and was made a part of the United States air forces in Europe (U.S.A.F.E.) under Lieut. Gen. Lauris Norstad, who also commanded the central European components of the U.S. and Allied air power assigned to Supreme Headquarters Allied Powers in Europe (SHAPE).

In mid-January six B-36s flown from Carswell air force base, Tex., via Limestone, Me., to Lakenheath, Eng., and nonstop from England to Texas on a routine training mission, were the first B-36s to appear in Europe. On May 7 a small number of air force personnel arrived in Iceland to help strengthen the defenses of that country. The 433rd troop carrier wing, an Ohio air reserve unit activated in Oct. 1950 and flying C-119s, became the first air force combat unit to be permanently assigned in Europe since World War II and the first United States air unit specifically assigned to NATO. It arrived at Rhein-Main air base on July 29. The first unit of the 81st fighter interceptor wing, a squadron of F-86s, arrived in England in August, the first foreign air unit to become an integral part of the United Kingdom's air defense. The 126th bomb wing (B-26), a former air national guard wing with units from Illinois and Missouri, activated in April, was transferred to France, to be based at Bordeaux-Merignac aerodrome, the first U.S. combat force based in France since World War II.

Problems relating to the tactical support of ground forces were investigated during Exercise "Southern Pine," held in August in North Carolina. This joint manoeuvre involving both army and air force personnel (including W.A.F.) was concerned with establishing and holding an air head. The exercise involved participation by the 9th air force and major elements of the 18th air force, and gave operational training to two army divisions about to be transferred to Europe. In October the air force participated with the army and navy in Exercise "Desert Rock," atomic warfare training in connection with tests of nuclear weapons at Frenchman's Flat, Nev.

In Korea, aircraft under the operational control of the far east air forces flew a total of 336,063 sorties through Nov. 27, 1951. During the same time, 354 aircraft of all types were lost to enemy fire.

The U.S. far east air force flew approximately 615 sorties daily in support of ground action—most of them against ground targets from below 500 ft. altitude in the face of heavy automatic weapons fire. U.S. heavy bombers dropped tons of propaganda leaflets over enemy territory, and night bombing attacks increased steadily. Radar aiming techniques were improved to where the night attacks attained accuracy comparable to visual aiming methods. Particularly successful were the employment of B-26s against rolling stock and vehicles, and the B-29 strikes against Communist airfields. From August to mid-December, Operation "Strangle" exploited the dependence of the Chinese upon supplies from China and the U.S.S.R. U.S. air attacks destroyed great quantities of Communist equipment: 67,850 vehicles, 1,236 locomotives, 23,500 railroad cars and 1,820 tanks were destroyed or damaged. The Communists suffered an estimated 138,388 casualties caused directly by air action.

The air force F-80 (Shooting Star), the faster F-84 (Thunderjet) and the still faster F-86 (Sabre jet) performed well against

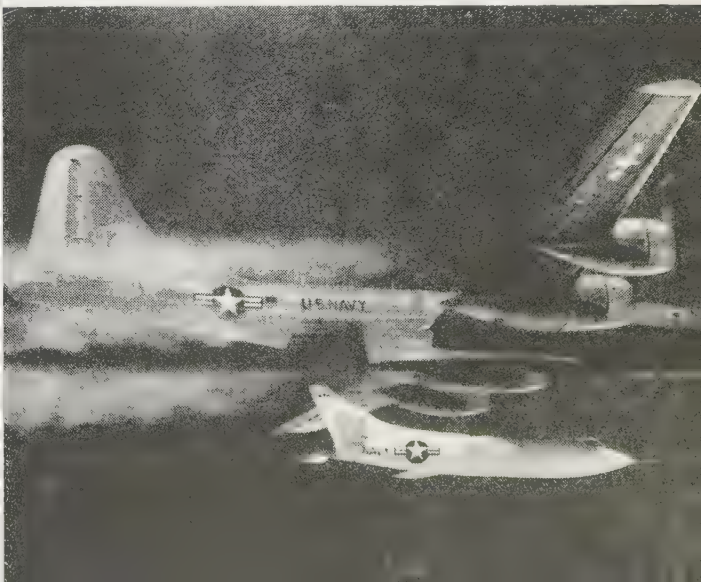
Below: DOUGLAS D-558-2 SKYROCKET (bottom) being launched from a B-29. An experimental rocket-powered plane, it set world records in June 1951 for speed (1,300 m.p.h.) and altitude (70,000 ft.)



the soviet-built MIG-15, an aircraft comparable in performance to the U.S. F-86, employed by the Communist forces, but a careful assessment of combat air action in Korea indicated that the real superiority of United Nations air forces over Communist air forces was in fire-control equipment and in the training and skill of U.N. pilots.

From Nov. 1, 1950, when the MIG-15 first made its appearance, through Nov. 28, 1951, the day of the provisional cease-fire, the U.S.A.F. lost 26 jet aircraft to enemy air-to-air action. During the same period it destroyed 152 Communist jets and probably destroyed 51 more—all MIG-15s.

At the beginning of the year, the air force had 560,000 personnel and 58 wings. As of Oct. 31, 1951, the air force had 88 wings and its personnel strength was approximately 840,000, of whom less than 8% were officers. Women numbered approximately 12,000 of the aggregate. The 95-wing air force had a personnel goal of 1,061,000.

Casualty statistics as of Nov. 23, 1951, indicated a total of 305 deaths, and 539 still missing in action, during the 16 months of the Korean war. (*See* also ATOMIC ENERGY.) (H. S. VG.)

United States Navy.—Naval aviation continued throughout the year to support United Nations forces in Korea. A fast carrier force generally including three carriers operated in the Sea of Japan; a support force composed of light and escort carriers with marine squadrons aboard operated from the Yellow sea; marine corps aviation units, including two all-weather squadrons, operated from land bases under the U.N. far east air forces; and patrol squadrons with both land and seaplane types operated from Japan and Okinawa and from tenders in the Pescadores Islands.

The combat operations of naval aviation forces were all in support of the ground campaign and therefore varied with the ground situation. In January, when United Nations forces were deploying to defensive positions below the 38th parallel, emphasis was on support of troops at the battle line. When red forces were stopped and United Nations forces began their slow but steady advance northward, naval and marine aircraft shifted the weight of their attack to interdiction. By scheduling alternate replenishment periods for individual ships, continuous air operations were conducted with only a few days in port each month for rest and recreation. Fast carrier aircraft attacked targets over the entire peninsula, but their main effort was in the east and northeast sectors. By attacks on enemy supply arteries in these areas, carrier aircraft reduced enemy movement and made it increasingly difficult for the enemy to support troops committed to battle.

In terms of World War II experience, the total naval aviation force was small, but its achievement in some respects surpassed the efforts of that conflict. The sortie rate, for example, was higher, the combat employment of carriers was on a more continuous basis, and the ordnance expenditure not only exceeded the per flight delivery but force expenditure rate was also higher. For the first time, naval aircraft continuously supported a large army in an extended campaign over a relatively large land mass.

From the opening of hostilities in June 1950 through Oct. 1951, naval and marine aviation forces flew more than 110,000 sorties in the combat theatre. In addition to defensive missions, reconnaissance patrols and a small percentage of noncombat flights, 69,200 sorties were offensive in purpose. In close air support alone, 34,800 sorties put aircraft over the battle line for 33,300 hours in which time they made 229,700 bombing, rocket and strafing runs on specified targets. U.S. naval and marine aircraft contributed approximately one-third of U.N. combat sorties in Korea.

These combat operations required logistic support. In the immediate area, the at-sea replenishment group furnished aircraft, fuel, ammunition and other supplies to ships of the carrier forces. Shore bases in Korea, Japan and on Okinawa supported patrol and land-based marine squadron operations and housed maintenance and service units.

Facilities at Yokosuka and Sasebo provided replenishment and repair services to the ships in port.

The requirements of Korean operations gave impetus to development programs and caused an expansion of the entire naval establishment. Since June 1950, 42 squadrons of the organized reserve had been recalled to active duty. During 1951 the number of aircraft in operating status increased by 500, officers and men in the aeronautical organization rose to 137,000 and the flight training program was enlarged to produce 1,800 pilots per year. The reactivation of aviation ships brought the number of operating carriers to 27, of which 3 were "Midway"-class, 9 "Essex"-class, 5 light and 10 escort types. A contract for the construction of a 59,900-ton flush deck carrier was let in July. For mobile support, two aviation supply and four aviation repair ships were also reactivated.

Helicopter research indicated the possibility of adapting jet engines to this type of craft. Their first use would be in a cargo unloading model, which was already in construction. Tests of guided missile launching from ships were continued. Air-to-air types were also readied for operational evaluation. An experimental aircraft, the Douglas Skyrocket, in breaking all existing speed and altitude records, furnished additional data in high-speed research. The XF4D, a delta-wing carrier jet fighter designed for high-altitude interception, passed its initial flight test. The tactical adaptation of new equipment to anti-submarine warfare and other naval combat functions was under continuous study, particularly in operations co-ordinating air, surface and subsurface forces. (*See* also NAVIES OF THE WORLD.)

(J. H. C.)

U.S.S.R.—Reliable production figures were still entirely lacking in 1951. Guesses as to annual output ranged from 5,000 to 15,000 and for available combat aircraft, up to 20,000. But no one outside the Kremlin really knew. Comfortable theories had been advanced to the effect that although soviet technical skill remained as good as that of any other country, capability to organize production in quantity was still lacking. This was an unfounded and unsafe assumption, however. Many capable German production people disappeared into the U.S.S.R. in 1945—men with a first-hand knowledge of turning out aircraft under the most adverse conditions in wartime. It would be unlikely that the experience they gained would be overlooked by U.S.S.R. planners. Such assistance, coupled with the fact that Russian aircraft manufacturing plants were neither destroyed during World War II nor shut down afterward should give pause to any facile discounting of soviet production potential. Large aircraft, engine and accessory manufacturing centres probably had been built deep in the central Asiatic regions, but their exact location and their production rates were not known.

Information on soviet aircraft, apart from observations made during the Korean war, came largely from reports during annual aircraft parades over Moscow, and from scattered sightings of new planes over the Russian-held zones of western Europe. It was, therefore, fragmentary and had always to be recognized as somewhat out of date when published.

Such observations, also, yielded information only on the general performance. They told nothing of what was inside the shell—what engines were used, or what kind of armament or radio gear was carried. For example, although the existence of the so-called MIG-15 had been reported for at least five years, it was not until one was shot down in Korea in the summer of 1951 that its power plant was identified with any certainty.

It became known that the Russians had combined the best of British and German jet engine practice into efficient designs of their own. They had not been blind copyists, but had made improvements in line with modern design, metallurgical and production techniques. There was no reason to believe that Russian jet engines in use or under development in 1951 were inferior in any way to those on test beds in other parts of the world.

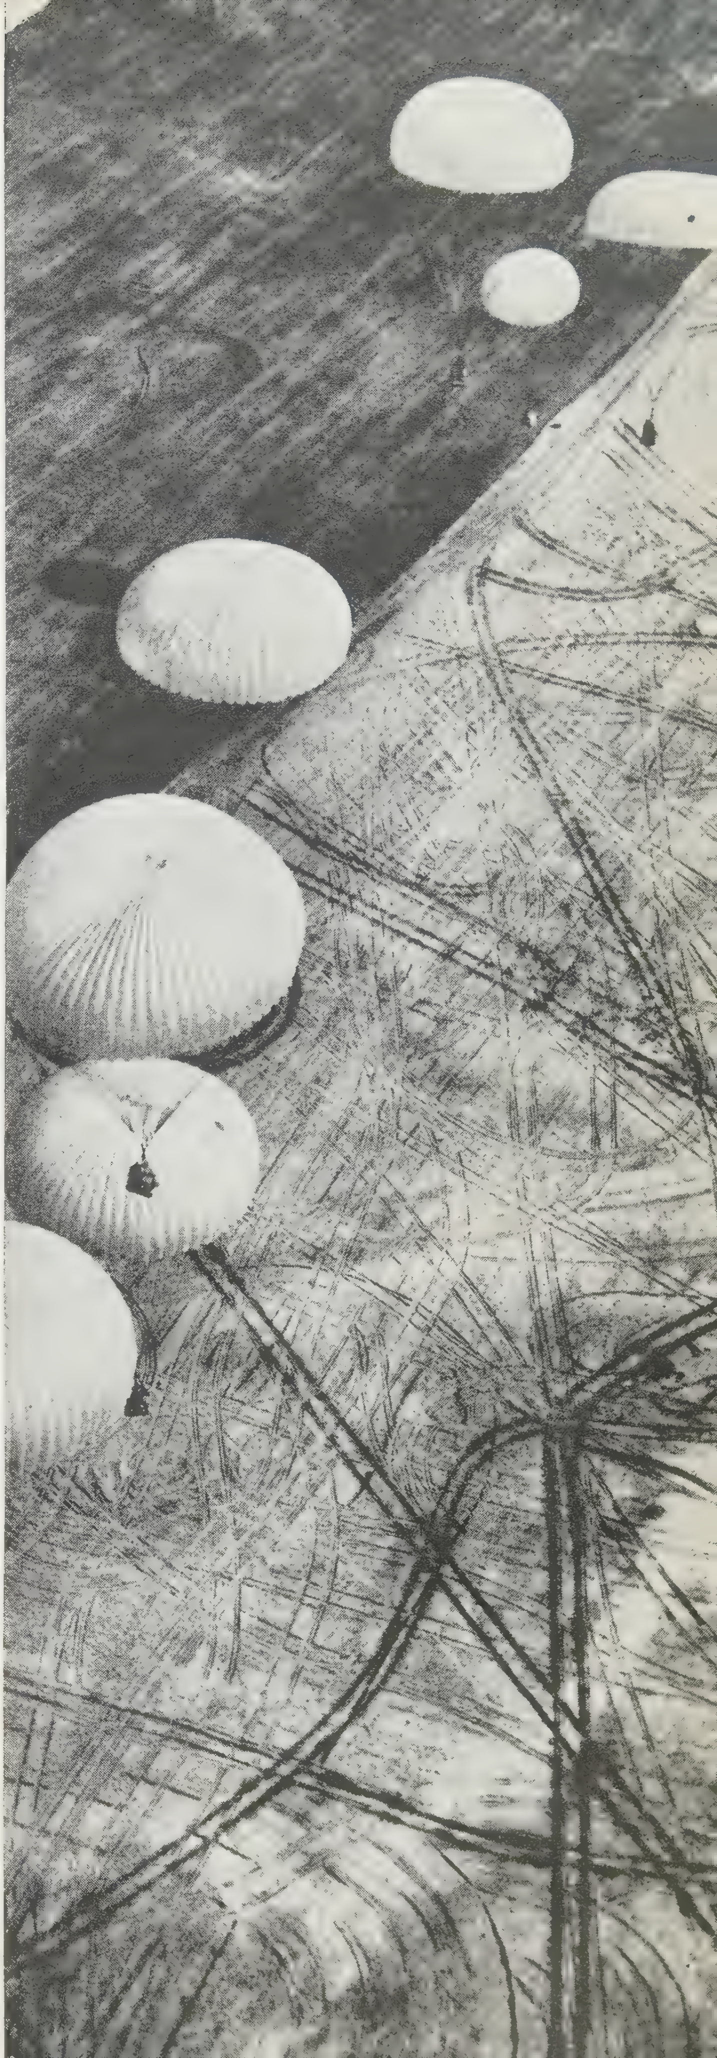
The same could be said of armament. Although the experience of the Korean war had indicated that the larger (37 mm.) calibre, slower-firing aircraft cannon fitted in the MIG's were not as effective for air-to-air jet combat as the U.S. smaller-calibre, higher-firing-rate guns, that lesson had not been lost on the Russians. Meanwhile, the larger cannon were known to be excellent for ground support tactics. The soviets had long been proponents of aircraft rocket ordnance. Their wing-carried rockets were highly developed during World War II, and with the aid of German rocket experts it seemed probable that this form of ordnance had not been neglected. Whether or not they had developed anything new in proximity-type fusing was speculative, but the operating principles of this useful device were so universally well known that its use by the Russians was a practical certainty.

The greatest probable soviet weakness in 1951 lay in the area of application of electronic devices. A modern military aeroplane is little more than an aerodynamically shaped housing around a maze of electronic-actuated control, navigating, gun-aiming and gun-firing gadgets. As speeds and general performance of aircraft go up, the human pilot must rely more and more on "quick-thinking" vacuum tubes and electronic circuits to do his work effectively. U.S. aircraft and missile designers had a vast reservoir of radio technology and a tremendous electronic equipment manufacturing capacity at their beck and call—an asset that seemed almost entirely lacking to the Russians.

Few new aircraft types were identified during 1951. There were rumours of a new swept-wing fighter (tentatively designated as a MIG-17) seen both in Korea and in western Europe, which evidently outperformed the five-year-old MIG-15. Also a tailless type, probably a development of a German Heinkel fighter of 1945, was reported flying in the vicinity of Moscow. Delta-wing designs for very high speeds were well along in German experimental plants before the end of World War II, and it is certain that soviet designers were exploring the possibilities of this type as supersonic interceptor fighters, as were Great Britain and the United States. Power plants for such machines would undoubtedly consist of combinations of rocket motors and ramjets.

In the bomber field no startling developments came to light in 1951. There were rumours of a large long-range intercontinental type similar to the U.S. B-36, but no confirmation from sightings or other sources. Meanwhile the TU-71, a soviet adaptation of the B-29, continued to be the basic heavy bomber. These machines could carry an atomic bomb on one-way missions to many key cities of the United States.

More detailed information on the configuration and characteristics of the TU-10 medium twin-jet bomber came to light during 1951. This machine carried a crew of three. It could be adapted to a wide range of tactical and training uses with easy modifications of its armament and equipment. It was thoroughly modern in design and construction. Its two jet power plants, believed to be 6,000-lb.-thrust soviet versions of the British Rolls-Royce Nene engine, gave the TU-10 a probable top speed of about 580 m.p.h.



PARACHUTE DROP of seven 2,500-lb. bundles calculated to supply a U.S. battalion for a day

From the standpoint of aircraft design and production, none of the soviet satellite states was thought to be active in 1951. Certain research centres outside the U.S.S.R. (*e.g.*, the rocket and guided missile testing station at Peenemunde, Ger.) were being used, but under soviet control. There were apparently scattered manufacturing plants building Russian-designed aircraft in the soviet zone of Germany and in eastern Europe, but, as was illustrated by the capture of a U.S.A.F. C-47 transport in Hungary, and by the experience in air fighting in Korea, the Soviet Union's satellites were being supplied with Russian aircraft probably flown by Russian military pilots.

Great Britain and the Commonwealth.—Although British aircraft production fell to a low ebb in the five years following World War II, research and development programs, particularly in the field of high-speed jet aircraft, were maintained at reasonable levels and in 1951 were beginning to bear fruit in the form of fast fighter and bomber prototypes.

Prototypes of Great Britain's first four-engined jet bombers were flown in public at the Farnborough show in September. The Vickers Valiant was a swept-wing machine powered with four Rolls-Royce Avon jet engines completely housed in the wing root. The Short brothers SA/4 was a large monoplane with a pair of Avon engines, mounted one above the other and fitted into a single nacelle mounted on each wing.

The word "prototype" is significant because the important new British aircraft were for the most part just that. Production in quantity was still several years away. Meanwhile, the old post-World War II standbys, the Vickers Vampires and Venoms and the Gloucester Meteors, continued to form the backbone of the R.A.F. fighter command. These jet fighters were also being produced for several nations, including France, Belgium, the Netherlands and the Scandinavian countries.

During 1951 Armstrong Whitworth put a new two-place twin-jet night fighter into production, the MF-11. A development from the Gloucester Meteor, it was fitted with Rolls-Royce Derwent engines. It was said to be very fast and capable of a variety of missions at night and in foul weather.

On the bomber side, the English Electric Canberra in the medium twin-jet category went into limited production and the first of the jet bomber squadrons using these machines was put into commission by the R.A.F. The Canberra was also licensed for production in the U.S. by the Glenn L. Martin company of Baltimore, Md.

HELICOPTER AMBULANCE just after landing a wounded U.S. soldier in Japan for emergency treatment in 1951. Front-line use of helicopters became increasingly important during the year, not only for medical evacuation but for the landing of troops and equipment and for reconnaissance work

For the royal navy production types included the Hawker Fury jet fighter, the Vickers Swift swept-wing jet fighter, the Westland Wyvern torpedo carrier and the Fairey Gannet, a turboprop anti-submarine aircraft. The jet-powered Saunders-Roe seaplane fighter Saro-SR/A1 was subjected to extensive testing in 1951 but was not yet in production.

The first of the Saunders-Roe Princess-class flying boats of 140 tons gross weight was being readied for flight tests at the end of 1951. Three of these large eight-engined flying boats were under construction. Originally intended for commercial use, it was believed they would be diverted to the military for long-range transport of troops. A larger Duchess class was in design stages.

Most interesting of the British types flown during 1951 was a group of research aircraft intended for the study of flight at supersonic speeds. None of these machines had any immediate military value but they forecast the trends in combat designs. Three, the Fairey FD-1, the Avro 707 and the Boulton Paul P-111, were of the so-called delta-wing configuration, resembling somewhat the paper darts made by schoolboys. (The U.S. and probably the U.S.S.R. were also working on research machines of the same type.)

During 1951 British jet engine development continued at a high level. No new types were announced but work progressed toward the attainment of high thrust and greater reliability. A number of engines that were considered experimental in 1950 were put into production in 1951; for example, the Rolls-Royce Avon was now specified for two R.A.F. fighters and two bombers, and plans for putting it into production in at least seven factories in England were being pushed at the end of 1951. The latest Derwent (the Mark 8) was also high on the Rolls-Royce production schedule.

De Havilland's Goblin and Ghost fighter engines were being widely used. The latest Goblin 35 had a rated sea-level thrust of 3,500 lb., the larger Ghost (5,000 lb. sea-level thrust) was fitted in a number of current R.A.F. and R.N. fighters, and the M-50 model powered the de Havilland Comet transport.

The Armstrong Siddeley Sapphire, with more than 7,500 lb. sea-level thrust, was one of the largest British jets. During 1951 the Wright-Aeronautical corporation of Wood-Ridge, N.J., was licensed to build this engine in the U.S.

In the so-called turboprop field (a conventional gas turbine driving a conventional propeller), two engines added considerable military significance in 1951, particularly for the R.N. The first was the Armstrong Siddeley Double Mamba fitted in the Fairey Gannet. It consisted of two Mamba turboprop engines mounted side by side, connected to a common gearbox and driving two separate four-bladed propellers on coaxial shafts. The other was the Armstrong Siddeley Python used in the Westland Wyvern torpedo carrier. This engine was rated at more than 3,500 shaft h.p. plus 11,000 lb. direct thrust at sea level.

Although active development on all types of piston engines had ceased in Great Britain, a number of older models were still in production for propeller-driven bombers and trainers. Among them, Rolls-Royce Merlins and Griffons were of Battle of Britain fame. One innovation was revealed by Napier in the form of a compound engine consisting of a piston engine with direct connected exhaust-driven turbine, but its application was as yet unannounced. It was rated at 3,000 shaft h.p. plus 320-lb. thrust.

In addition to the conventional types mentioned above, a great deal of work was known to be going forward in Great

Britain on rocket engines, both for supersonic aircraft and for guided missiles. The only public announcement in this field, however, concerned the Armstrong Siddeley Snarler, a 2,000-lb.-thrust liquid-fuel rocket unit which was demonstrated as an assisted take-off device on the Hawker P-1040 experimental jet fighter.

The commonwealth countries contributed little to British air power in 1951. Canada was in the lead with a two-place, long-range, twin-jet all-weather fighter, the Avro CF-100 Canuck. The power plant was to be the Canadian-built Avro Orenda jet engine. The prototype was flown in 1950, and limited production began in 1951. Canadair Ltd. of Montreal (a subsidiary of the U.S.-owned Electric Boat company) began quantity production on the North American (U.S.) Sabre jet fighter during the year.

In Australia, activities were limited to the development of jet-powered target drones, expendable radio-controlled aircraft for gunnery practice. It was known also that test flying had been initiated in the rocket testing ground at Woomera in South Australia. Several British guided missile manufacturers started test programs at Woomera.

Other Countries.—It was significant that tabulations of the air strength of the North Atlantic organization countries in 1951 showed that practically all the fighting squadrons that could be put into action immediately were made up of aircraft of British or U.S. origin. The sole exception was Sweden, which listed a couple of jet fighters of Swedish design and construction. France, once the top air power of the world, with an extensive manufacturing industry, had nothing to offer but a scattering of prototypes of only average capability for military use.

Below, listed in alphabetical order by country, are notes on the status of military aviation in areas of any significance in the world air power picture of 1951.

Argentina.—Argentina was the only country in South America where any military aircraft of modern design had been built, probably because of the presence of certain former French and German designers such as Kurt Tank and Amelio Dewoitine. The former was responsible for a high-performance, single-seat, swept-wing fighter, the I.Ae.33 Pulqúi II, powered with a British Rolls-Royce Nene jet engine. Dewoitine designed the I.Ae.27 Pulqúi I, also a Nene-powered jet fighter of less advanced type. This work was conducted at the Instituto Aerotecnico at Córdoba, a government-owned establishment. It was said to be the largest aircraft manufacturing plant in South America with a reported employment of more than 6,000 people.

Denmark.—This country was reported planning a 15,000-man air force by 1954, but had to rely on other countries to supply the necessary aircraft. During 1951 a certain amount of underground airbase construction was rumored.

France.—The 19th *Salon de l'Aéronautique* held in Paris in the summer of 1951 revealed that the five-year rearmament plan for the French air force introduced by the secretary of state for air André Maroselli in 1947 was progressing, but slowly. On the civil side, a number of transport, cargo and general utility types turned up, but the results for the military were disappointing. The only production was in British de Havilland Vampire, Mark 5s with British engines, and in Dassault MD-450 Ouragans. The latter was a strictly French design of excellent performance. It was powered with Hispano-built Nene engines. A later Dassault jet fighter, the Mystere, was flown in prototype and was reported to show great promise, from the standpoints of both performance and production. First models of the Mystere were flown with British-designed, French-built Rolls-Royce Nene and Tay engines, but production machines were expected to be fitted with a French jet engine, the Atar, designed and built by Gnome-Rhône of Paris. At least three other jet fighter prototypes were tested during 1951, but their performance and production programs were still unknown. Two twin-jet fighter bombers of advanced design, the Société Nationale de Constructions Aéronautiques de Sud-Ouest 4000 and the S.N.C.A. de Sud-Est Grognard I, were test flown, but would probably not figure in production programs for some time.

French aeronautical research and development remained under the direction of the Office National d'Etudes et des Recherches Aéronautiques (O.N.E.R.A.), with technical headquarters at Châtillon and principal test stations at Chalais-Meudon and at Modane in the French Alps. At the latter, large supersonic wind tunnels had been installed and were scheduled to go into operation late in 1951. The French aircraft industry was still suffering from the physical disruption of the German occupation and the political disruption engendered by partial nationalization. Several years more would probably be required before satisfactory solutions of either of these problems could be found.

Italy.—The Italian aircraft industry, almost totally destroyed during World War II, showed signs of revival in 1951. A few light transports and sport types had been built, with only one design of military significance, the Fiat two-seat jet fighter, G-80. A single-seat version was also reported. The G-80 was the work of G. Gabrielli, a well-known Fiat designer.

Sweden.—Sweden's air force probably ranked as the fourth most powerful in the world in 1951, topped only by those of the United States, Great Britain and the U.S.S.R. It was reported to include more than 50 combat squadrons, with a high proportion of jets. The program called for an all-jet fighter force within two years. Although both U.S. and British aircraft were now used, an increasing number of Swedish-designed and built machines were coming off production lines. The J-29 was the current production model. It was a single-seat jet fighter of excellent performance powered with a Swedish-built Rolls-Royce Nene engine. A later model, probably the J-1001, was reported in production, but details were lacking. It was significant that Sweden in 1951 was the only country (outside the U.S.S.R.) where large aircraft manufacturing and servicing plants had been put underground. Bacteriology.

In the unceasing effort to conquer disease, recent events had promised new weapons and a new methodology in the field of medical microbiology. One new agent isolated, Protaptin, was an antibiotic produced by a bacterium trained specifically for the task of destroying the bacillus of tuberculosis. The antibiotic was obtained by cultivating a bacterium of the genus *Proteus* in a meat broth containing dead tubercle bacilli. By gradually eliminating the meat,

U.S. PUBLIC HEALTH technicians sampling air 20 ft. above street level for a bacteria count, as part of 1951 defense work against possible bacteriological warfare. Detection equipment included a new waferlike filter permitting bacteria to be identified within 15 hrs.

the bacterium became adapted to a diet exclusively of tuberculosis organisms, and produced a substance capable of destroying virulent tubercle bacilli, yet which was harmless to experimental animals. Years elapsed before the pure antibiotic was successfully isolated, and by the close of the year 1951 it was believed that the ultimate value of this drug might soon be demonstrated when its performance in clinical trials was evaluated. Perhaps a greater import might be ascribed, however, to the illustration of a new method which, it was thought, would immeasurably increase the scope of microbiology, namely, growing "killer" microbes selected and adapted for a role of antagonist to a specific pathogen.

Another instance of the therapeutic value of bacterial metabolic products was the usage of streptokinase and streptodornase to treat postpneumonic empyema. These two substances, which destroy fibrin and desoxyribose nucleoprotein respectively, are produced by streptococci. They had been tried in some clinical cases with good results. Although streptokinase and streptodornase are not bacteriostatic or bactericidal per se, they remove the barrier between humoral and cellular elements and allow the body's defenders, such as phagocytes, to contact and destroy the pathogens previously protected by pus and exudates. In a like manner, concurrent use of antibiotics is enhanced since the obstructive film of exudate is dissolved, permitting intimate contact between microorganism and antibiotic.

Constant improvements in existing therapeuticals are necessary to increase efficacy, or even to maintain usefulness of the drug as more and more drug-fast and antibiotic-resistant strains develop. The ability of penicillin to penetrate scar tissue and to exterminate the organisms protected by it was increased by the addition of iodine to the antibiotic. This product was reported to have penetrated scar tissue in the lung in cases involving lung abscess, chronic bronchitis and other chronic lung conditions where penicillin had normally been ineffective.

Botulism from Wounds.—Botulism, most deadly of the food-borne intoxications, was reported to have occurred as the result of wounds. Two patients, one a 13-yr.-old boy with a minor gunshot wound, the other a victim of a handsaw cut, died with symptoms of botulism. These deaths reopened the question of the pathogenicity of *Clostridium botulinum*, which had long been credited with being capable of intoxication only *per os*.

Coxsackie Virus.—In 1947 a virus isolated during a polio epidemic in Coxsackie, N.Y., was found to be the aetiological agent for a disease symptomatically similar to but milder than poliomyelitis. The agent, named the Coxsackie virus, was thought to be the vector of a disease which occurred in Europe about 1870 and was called epidemic muscular rheumatism. Sporadic outbreaks of epidemics having much in common with the Coxsackie epidemic had been reported in medical literature but speculation on this virus reached a new high with the Fannin county, Tex., epidemic which involved more than 8,000 cases. Whether the virus involved was identical to the Coxsackie virus originally isolated in 1947 was one source of conjecture; another even more startling development was the fact that the disease resembled poliomyelitis and that only one case of true poliomyelitis was reported from Fannin county, a far lower incidence than normal for that section. Research on both of these facets of the disease was continuing.

Positive proof of the identity of the Coxsackie virus was offered by the scientists who investigated an outbreak of 50 cases in Hoquiam, Wash., and isolated group B Coxsackie virus from stool specimens of patients. Increased frequency of identification of viruses helped to reveal a rapidly growing incidence of Coxsackie virus epidemics.

Poliomyelitis.—There was much evidence that certain predisposing factors might increase the incidence of certain types of poliomyelitis or the severity of poliomyelitis attacks. Evidence of an increased incidence of bulbar poliomyelitis following tonsillectomy had been presented and refuted on numerous occasions with the prevailing consensus being that tonsillectomies during the epidemic poliomyelitis season should be avoided.

Observations were made in Australia, England and Wales that inoculation of children with pertussis vaccine, diphtheria toxoid or penicillin was followed by a greater occurrence of paralytic poliomyelitis than was warranted by normal incidence rates, and that the paralysis was associated with the site of injection to an inordinately high degree. An obvious causal relationship was presumed and data to establish facts collected. Animal experimentation in mice injected intraperitoneally with pertussis vaccine alone or with diphtheria toxoid showed a significant decrease in the incubation period before the onset of paralysis as compared with controls. Editorially, the *Journal of the American Medical Association* discussed the clinical reports but withheld judgment until more data had been received, the while adjuring clinicians to postpone immunization with pertussis vaccine and diphtheria toxoid until after poliomyelitis outbreaks had subsided.

Basic research on poliomyelitis continued to offer more clues to the cryptic source of poliomyelitis and the often attendant paralysis. An investigation of the cockroach as an experimental vector of viruses indicated that the cockroach, *Periplaneta americana*, excreted infective amounts of Coxsackie virus for a 15-day period and that faeces from the roaches fed poliomyelitis virus resulted in the death of monkeys to which they were transferred.

Bacteria Boost Oil Production.—Bacterial inoculation of exhausted oil wells was reported to increase the flow of petroleum. From the cores of Louisiana oil wells, in Pacific ocean mud taken from 6,000 ft. deep and from the waters of the Chicago Drainage canal a microorganism was isolated which has the power to get oil from rock. *Desulfovibrio hydrocarbonoclasticus* is capable of breaking down heavy hydrocarbons into lighter ones, producing acids which dissolve rock in oil-bearing strata and generating carbon dioxide gas which increases the flow of oil by exerting pressure. Research in progress during 1951 was designed to find out how to make petroleum by microbial action.

Bacteria versus Atomic Energy.—Milk and meat irradiated by 24 or 40 hr. of exposure to X-ray and gamma rays from radioactive cobalt 60 were observed to remain unchanged after three weeks of storage in plastic bags at room temperature. Bacteriological analysis of the milk revealed it to be sterile. No trace of radioactivity remained in these foodstuffs. The possibility of food preservation as a by-product of the atomic pile thus presented itself, subject to further experimentation and analysis. (M. V. N.)

Badminton.

Joseph Alston of San Diego, Calif., dethroned Martin Mendez, a fellow townsman, as national ruler in the annual tournament of the United States Badminton association, played at Dallas, Tex., March 29–31, 1951. The Pacific coast stars met in the final round for the third time in a row and Alston, after twice bowing in hard-fought matches, routed the defending titleholder in straight games by 15–5, 15–5.

Ethel Marshall of Buffalo, N.Y., continued her domination of the women's ranks and won her fifth consecutive national title by defeating Thelma Scovil of Long Beach, Calif., 11–8, 11–6, in a contest between left-handers.

Alston, Wynn Rogers of Arcadia, Calif., and Mrs. Loma Smith of Pasadena, Calif., each figured in the winning of two national championships. After his victory in the singles, Alston paired with Rogers to capture the men's doubles title while Rogers and Mrs. Smith carried off the mixed doubles prize. Mrs. Smith had paired with Dottie Hann of Manhattan Beach, Calif., earlier in the tourney to take the women's doubles championship.

Howard Holman of Fresno, Calif., and Fred Fullin of Norwalk, Conn., who were seeded second, scored a surprise in the veterans' doubles by halting C. Raynor Hutchinson and Wayne Schell of Boston, Mass., 15–8, 2–15, 15–12, to win top honours in their division. (T. V. H.)

Bahamas.

This British colony consists of an archipelago of 21 inhabited and about 680 uninhabited islands off the coast of Florida. Area: 4,375 sq.mi. Pop.: (1950 est.) 79,000. Capital: Nassau, on New Providence Island. Governor in 1951: Maj. Gen. R. A. R. Neville.

History.—Butlin's vacation village at West End, Grand Bahamas, remained closed throughout 1951. No decision was reached as to its future, but negotiations with a group of U.S. financiers continued. Doubts were expressed as to the agricultural prospects of the Colonial Development corporation's large-scale project started in 1950. However, as a result of successful negotiations in 1950 about 4,000 agricultural workers were employed in the United States, and thanks to this and the building boom there was practically no unemployment on New Providence.

In an attempt to broaden the basis of the economy an Industries Encouragement act was passed offering substantial attractions to companies established under it. Any such company was permitted to bring in plant and equipment free of duty; neither plant nor industry would be subject to taxation other than the existing real-property tax for the first ten years; all duty paid on raw materials would be refunded on the exportation of the finished product; and there would be complete freedom to bring key workers.

Construction of guided missile stations in the Bahamas long-range proving ground proceeded satisfactorily.

Education.—Schools (1950): government and aided 124 (attendance 13,356), denominational 46 (3,591), private 7 (334). Higher education was provided at five schools in Nassau and there was a technical school and a teachers' training college at Oakes field.

Finance and Trade.—Currency: pound sterling; United States dollars also generally accepted. Budget (1950 actual): revenue £1,579,748; expenditure £1,658,741. Foreign trade (1950): imports £6,150,200; exports £904,671. The tourist trade remained the basis of the economy: tourists (1950–51 winter season) 37,500. (Jo. A. Hn.)

Baltimore.

Baltimore is the metropolis of Maryland and had a population of 949,708 in 1950. The land area of the city is 78.72 sq.mi.; the water area, 13.21 sq.mi. Mayor in 1951: Thomas D'Alesandro, Jr., Democrat.

Budget appropriations for 1952 were $166,657,113.38; for 1951, $141,236,789.76. The city tax rate for 1952 was $2.74 per $100 of assessed valuation and the rate for 1951 was $2.62. The taxable basis for 1952 was $2,600,466,616 and for 1951 it was $2,441,210,616. The gross funded debt, as of Nov. 30, 1951, was $219,370,700; the sinking funds amounted to $36,726,802.64, leaving a net debt on that date of $182,643,897.36, not including accrued income. The percentage of net debt to the taxable basis (excluding self-supporting indebtedness) was 4.74% for the year 1951.

The net enrolment on Oct. 31, 1951, in the public schools of the city was 81,321 white students and 43,873 Negro students; and, in addition, 12,605 white and 4,936 Negro students were enrolled in adult education classes. William H. Lemmel had been superintendent of the Baltimore city schools from July 1946. The public schools of Baltimore are a separate and distinct unit and are not under the jurisdiction of the state department of education.

Ranking as the second United States port in foreign-trade tonnage, the combined exports and imports at the port of Baltimore during the year 1950 amounted to 15,058,935 tons, compared with 17,001,355 tons for the previous year. Domestic coastwise and intercoastal shipments and receipts amounted to 9,243,191 tons for the year 1950. Total foreign-trade tonnage for the first seven months of 1951 came to 12,427,700 tons, or an increase of 46.8% over the January-July period of 1950.

Manufacturing activity in the Baltimore metropolitan area during 1951 continued the upward trend which began around the middle of 1950. During the first ten months of 1951 manufacturing employment averaged approximately 190,110 workers, an increase of 22,680 or 13.6% from the similar period in the previous year. The leading industry groups based upon the volume of employment included primary metal industries, blast furnaces and steelworks, food and kindred products, aircraft, apparel, fabricated metal products, machinery, electrical equipment, shipbuilding and repair, chemicals, automobiles, tin cans and tinware, beverages, printing and publishing. Total nonagricultural employment in the Baltimore metropolitan area, exclusive of self-employed, domestic servants and unpaid family workers, in the January-October period of 1951 averaged about 516,900, an increase of more than 35,300 or 7.3% over the first ten months of 1950. (H. E. F.)

Bananas: *see* Fruit.

Banking.

The most important development in banking in the United States during 1951 was the return to a more flexible monetary policy, freed from the limitation of supporting prices of government securities and keeping interest rates generally from rising. In March, the federal reserve system permitted long-term government bonds to sell below par, and in December substantial support was withdrawn from the short-term market. With the market free to reflect the balance between supply of and demand for funds, interest rates rose substantially during the year. The prime commercial loan rate rose from $1\frac{3}{4}$% in January to $2\frac{1}{2}$% in May and to 3% by December. The yield on long-term government taxable bonds increased from 2.39% in January to 2.74% as the year closed, while the yield on Aaa corporate bonds rose from 2.66% to 3.03%.

In accordance with the provisions of the Defense Production Act of 1950 and a related executive order, a program for voluntary credit restraint was prepared, including a statement of principles, and with the approval of the attorney general, on March 9 the board of governors of the federal reserve system addressed a request to all financing institutions in the United States to follow the program. Under the leadership of the national voluntary credit restraint committee headed by federal reserve board governor Oliver S. Powell, numerous regional and group committees were established. Commercial banks, life insurance companies, property insurance companies, investment banking firms, savings and loan associations and mutual savings banks joined in the program. Six bulletins were issued by the national committee, setting forth general principles to guide participants in meeting demands for inventory loans, business capital expenditure financing, state and local government borrowing, certain types of real estate credit, borrowing by foreigners and borrowing on unlisted securities. In a majority of cases financing institutions themselves took the initiative in approving or denying financing requests on the basis of the principles of the program and interpretations of specific credit areas.

New peaks were reached by the end of the year in total loans and investments of all commercial banks, at $133,411,000,000; in total loans, $58,300,000,000; in total commercial and industrial loans, about $26,600,000,000; and in holdings of state and local government and other securities, $13,200,000,000. Commercial bank holdings of the government securities declined slightly during the year to $61,900,000,000.

Total loans and investments of all commercial banks rose $6,700,000,000 during the year, somewhat more than in the preceding year. The expanding volume of defense production, changing consumer and business expectations as to inflation, and the impact of credit restraint and materials shortages, however, altered the pattern of credit expansion in several ways. The increase in commercial and industrial loans at all commercial banks during 1951 was about $4,700,000,000, almost the same as in the year before. A new series covering changes by industry and purpose in commercial and industrial loans at a large sample of weekly reporting member banks indicated that from April through December loans for defense and defense-supporting purposes comprised about half of the total increase in business loans classified. Loans of other kinds such as consumer and real estate loans, rose about $1,300,000,000 during the year, substantially less than the increase of $4,400,000,000 in 1950. As a result of this lesser increase, total loans of all commercial banks rose about $6,000,000,000 or 12% in 1951, as compared with a jump of $9,200,000,000 or 21% the year before.

On June 30, 1951, national banks, which numbered almost 5,000, held $86,589,000,000 of total deposits. State banks, which numbered about 9,200, had total deposits of $64,900,000,000.

The volume of bank debits at the banks in 333 reporting centres reached another record high level in 1951. In contrast to the sharp upward spiral following the outbreak of hostilities in Korea, however, the annual rate of turnover of demand deposits in both New York city and other leading centres showed virtually no change during the year as a whole.

Total consumer credit outstanding increased during the year by about $300,000,000, in sharp contrast to the rapid rise of $3,300,000,000 the year before. Automobile instalment sales credit declined slightly, and other instalment sales credit went down about $500,000,000. The net increase in the total was the result of moderate increases in instalment loans, charge accounts and single-payment loans.

Little change was shown in the gold stock over the year as a whole. The decline in the gold stock which had been under way since the fall of 1949 was brought to an end in May. During the third quarter, net gold imports made their reappearance, reflecting a sharp increase in the surplus of exports.

The year saw the first increase in money in circulation since the rapid wartime growth which ended in 1946. After an increase of $1,400,000,000 during the year, money in circulation stood at an all-time high of $29,403,000,000 on December 26.

During 1951 as a whole the gross federal debt increased by about $2,800,000,000 to $259,500,000,000 on December 31, 1951. There was a net shift of somewhat more than $10,000,000,000 from marketable issues to nonmarketable issues. Treasury bills outstanding rose by about $4,500,000,000; federal reserve holdings declined to very low levels, commercial banks showed some increase and holdings of business corporations went up substantially. Certificates and notes rose $2,900,000,000. Marketable treasury bonds declined by about $17,000,000,000, reflecting some exchange offerings into shorter issues but chiefly the exchange offering of long-term nonmarketable 2¾% treasury investment bonds for the marketable 2½% bonds maturing in June and December 1972. Another unusual debt operation during the year was the subsequent exchange by the federal reserve system of $1,500,000,000 of its holdings of the nonmarketable 2¾% treasury investment bonds for 1½% marketable five-year treasury notes. Redemptions of savings bonds exceeded sales during each month and by a total of $1,700,000,000 for the year as a whole, despite the marked increase in individual savings. Special issues, held by government trust funds and corporations, rose during the year by $2,200,000,000. The Jan. 1952 budget message of the president forecast an increase in the total public debt to $274,922,000,000, or just under the public debt limit, by June 30, 1953, as a result of estimated budget deficits of $8,200,000,000 in fiscal year 1952 and $14,446,000,000 in fiscal year 1953. (*See* also Debt, National.)

Corporate offerings for new money from Jan. through Nov. 1951 totalled $5,672,000,000, as compared with $4,000,000,000 in 1950, $4,606,000,000 in 1949 and $5,929,000,000 in 1948. New money offerings of manufacturing concerns were more than three times the 1950 level, reflecting heavy expansion for defense. About three-fourths of total corporate securities offered for cash in 1951 were bonds, and private placement of bonds accounted for more than half of the year's bond offerings.

New state and municipal financing in 1951 was about $3,200,000,000, less than the all-time record of $3,700,000,000 set in 1950 but more than in any other year. In spite of materials shortages and tax resistance by voters, at the end of the year an extremely large volume of state and local bonds was under consideration. (*See* also Business Review; Consumer Credit; Export-Import Bank of Washington; Federal Reserve System; Gold; International Bank for Reconstruction and Development.) (J. K. L.)

Mutual Savings Banks.—The combined assets of the mutual savings banks of the United States were $22,892,025,460 on July 1, 1951, a gain of $598,936,265 or 2.69% for the year. Deposits were $20,399,573,434, a gain of $460,260,489 or 2.31% for the year. On July 1, 1950, assets of these banks were $22,293,089,195, deposits $19,939,312,945, the respective increases during the year ended on July 1, 1950, being $1,180,947,148 or 5.59% and $991,292,834 or 5.23%. On July 1, 1951, the combined surplus of the banks was $2,323,270,025 or 11.39% of deposits compared with $2,209,947,477 or 11.08% of deposits for 1950. There was a decrease of 123,258 or 0.63% in the number of accounts during the year ended July 1, 1951. On that date there were 19,408,115 accounts. On July 1, 1950, there were 19,531,373.

For the year ended July 1, 1951, dividends credited to mutual savings accounts averaged 2.05% and hence constituted the major part of the 2.31% increase in deposits during the year.

On Dec. 3, 1951, there were in operation 529 mutual savings banks with 229 branches. Of the existing 229 branches, 17 were established during 1951.

The major changes in asset distribution from July 1, 1950, to July 1, 1951, were similar to those of prior years, that is, a decrease in amount and per cent of U.S. government securities and an increase in real estate mortgage loans, in large part insured by the Federal Housing administration (FHA) and the Veterans administration (VA) under federal statutory provision. The combined assets of all mutual savings banks on July 1, 1951, were invested as follows: U.S. government securities 44.65%, other securities 10.92%, real-estate mortgage loans 38.94%, and other assets 5.49%. The ratios on July 1, 1950, were: U.S. government securities 51.91%, other securities 10.91%, real estate mortgage loans 31.82%, and other assets 5.36%. At the close of the calendar year 1950 62.6% of the real estate mortgage loans held by all mutual savings banks combined were conventional or purchase money mortgages, 19.7% were FHA insured and 17.7% were VA insured.

The federal income tax-exempt status of mutual savings banks was removed by congress in Oct. 1951 by passage of the Revenue Act of 1951. Net income after expenses and dividends and after specified allowances for reserves was made subject to the corporation tax beginning with fiscal years after Jan. 1, 1952.

Savings Bank Life Insurance.—The combined amount of savings bank life insurance in force at the end of Oct. 1951 in the states of Connecticut, Massachusetts and New York was $622,516,234 representing 594,949 individual policies. The amount in force and policies represented classified by states were: Connecticut 16,886 policies for $16,459,769 in force; Massachusetts 443,819 policies for $418,294,767 in force; and New York 134,244 policies for $187,761,698 in force. In these three states there were 261 savings banks selling life insurance. Of these 83 were issuing banks and 178 were agency banks.

British Trustee Savings Banks.—As of Nov. 20, 1950, the combined funds of trustee savings banks in Great Britain exceeded £1,016,000,000. The comparative financial positions of the banks as between Nov. 20, 1949, and Nov. 20, 1950, were as follows:

	1950 £	1949 £
Cash balances due to depositors:		
Ordinary department	793,736,478	744,353,918
Special investment department	115,179,318	112,462,984
Government stock and bonds held for depositors (nominal value)	87,757,196	85,340,233
Combined surplus funds	19,354,147	18,468,139
Total funds	1,016,027,139	960,625,274

On Nov. 20, 1950, there were 84 banks with 1,151 branches in operation in the British Isles (England, Scotland, Wales and Northern Ireland). The total number of accounts of the three classes, ordinary, special investment and stock, was 7,174,752 as compared with 6,787,726 on Nov. 20, 1949. (HE. BR.)

Great Britain and Commonwealth.—The dislocation of the world prices structure, stemming in the first place from the violent movements in the main commodity markets after the opening of the war in Korea, dominated the banking scene in Great Britain, the Commonwealth, Europe and the middle east throughout 1951.

In Great Britain the impact on the banking structure of the rise in the prices of imported goods was cushioned during a large part of the year by the emergence of a substantial deficit in the country's external payments. The fact that imports were running far ahead of exports meant that the flow of sterling to the government exceeded the amount of sterling the government was required to transfer to the public in respect of the conversion of the foreign exchange proceeds of exports. The surplus accruing to the government from this source enabled it to deal with the tendency for budget receipts to fall short of outgoings and still retain considerable sums for reducing its indebtedness to the banking system. The effect of this was to apply a downward pressure on bank deposits and bring about a considerable net reduction in bank holdings of assets directly or indirectly concerned with lending to the government—call money, bills discounted and treasury deposit receipts. At the end of October the net deposits (*i.e.*, published deposits after deducting the duplicating item "balances in course of collection") of the London clearing banks, which together accounted for about 95% of all commercial bank resources in Great Britain were actually slightly lower than a year before. In accordance with official wishes, the banks made a general increase in rates of interest for almost all forms of business, including overdrafts, during the year.

Through the early months of the year, Australian deposits rose steeply, the total for the trading banks moving up to the record level of £A1,300,000,000 in April, as compared with £A1,000,000,000 a year before. Later in the year the relapse in the prices of important Australian commodities, assisted by a swing in the external payments from a position of surplus to deficit, exerted a downward pressure on the volume of money. At the end of August, the trading banks deposits at £A1,200,000,000 were only about £A200,000,000 higher on the year. Two of the largest trading banks—the Union Bank of Australia and the Bank of Australasia—merged to become the second largest Australian bank and the largest New Zealand bank under the title Australia and New Zealand bank.

Eleven London Clearing Banks
(£ million)

	Oct. 1949	Oct. 1950	Oct. 1951
Deposits	6,050	6,204	6,204
Net Deposits	5,868	6,006	5,981
Cash	499	509	514
Call money	556	557	579
Bill holdings	1,162	1,414	1,340
Treasury deposit receipts	744	496	177
Investments	1,517	1,505	1,555
Advances	1,466	1,598	1,897
Acceptances, etc.	261	346	481

In Canada, the government took steps early in the year to counter inflationary stresses generated by the rise in the world prices level. At the end of September, the deposits of the chartered banks were slightly lower than a year earlier. The total of advances to the public at $2,900,000,000 was about $650,000,000 higher but only $50,000,000 above the March figure. (C. H. G. T.)

Bankruptcy: *see* SECURITIES AND EXCHANGE COMMISSION.

Baptist Church. Two world events gave Baptists concern in 1951—the conflict in Korea and Pres. Harry S. Truman's nomination of an ambassador to the Vatican.

The former raised the question of missions in China, where all mission property was brought under control of the Communist government in 1951 and funds were frozen. But though most Baptist missionaries withdrew from Communist China, Christian work continued successfully under native leadership. The University of Shanghai enrolled 1,641 students; the religious program was not curtailed, elective courses in religion remaining in the curriculum.

United States Baptists, loyal to their historic principle of religious freedom, strongly objected to the president's nomination of the ambassador. Churches were urged to "reaffirm their historic traditional belief in the freedom of men everywhere and the ideal of the separation of church and state."

Whereas during World War II Protestants in Japan had been compelled to unite in forming the Church of Christ, in 1951 those requirements having been withdrawn, Baptists returned to their sectarian organizations. The Southern Baptist Convention of America reported 110 missionaries in Japan, with new school and church buildings being erected and rapid progress being made in evangelical and educational enterprises.

The Commonwealth and Empire Baptist congress, attended by hundreds of delegates, was held in London, Eng., June 4–9, 1951. Eight thousand Baptist churches with 4,000,000 members were recorded within the commonwealth. The Baptist Missionary society was supporting 400 missionaries in five fields with an annual budget of $840,000.

According to the *Baptist Times,* London, the first convention of German Baptists in the soviet-occupied zone of Germany was held in Berlin, June 12–25, 1951, with 418 delegates present. There were 200 Baptist churches with 35,200 members in this zone and 10 churches with 5,400 members in the west sector of Berlin. An official representative from the soviet-occupied zone brought greetings to the convention.

The *Canadian Baptist* stated that in 1951 Baptists, the largest non-Orthodox creed in the Soviet Union, had about 400,000 members, 3,000,000 adherents and about 3,000 churches, and that the Moscow Baptist church had 4,000 members. Three hundred and fifty people applied for membership in this church during 1951, and 150 were baptized.

Baptist statistics for Italy in 1951 listed 60 churches with more than 100 mission stations, 5,000 members in 12,000 families and a seminary at Rivoli-Turin with 20 students.

The Southern Baptist Theological seminary, Louisville, Ky., in 1951, for the first time in its 92 years, opened its doors to academically qualified Negro students. (*See* also CHURCH MEMBERSHIP.) (R. E. E. H.)

Barbados.

This British colony is the most easterly of the Caribbean islands. Area: 166 sq.mi. Pop.: (Dec. 1950 est.) 211,682. Capital and chief port, Bridgetown (pop. 1948, 13,345). Language: English. Religion: Christian (*c.* 70% Anglican). Governor in 1951: Sir Alfred Savage.

History.—An act to encourage the establishment and development of new industries, the Pioneer Industries (Encouragement) act, came into operation in 1951. It granted important measures of relief from customs duties and income tax to anyone establishing a factory for a new industry. Another act, which it was hoped might lead to even larger sugar crops than that of 1951, dealt with the control of underground water supplies. A third provided for increased levies on sugar and fancy molasses for the industry's labour welfare fund. The first elections under full adult franchise were held at the end of the year. It was doubtful, however, if the political campaign seriously distracted the attention of Barbadians from the exploits of the West Indian cricket team in Australia under the captaincy of a Barbadian, John Goddard.

Education.—Pupils in elementary schools (1950) 30,080; secondary 2,838. Expenditure: B.W.I. $1,906,328.

Finance and Trade.—Currency: British Caribbean or British West Indian dollar, set at 4.8 to the pound and valued at 58.33 cents U.S. Budget (1951–52 est.): revenue B.W.I. $10,576,000; expenditure B.W.I. $10,425,000 excluding development. Foreign trade (1950): imports B.W.I. $38,726,132; exports (including re-exports) B.W.I. $27,643,000. Principal exports: sugar, fancy molasses, rum. Sugar crop (1951), 187,663 tons. (P. H.–My.)

Barkley, Alben William

(1877–   ), vice-president of the United States, was born on a farm in Graves county, Ky., on Nov. 24, and attended Marvin college, Clinton, Ky., Emory college, Oxford, Ga., and the University of Virginia law school in Charlottesville, Va. He was elected prosecuting attorney of McCracken county, Ky., in 1905 and was judge of McCracken county court, 1909–13. He was elected to the U.S. house of representatives in 1912 and after 14 years there was elected to the U.S. senate. He was keynote speaker at the 1936 Democratic national convention, permanent chairman of the 1940 convention, and delivered the speech nominating Franklin D. Roosevelt for a fourth term at the 1944 convention.

Throughout much of World War II he was senate majority leader, and as such shepherded numerous wartime and emergency acts through that body. In 1946 when the Republicans gained control, he became senate minority leader. He was keynote speaker again at the 1948 party convention in Philadelphia, and there was nominated for the vice-presidency, being elected with Pres. Harry S. Truman and taking office in 1949.

In July 1951 President Truman addressed identical letters to Barkley and to House Speaker Sam Rayburn requesting action by congress to end the state of war between the United States and Germany. He explained that the U.S.S.R. had "actively prevented" a peace treaty, but at least this action by the U.S. would eliminate the stigma of the word "enemy" in dealings with Germany. On Sept. 23 Barkley told a Washington, D.C., conference of Jewish leaders that a strong state of Israel was "essential to all the democracies."

In November he and Mrs. Barkley made a visit to Japan and the Korean war front, his explanation being that he had the time to go and the president did not.

Barley.

The U.S. barley crop of 1951 was a small one of 254,668,000 bu., 16% less than the 303,533,000 bu. of 1950; the average for 1940–49 was 306,523,000 bu. Acreage harvested (9,391,000 ac.) was 16% less than in 1950; the yield of 27.1 bu. per acre was the third highest on record, but about the same as in 1950. North Dakota, with a production of 51,336,000 bu., replaced California (42,360,000 bu.) as the leading state, and Minnesota was third with 38,555,000 bu. The average price for the season to farmers was estimated at $1.24 per bushel as compared with $1.18 in 1950; late in the year prices were substantially higher than the estimated season average. An announced official production goal for 1952 called for at least 290,000,000 bu. of barley from 12,865,000 planted acres. The support price was announced at not less than $1.22 per bushel.

The world barley crop of 1951 was estimated at 2,600,000,000 bu., as compared with 2,435,000,000 bu. in 1950 and a prewar average of 2,365,000,000 bu. The acreage of 117,550,000 exceeded slightly that of 1950 and prewar. (J. K. R.)

Barley Production of the Principal Producing Countries

(In thousands of bushels)

Country	1951	1950	Average, 1935–39
U.S.S.R.	...	325,000	425,000
Canada	257,051	171,393	88,882

French Morocco	68,500	50,000	53,275

Baseball.

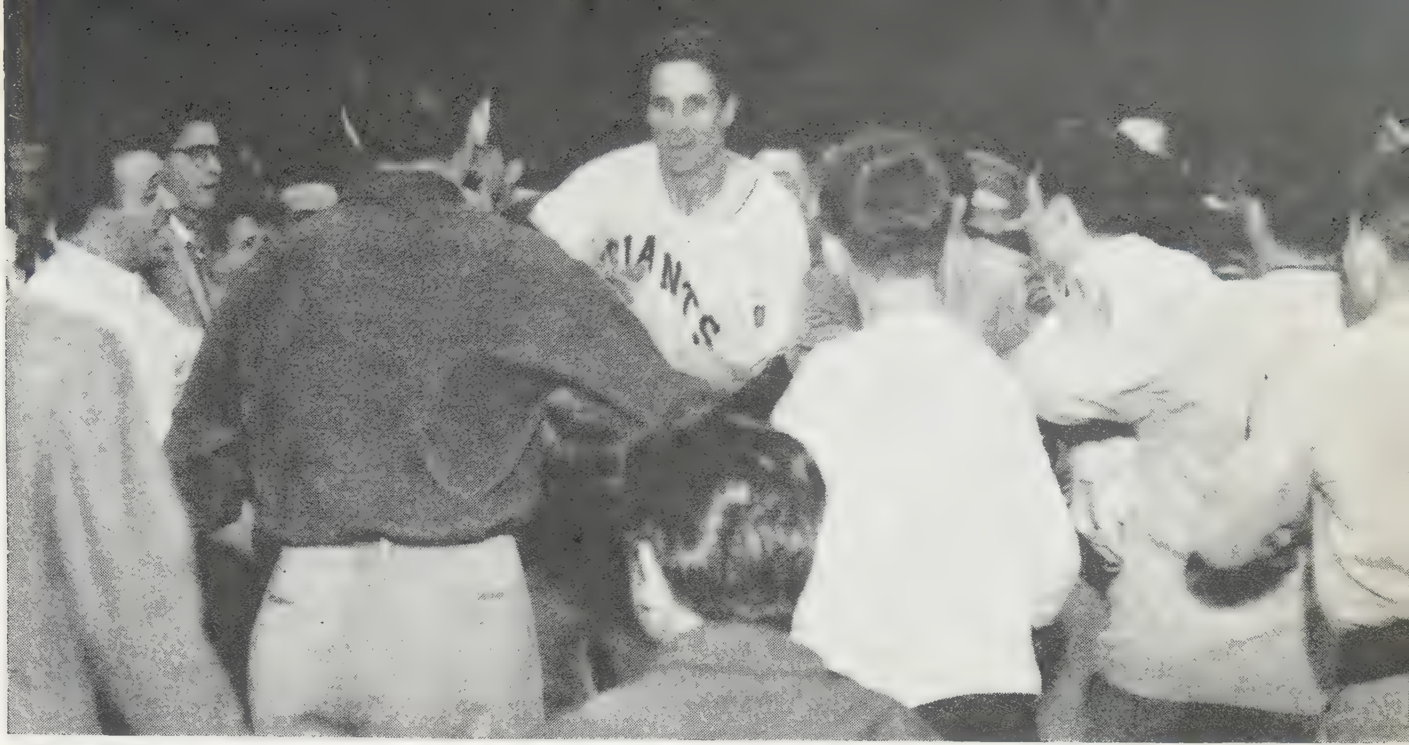
The year 1951 marked the 75th birthday of the National league and the 50th anniversaries of both the American league and the National association, the latter being the governing body of the minor leagues.

There were a few changes among the top executives of the game. One affected the highest post in the business—that of the commissioner. Another change saw a new president of the National league for the first time since 1934, a change necessitated by the elevation of Ford C. Frick to the commissionership. Another switch involved the ownership of the St. Louis American league club which was purchased by a syndicate headed by Bill Veeck.

Ford C. Frick, who was elected commissioner of baseball, was the third man to hold the office since it was started in the 1920s. He succeeded Albert B. Chandler, who had been chosen for the post in 1945, after the death of the first commissioner, Kenesaw M. Landis. Frick was elected to a term of seven years at an annual salary of $65,000.

As his successor at the helm of the National league, Warren C. Giles, who had been serving as president and general manager of the Cincinnati Reds, was elected.

There were five new managers in the major leagues when the season got under way. Jimmy Dykes, for 12 years (1934–46) manager of the Chicago White Sox, took over the reins of the Philadelphia Athletics, succeeding Connie Mack, the only other manager the Athletics had had in their 50-year existence. Al Lopez, for years one of the game's top catchers, was given the assignment in Cleveland, after having managed Indianapolis in the American association for three years. He succeeded Lou Boudreau, who was signed by the Boston Red Sox as a shortstop. The other freshman pilot in the American league was another former catcher, Paul Richards, who had managed the Seattle Rainiers of the Pacific Coast league in 1950. He was named to handle the Chicago White Sox, following Jack Onslow



BOBBY THOMSON of the New York Giants being carried from the field on the shoulders of admiring fans after his three-run homer won the National league pennant for the Giants Oct. 3, 1951

and John (Red) Corriden, who had divided the chore during 1950.

In the National league, Charles (Chuck) Dressen moved up from the Oakland Oaks of the Pacific Coast league to take over the helm of the Brooklyn Dodgers, following Burt Shotton in the post. Marty Marion, a veteran National league infielder who was known as "Mister Shortstop," made his managerial debut with the St. Louis Cardinals.

There were further shifts in the senior circuit as the season progressed. Boston Braves' skipper Billy Southworth resigned and Tommy Holmes was named the new manager. Later in the season Frank Frisch, one-time manager of the St. Louis Cardinals (1933–38) and the Pittsburgh Pirates (1940–46), was relieved of his command with the Chicago Cubs where he had taken over early in 1949. The Cubs replaced him with an active player, Phil Cavarretta, who had been with the team since 1934.

Managerial heads continued to roll after the season closed. Boudreau, who finished a nine-year tenure at the helm of the Cleveland club at the close of the 1950 season, replaced Steve O'Neill as manager of the Boston Red Sox. Rogers Hornsby, one of the greatest right-handed hitters in the game's history, returned to the major leagues as pilot of the St. Louis Browns. He replaced James (Zach) Taylor, who had been the Browns' manager since 1948. Marty Marion's contract with the Cardinals was not renewed, and, after much negotiation, the Cardinals traded pitcher Max Lanier and outfielder Chuck Diering to the New York Giants for second baseman Eddie Stanky, who was immediately named manager.

The famous "Yankee Clipper," Joe DiMaggio, announced that he was retiring from the game. Thus ended the career of one of the most brilliant players. DiMaggio was a star from the time he joined the Yankees in 1936 as a rookie after three years with the San Francisco Seals of the Pacific Coast league. In 13 years of play (he spent three seasons in the army) DiMaggio's outstanding performances included: a record streak of 56 consecutive games in which he batted safely; playing in more world series games than any other player in history; playing on nine world championship teams, also a record; and leading the league in batting (1939, 1940), home runs (1937, 1948) and runs batted in (1941, 1948). In 1939, 1941 and 1947 he was chosen the American league's most valuable player.

Important legislation enacted by organized baseball during the year was the creation of a standard that must be met by any group of clubs wishing to become a major league, and the setting up of a new minor league classification.

The minor leagues are grouped into six different classifications: AAA, AA, A, B, C and D. However, voted into existence was a new division to be known as the "open classification." In order for a league to be classified in this open group, it must, among other things, remove all salary limits, show an average annual attendance of 2,250,000 or more over a five-year period, have an aggregate population of 10,000,000 and a combined park capacity of at least 120,000. The benefits of the open classification include the right of a player to waive, if he so desires, his chance to be drafted into the major leagues, and an increase in the sale price of those players drafted from $10,000 to $15,000.

The Major League Executive council also recommended the standards that would have to be met by any group desiring to be a major league. Included was the fact that it was not necessary for the group making application to be an organized league, but could be any group of eight clubs which could meet the requirements. Among those requirements were an aggregate population of 15,000,000 in the eight cities, 25,000 capacity in any single park, an average paid attendance of 3,500,000 over a three-year period next preceding the application, a balanced schedule of at least 154 games, adoption of the major league minimum salary ($5,000 per year) and no maximum and the adoption of the players' pension plan or a comparable one.

There were several important trades during 1951. Just before the June 15 trading deadline the Chicago Cubs and the Brooklyn Dodgers engaged in an eight-player swap which sent outfielder Andy Pafko, infielder Wayne Terwilliger, pitcher Johnny Schmitz and catcher Al Walker to Brooklyn in exchange for outfielder Gene Hermanski, infielder Eddie Miksis, pitcher Joe Hatten and catcher Bruce Edwards. In another deal the Pittsburgh Pirates sent outfielder Wally Westlake and pitcher Cliff Chambers (who pitched a no-hitter earlier in the year) to the St. Louis Cardinals in exchange for pitcher Howie Pollet, catcher Joe Garagiola, outfielder Bill Howerton, infielder Dick Cole and pitcher Ted Wilks.

Two more big swaps were made after the close of the season. In one the St. Louis Browns traded catcher Sherman Lollar, infielder Tommy Upton and pitcher Al Widmar to the Chicago White Sox for pitcher Dick Littlefield, catcher Gus Niarhos, infielders Gordon Goldsberry and Joe DeMaestri and a highly touted rookie outfielder, Jim Rivera.

The other deal was made in the National league when the Cincinnati Reds sent pitcher Howie Fox, catcher Forrest Burgess and infielder Connie Ryan to the Philadelphia Phillies in exchange for pitcher Niles Jordan, catcher Andy Seminick, infielder Eddie Pellagrini and outfielder-first baseman Dick Sisler.

The New York Giants and the Chicago White Sox were both beneficiaries of early season deals. The coincidence went further in that each club acquired a young Negro outfielder who was destined to be a strong contender for "rookie-of-the-year" honours in his league. After he had appeared in eight games with Cleveland, the White Sox secured Orestes Minoso, an outfielder-third baseman with amazing speed, who finished the year as the American league's second-highest batter and leading base stealer. The Giants, needing another outfielder, brought up 19-year-old Willie Mays from their Minneapolis farm, where he had started the season sensationally and was batting .477. He became the regular centre fielder and his standout defensive play, 20 home runs and .274 batting average contributed heavily to the pennant-winning cause.

The Yankees scored a double triumph among their personnel when young third baseman Gil McDougald was voted the American league's "rookie of the year." Another laurel-winner for the Yankees was their catcher, Lawrence (Yogi) Berra, who was named the American league's most valuable player.

Mays won the freshman award in the National league and the most valuable player selection was another receiver, Brooklyn's Roy Campanella. The Dodger catcher had an outstanding year both behind the plate and at bat, hitting 33 home runs, driving in 108 and batting .325. These selections were made by the Baseball Writers' Association of America.

Records.—It was not much of a year from a record-making standpoint, most of the new major league marks being merely additions to former records held by the same team or player. The individual leagues, however, saw several new circuit records set.

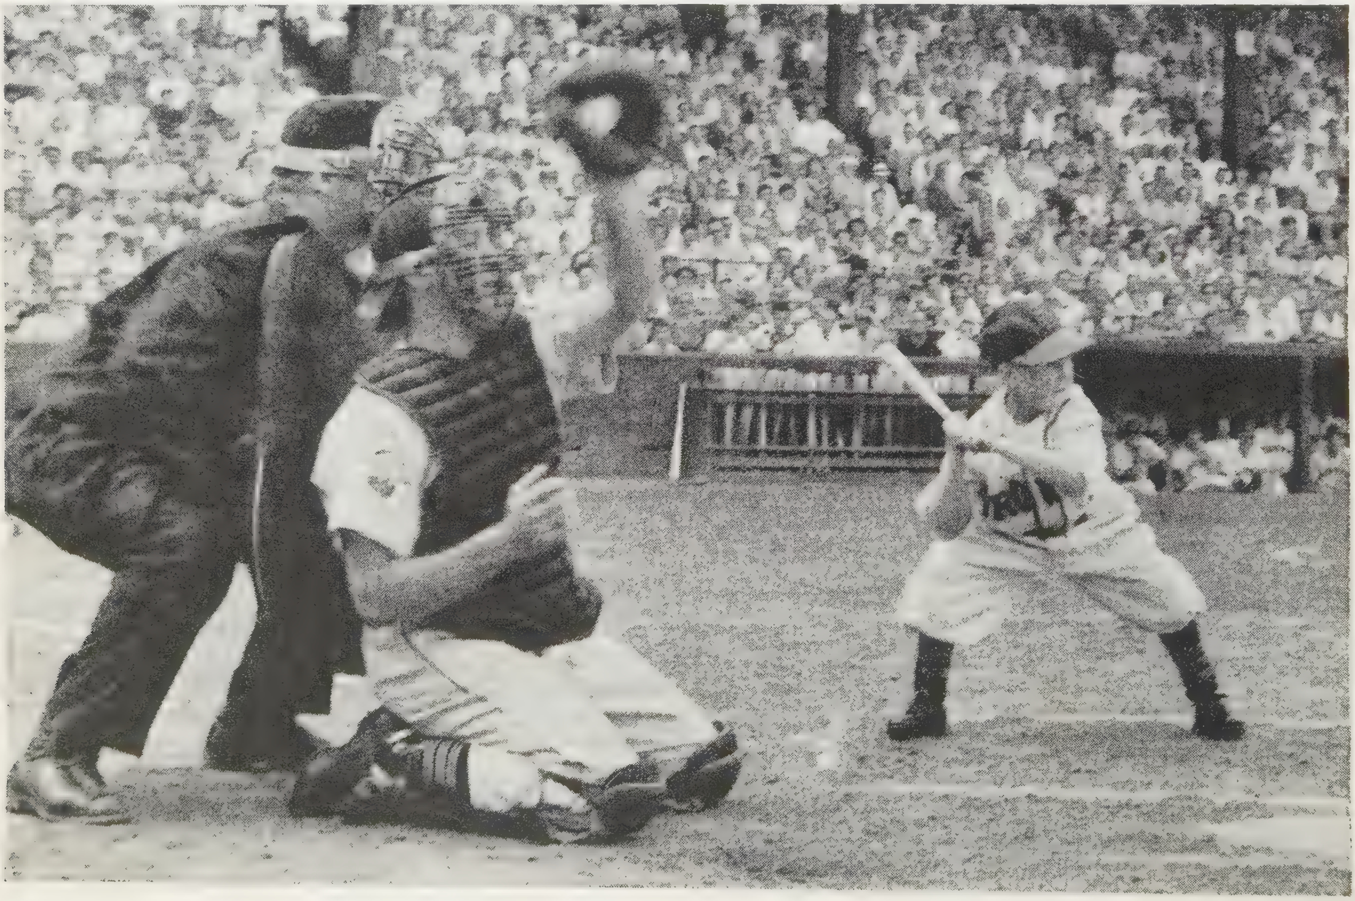
In the American league, major league records were tied by: Gil McDougald, by batting in six runs in one inning; Al Rosen, Cleveland third baseman, who hit four bases-filled home runs during the year; Tommy Byrne, St. Louis pitcher, who walked 16 men in one game; Bobby Feller, Cleveland's great hurler, who brought his lifetime total of no-hit games to three; and Allie Reynolds, Yankee right-hander, who pitched two no-hitters during the season.

League marks were set by: Alfonso (Chico) Carrasquel, Chicago shortstop, who handled 297 consecutive chances without an error; the Chicago White Sox and Boston Red Sox, by playing a 19-inning night game; the Red Sox and New York Yankees, who took 3 hr. and 30 min. to play a nine-inning game; and by the Yankees and Detroit Tigers, who used a total of 39 players in one game.

In the National loop, major league records were tied by among others: Stan Musial, when, for the fifth time, he led the circuit in three-base hits; Willard Marshall, Boston outfielder, who, in 126 games, did not make an error; and by the Pittsburgh Pirates, who left 18 men on base in one game.

Outstanding league marks were created by: first baseman Gil Hodges and second baseman Jackie Robinson, both of the Dodgers, who set new double-play records for their positions, the former with 171 and the latter with 137; all clubs, when the league mark for double plays was broken by the 1951 number, 1,337; and by the perennial rivals, the Brooklyn Dodgers and the New York Giants, who, in one game, allowed a total of 24

EDDIE GAEDEL, 3-ft. 7-in. midget, pinch-hitting to draw a walk for the St. Louis Browns, who were in last place in the American league in Aug. 1951. A subsequent ruling banned midgets from American league games



bases on balls.

In the National league only one no-hit game was pitched, that by Cliff Chambers, then with Pittsburgh, over Boston on May 6. In the other circuit three such games were pitched. Allie Reynolds did it twice, once against Cleveland, and again on Sept. 28 against Boston in a game that assured the Yanks of at least a tie for the pennant. Bobby Feller tossed the other against Detroit.

Major League Races.—The chase for the championship in the National league was one of the most thrilling in history. The Brooklyn Dodgers got off to an early lead, which, by mid-August, had become a 13-game advantage over the remainder of the field. The New York Giants, on the other hand, fared badly as the season got under way, suffering an 11-game losing streak. But Manager Leo Durocher pulled his team together and they started in pursuit of their high-flying interborough rivals. As the season drew to a close the New York club was victorious in 38 of its final 45 games, a blistering pace that enabled the Giants to come into the morning of the next to the last day of the season in a deadlock for first place. Both Brooklyn and New York won their two remaining games, the Dodgers their finale in a 14-inning thriller in Philadelphia, and, for the second time in the 75-yr. history of the circuit (the first was in 1946), two teams finished the campaign in a dead heat. As a result it was necessary to play a two-out-of-three play-off series.

The first game of the play-off was held in Brooklyn's Ebbets field and the Giants won, 3–1, behind right-hander Jim Hearn. The second game was played at the Giants' home park, the Polo Grounds, and this time the Dodgers routed the home club, 10–0, the winning pitcher being rookie Clem Labine.

And so the success of both clubs hinged on the outcome of one game. It was also played in the Polo Grounds and was tied 1–1 at the end of seven innings. In the eighth inning the Dodgers scored three times and led 4–1 when the Giants batted in the last inning. They had scored a run and had two men on base with only one out when Bobby Thomson, Giant third baseman, hit one of Ralph Branca's pitches into the left field stands to make the Giants National league champions for the first time since 1937.

Meanwhile the American league race was over. The Yankees clinched the flag with two days remaining on the schedule. However, it had been a pretty tight race until the final week when the Cleveland Indians and Boston Red Sox collapsed. It was the Yankees' 18th American league flag since 1921 and the 3rd in the three-year tenure of Manager Charles (Casey) Stengel.

Individual Performances.—Stan (The Man) Musial, St. Louis Cardinals' outfielder, led the National league in batting for the fifth time in his career (1943, 1946, 1948, 1950, 1951) with a mark of .355. American league batting honours went to the first baseman of the Philadelphia Athletics, Ferris Fain, who set the pace with a .344 average.

It was one of the biggest years in modern times in the matter of 20-game-winning pitchers with no fewer than 13 big league moundsmen reaching that figure. The National league had seven such hurlers: Sal Maglie and Larry Jansen of the Giants, with 23 each; Preacher Roe of Brooklyn (22); Warren Spahn of the Boston Braves (22); Robin Roberts of the Phillies (21); Don Newcombe of the Dodgers (20); and Murry Dickson of the Pittsburgh Pirates (20). In the American league there were six pitchers in the charmed circle: Bob Feller of the Cleveland Indians (22); Ed Lopat and Vic Raschi of the Yankees, each with 21; and Early Wynn and Mike Garcia of the Indians and Ned Garver of the Browns with 20 apiece. Most outstanding of these totals was that of Garver, who won for the Browns 20 of their 52 victories during the season.

Home-run honours again went to Ralph Kiner, the powerful Pittsburgh outfielder. His 1951 total was 42. In the American league the leading home-run producer was Philadelphia outfielder Gus Zernial, who blasted out 33 round-trippers. Monford (Monte) Irvin of the New York Giants, who played both first base and left field, batted in the most runs in the National league with 121, while Zernial was also the leader in that department in the American loop with 129.

All Star Game.—By using the same weapon that had so often caused their downfall in the midsummer classic—the home run—the National league defeated the American league, 8–3, before 52,075 in Detroit's Briggs stadium. Stan Musial, Ralph Kiner, Bob Elliott of the Boston Braves and Brooklyn's Gil Hodges hit four-baggers for the winners and Vic Wertz and George Kell, both of the Detroit team, hit homers for the losers. New York's Sal Maglie was the winning pitcher, and Eddie Lopat of the Yankees was the loser. It was the sixth National league victory in 18 games and their second in a row.

World Series.—For the sixth time in baseball history the New York Giants and the New York Yankees met in the world series. The Yankees defeated their intercity rivals four games to two, to bring them their 14th world championship since 1923 and their 3rd in the last three years.

The series opened in Yankee stadium on Oct. 4, with 65,673 fans on hand. Manager Casey Stengel nominated his ace, Allie Reynolds, to do the Yankees' pitching, and Leo Durocher's nominee was a surprise choice—left-hander Dave Koslo. It was expected by many that 23-game winner Larry Jansen would be the Giant's choice, but Koslo pitched and won, defeating the Yankees 5–1.

Jansen was Durocher's choice for the second game, opposing Eddie Lopat, and the Yankees tied the series at one game each by winning 3–1. After scoring in the first inning on two bunts and a pop fly single, the Yankees scored again on Joe Collins' home run in the second inning, and Lopat drove home the final tally with a single in the eighth.

The series then moved to the Polo Grounds and the Giants moved back into the lead when they won the third game, 6–2. Vic Raschi was the starter for the Yankees and Jim Hearn for the Giants. The game was a close one, the Giants leading 1–0 until the fifth inning when they added five more runs, featured by Carroll (Whitey) Lockman's three-run homer.

The following day (Sunday) the game was postponed because of rain, and the Yankees evidently profited from the rest, for they came back to win the next three games and the series. On Monday they won by the identical score by which they had been beaten on Saturday, 6–2. Reynolds was the winner over the Giants' ace, Sal Maglie. The outstanding blow of the game was Joe DiMaggio's two-run homer, the last of his illustrious career.

The Yankees made it three games to two when they won the fifth game 13–1, the biggest margin of victory in a series game in 15 years. Gil McDougald, the rookie third baseman of the Yankees, became the third man in world series history to hit a home run with the bases loaded when he hit one of Larry Jansen's pitches out of the park in the third inning.

The final game was played back at Yankee stadium and it was a victory for the A.L. forces, 4–3. The Giants went into the first half of the ninth trailing 4–1, but, with two out, they had one man on second and two runs in. Sal Yvars, utility catcher, was called upon to pinch-hit and he hit a sinking line drive to right field on which Hank Bauer made a sensational sliding catch to bring the title to the Yankees.

The six games attracted a total of 341,977, and receipts totalled $1,633,457.47. Of this amount the players' pool was $560,562.37, which provided each Yankee a winning share of

$6,446.09 and each Giant a loser's cut of $4,951.03.

Attendance.—While the turnstile count was off generally, the Chicago White Sox enjoyed a fine year at the gate, drawing a total of 1,328,234. This was 344,831 over their previous high of 983,403, set in 1946. While some of the other clubs showed a slight improvement, in Detroit the Tigers played to about 800,000 fewer customers in 1951 than they had in 1950.

The New York Yankees were again the number one gate attraction, although they failed to draw 2,000,000 for the first time in six years. Their total was 1,950,107.

Following are the 1951 attendance figures compared with those of 1950:

American League

Club	1951	1950	Change
New York	1,950,107	2,081,380	—131,273
Cleveland	1,704,984	1,727,464	— 22,480
Chicago	1,328,234	781,330	+546,904
Boston	1,312,282	1,344,080	— 31,798
Detroit	1,132,641	1,951,474	—818,833
Washington	695,167	699,697	— 4,530
Philadelphia	465,469	309,805	+155,664
St. Louis	293,790	247,131	+ 46,659

National League

Club	1951	1950	Change
Brooklyn*	1,282,628	1,185,896	+ 96,732
New York*	1,059,539	1,008,878	+ 50,661
St. Louis	1,013,429	1,093,411	— 79,982
Pittsburgh	980,590	1,166,267	—185,677
Philadelphia	937,658	1,217,035	—279,377
Chicago	894,415	1,165,944	—271,529
Cincinnati	588,268	538,794	+ 49,474
Boston	487,475	944,391	—456,916

*Brooklyn and New York figures do not include the play-off. The one game at Ebbets field drew 30,707 and the two games at the Polo Grounds drew a total of 72,929.

Hall of Fame.—Two new members were elected to baseball's Hall of Fame at Cooperstown, N.Y. Both won their fame as home-run hitters. Jimmy Foxx, a first baseman who spent most of his years with the Philadelphia Athletics and Boston Red Sox and one of the most powerful right-handed hitters in the game's history, was one. The other was Mel Ott, right fielder of the New York Giants and later the club's manager.

Final Major League Standings, 1951

National League				American League			
Club	Won	Lost	Pct.	Club	Won	Lost	Pct.
New York	98	59	.624	New York	98	56	.636

	Wisconsin State	Sheboygan (Wis.)	(no play-offs)

*Did not finish season.

The Minor Leagues.—Fifty minor leagues started the 1951 season, and all but one finished. The lone failure was that of the class C Border league, a six-team circuit located in northern New York state and Ontario, Can. Milwaukee of the American association defeated Montreal, of the International league, in the little world series, four games to two. In the Dixie series, the Birmingham Barons (Southern) defeated the Houston Buffaloes (Texas). (F. C. Fr.)

Basketball.

Despite the scandal of "fixed" contests that broke early in the season to shock the sports world as no other exposure had since the infamous "Black Sox" baseball series, the court game lost little of its popular appeal during 1951.

Kentucky, ranked first in the nation in the Associated Press poll and generally conceded top position, captured the National Collegiate Athletic association championship. The Wildcats won the crown by defeating Kansas State, 68–58, in the final play-off at Minneapolis, Minn., as Bill Spivey led their attack with 22 points. Illinois took third-place honours by conquering Oklahome A. and M., 61–46. Kansas State reached the title round by upsetting the Oklahoma Aggies, 68–44, in the Western play-offs at Kansas City, Mo. Kentucky had earned the right to play at Minneapolis by eliminating Illinois, Big Ten champion, 76–74, in the Eastern play-off final before 16,425 persons in New York city's Madison Square Garden. A field goal by Shelby Linville in the closing 17 sec. won for Kentucky. Spivey's 28 points made him the high scorer.

Illinois had furnished a surprise earlier in the sectional play-offs by halting undefeated Columbia, 79–71. The Lions had won 22 straight games during their regular season to extend

POLICE STATION in New York city during the booking of persons charged on Feb. 18, 1951, with bribery in the "fixing" of college basketball games. Two of the players are at left front, a detective at centre front their string through 31 contests and give Columbia its first perfect campaign in history and the Eastern Intercollegiate (Ivy) league championship.

Brigham Young came through on top in the National Invitation tourney at Madison Square Garden, routing Dayton, 62–43, in the final battle.

Although winning the N.C.A.A. crown, Kentucky was shorn of laurels it had worn for seven consecutive campaigns when it lost to Vanderbilt, 61–57, in the Southeastern conference tournament, although the Wildcats again took the title during the regular conference season.

The West routed the East, 75–59, in the sixth annual All-Star contest at Madison Square Garden on March 31. Oregon State furnished a surprise by stopping Bradley, 75–45, in the final of the Hawaiian Invitation tourney. St. Francis of Brooklyn, N.Y., annexed the National Catholic Invitation competition by defeating Seattle, 93–79, at Albany, N.Y. Hamline university of St. Paul, Minn., gained the national intercollegiate crown for the third time when it toppled James Millikin university, 69–61.

North Carolina State beat Duke, 67–63, for its fifth straight victory in the Southern conference tourney. Texas A. and M. advanced to the Western N.C.A.A. play-offs by conquering Texas in a three-game series after the Southwest conference race had ended in a tie among Texas, the Aggies and Texas Christian. Washington won on the Pacific coast and the Oklahoma Aggies triumphed in the Missouri valley. Kansas State paced the Big Seven, Brigham Young the Skyline Six conference and Arizona the Border conference. American university was king of the Mason-Dixon group.

The U.S.S.R. captured the European championship, defeating Czechoslovakia, 45–44, in the concluding game of the tourney. The unbeaten Russians reached the title round by halting Bulgaria, 72–54, while the Czechs advanced by subduing France, 59–50.

The men's national Amateur Athletic union title was taken by the Stewart Chevrolets of San Francisco, Calif., and the women's laurels were annexed by the Hanes Hosiery team of Winston-Salem, N.C.

Professional basketball showed a drop in attendance although the long season did not end until April 21 when the Rochester Royals defeated the New York Knickerbockers, 79–75, in the seventh contest of the final play-off series for the National Basketball association title. (T. V. H.)

Baudouin I

(1930–), king of the Belgians, was born at Stuyvenberg castle, near Brussels, on Sept. 7, elder son of King Leopold III and Queen Astrid. Just before he was five he lost his mother in a motor accident and was almost ten when Belgium was invaded by the Germans. He accompanied his father during his internment in Germany (June 1944–May 1945) and his subsequent voluntary exile in Switzerland. He was for the most part privately educated but during his father's stay at Pregny, near Geneva (1945–50), he attended a state college at Geneva. As prince royal he acted as head of the state from Aug. 1950, when his father delegated to him the exercise of the royal prerogatives, until Leopold's abdication on July 16, 1951. He took the oath as King Baudouin I before both houses of parliament and the officers of state on July 17. Leopold was allowed to retain the courtesy title of King Leopold.

Belgian Colonial Empire.

The Belgian colonial empire consists of the colony of the Congo in central Africa and the adjacent trust territories of Ruanda and Urundi administered with the Congo. Total area: about 925,094 sq.mi. Total pop. (1951 est.): 14,929,200. Areas, populations, capital towns, status and governors of the separate territories are given in the table.

Belgian Colonial Empire

Country	Area (In sq.mi.)	Population (1951 est.)	Capital	Status	Governor
Belgian Congo	904,974	11,132,500 (incl. 59,157 Europeans)	Léopoldville	Colony	Eugène Jungers, governor general
Ruanda	20,120	3,796,700 (incl. 2,805 Europeans)	Nianza	Sultanates, trust territories	
Urundi			Kitega		

History.—In 1951 the forces in the Belgian Congo amounted to 10,000 native troops. One unit was stationed at Kamina, the new Belgian military base in the Lualaba province, where small Belgian forces were directing the construction of barracks, munition and fuel dumps and an airfield. Belgian airborne troops and commandos were expected to be established there by 1952.

Exports from the Belgian Congo and from the trust territories Ruanda and Urundi during the first nine months of 1951 amounted to 14,205,200,000 fr. against 9,190,300,000 fr. during the corresponding period in 1950. About 46% of the exports went to Belgium, whereas the homeland provided 40% of the imports of the colony.

For the fulfilment of the ten-year plan for the development of natural resources $160,000,000 was invested in 1951, through a loan by E.C.A. and the floating of a loan of 60,000,000 Swiss francs, the latter being used for the payment of Swiss electrical equipment. The government published a similar ten-year plan for Ruanda and Urundi.

An agreement was signed with Great Britain in April for the construction of a deepwater berth at Dar-es-Salaam where the Belgian Congo already enjoyed special port facilities. At the end of the year a transport crisis caused by accumulation of goods developed at key points of traffic in the Congo. The licence system for imports and exports had to be revised to give priority to essential goods. (*See* also International Bank for Reconstruction and Development.) (M. Ss.)

Finance.—Budget: Belgian Congo (1950 est.) revenue 4,032,200,000 fr., expenditure 4,008,900,000 fr.; (1951 est.) revenue 5,125,500,000 fr., expenditure 4,959,100,000 fr. Ruanda and Urundi (1950 est.) revenue 276,600,000 fr., expenditure 325,200,000 fr.; (1951 est.) revenue 321,300,000 fr., expenditure 363,900,000 fr. Monetary unit: Congolese franc, nominally an independent currency, actually at par with the Belgian franc and with an exchange rate (Sept. 1951) of 50.50 fr. to the U.S. dollar.

Foreign Trade.—Belgian Congo and Ruanda and Urundi (1950): imports 9,559,000,000 fr., exports 13,595,000,000 fr.

Transport and Communications.—(Belgian Congo and Ruanda and Urundi). Roads (1949): 111,971 km. Railways (1949): 4,756 km. Waterways (1948): 25,412 km., including 12,284 km. for barges of 40 gross tons. Licensed motor vehicles (Belgian Congo only, Dec. 1950): cars 11,500, commercial 12,000.

Principal Products.—Belgian Congo and Ruanda and Urundi (1950, metric tons if not otherwise stated): copper, metal 193,917; tin, metal 14,792; cobalt 5,070; cotton 47,000; coffee 31,400; gum copal (exports) 12,476; gold (fine ounces) 339,000; silver (fine ounces) 4,469,000; (1949, metric tons if not otherwise stated): manganese ore 12,247; tungsten 169; cadmium 25; zinc, concentrates 109,263; coal 152,370; palm oil (exports) 121,766; palm kernels (exports) 80,034; maize 17,271; timber (exports) 71,313; diamonds (carats) 9,884,000.

Belgium.

A kingdom in western Europe, Belgium is bounded southwest by France, north by the Netherlands and east by Germany and Luxembourg. Area (including some Ger-

LEOPOLD III signing abdication papers ending his 17-year reign as king of the Belgians on July 16, 1951. His son, Baudouin I (right), was formally proclaimed king on July 17

man frontier localities annexed on April 15, 1949): 11,782.5 sq.mi. Pop.: (1947 census) 8,512,195; (Dec. 1950 est.) 8,654,000. Languages (1930): Flemish (Dutch) 42.92%, French 37.56%, German 0.85%, Flemish and French 12.92%, German and French 0.83%. Religion: mainly Roman Catholic. Chief towns (pop., 1948 est.; first figure including suburbs, second figure commune only): Brussels (cap., 1,296,687; 185,112); Antwerp (chief port, 794,280; 266,636); Liège (573,176; 156,664); Charleroi (445,229; 26,262); Ghent (442,792; 166,797); Namur (215,069; 31,637); Bruges (200,850; 52,984). Ruler: King Baudouin I (*q.v.*); prime minister: Joseph Pholien.

History.—A long period of constitutional dispute ended in Belgium when, on July 17, 1951, Prince Baudouin took the oath in parliament and became the fifth king of the Belgians. After King Leopold's return to the country on July 22, 1950, disorders had occurred and the king was persuaded to transfer his royal powers to the heir to the throne, who, on Aug. 11, 1950, took the oath and became the prince royal, pending his accession to the throne on Sept. 7, 1951, when he would be 21. However, in June 1951 King Leopold suggested to the prime minister and to the presidents of the Christian Social, Socialist and Liberal parties to advance the accession to the throne because, in his opinion, calm and unity were sufficiently restored. On July 16, in the throne room of the royal palace in Brussels, King Leopold signed the abdication act.

Political.—Pholien tendered the government's resignation after the accession ceremony but King Baudouin asked him to remain in office. The government issued from the Christian Social party, retained a majority of four in the house of representatives and of seven in the senate. The government party itself was an amalgamation of Roman Catholic peasants, workers, middle classes, industrialists and landowners. Changes in the government had been forecast because of controversies on economic and labour policies, but King Baudouin's decision made an end to the speculations, and Pholien had declared that only an adverse vote in parliament would force him to reconstruct his cabinet or to resign. For months contrary influences within his own party were brought to bear upon the prime minister. The house of representatives reassembled on Nov. 6 to question the government. At the end of the debate a vote of confidence was passed but Pholien felt compelled to enter into negotiations for the appointment of a minister for co-ordination of economic policy. The prospect of a political crisis resulting in dissolution of parliament, and of new elections which might destroy its small majority, kept the Christian Social government in the saddle.

Economic and Financial.—The Korean war and rearmament in western Europe caused appreciable changes. The index of industrial production (1936–38 = 100) stood at 148.6 in Nov. 1951 compared with 122 in Jan. 1950. In May ended the period of increased imports, mainly of raw materials, whereas in October exports reached the record figure of 12,474,000,000 fr. (about $250,000,000). The monthly average of exports in 1949 was 6,649,000,000 fr. (about $133,000,000). The increase of the cost of living since Sept. 1949 was estimated at 9% compared with 30% in France and 23% in the Netherlands. In the European Payments union (E.P.U.) Belgium became the biggest creditor nation. At the end of September there was a credit overdraft of more than $80,000,000 and in October the government introduced a series of measures to stop speculative imports of capital from countries of the E.P.U. Imports of goods from the dollar area were restricted to promote purchases in the E.P.U. area. On the other hand, exports to E.P.U. countries were discouraged by blocking 5% of the proceeds.

International.—Co-operation between the Netherlands and the Belgo-Luxembourg Economic union continued, but the formal beginning of the Benelux Economic union underwent delay because of the Netherlands' balance of trade deficit. At the end of the year the three governments were examining the draft of a convention introducing economic union with some temporary restrictions. In March the Belgian delegates initialled the provisional convention on the Schuman plan for pooling the coal and steel resources of western Europe. Provisions were included in the convention to avert any closing down of Belgian coal mines during the first five years, but misgivings remained. Moreover, the question was raised whether the submission to a supranational authority, not responsible to the Belgian parliament, was in accordance with the constitution.

Defense.—In March parliament passed the bill extending military service from one to two years. The strength of the Belgian forces increased from 72,000 in 1950 to 110,000 in 1951. In 1952 the figure was expected to be 130,000 and 163,000 in 1954.

Construction began on 26 British camps in the area between Lierre, Herentals and Turnhout for the supply of British forces in Germany. In January the prince royal signed a decree placing the Belgian fighting forces at the disposal of the North Atlantic Treaty organization. The decree established a precedent because, by virtue of the constitution, the head of state is the commander in chief of the Belgian forces. At the time of the North Atlantic council meeting in Rome (November) the question of a European army came in the forefront. The Belgian government considered such an army desirable provided that it should increase the strength of Atlantic defense, encourage European unity and integrate western Germany into a western defense community, but many objections were raised as to the powers of the higher authority governing the European army and the amalgamation of Belgian and other troops at the risk of separating Walloon and Flemish soldiers to the detriment of Belgian unity. (*See* also EUROPEAN RECOVERY PROGRAM; EUROPEAN UNION; INTERNATIONAL BANK FOR RECONSTRUCTION AND DEvelopment; North Atlantic Treaty Organization.)

(M. H. St.)

Education.—Schools (Dec. 31, 1949): elementary: infant 4,050, pupils 289,791; primary 8,714, pupils 768,283; adult 370, pupils 5,863; secondary: state lower-grade 97, pupils 43,772; higher grade 157, pupils 46,729; Catholic 463, pupils 66,633; teachers' colleges: infant 39, students 1,582; elementary 81, students 8,814; secondary 38, students 1,304; universities (1949–50): 4, students 16,425.

Finance and Banking.—Budget: (1951) revenue 73,400,000,000 fr., expenditure 68,300,000,000 fr.; (1952 est.) revenue 70,500,000,000 fr., expenditure 70,500,000,000 fr. National debt (Aug. 1951): 246,970,000,000 fr. Currency circulation (July 1951): 94,600,000,000 fr. Gold and foreign exchange (Aug. 1951): U.S. $935,000,000. Bank deposits (June 1951): 64,700,000,000 fr. Monetary unit: Belgian franc with an exchange rate (Sept. 1951) of 50.50 fr. to the U.S. dollar.

Foreign Trade.—(Belgo-Luxembourg Economic union, 1950): imports 97,500,000,000 fr.; exports 82,572,000,000 fr. Main sources of imports: U.S. 16%; France 11%; the Netherlands 10%; U.K. 8%. Main destinations of exports: the Netherlands 22%; France 9%; U.K. 8%; U.S. 8%. Main imports: machinery and vehicles 14%; raw wool and cotton 13%; grains 6%; coal, petroleum and products 6%. Main exports: iron, steel and manufactures 19%; thread and fabrics 15%; nonferrous metals and manufactures 11%; machinery and vehicles 9%.

Transport and Communications.—Roads (1949): 6,648 mi. Licensed motor vehicles (Dec. 1950): cars 273,599; commercial 144,566. Railways (1950): 3,128 mi.; passenger-miles 4,377,000,000; freight ton-miles 3,393,000,000. Shipping (July 1950): merchant vessels of 100 gross tons and over 222; total tonnage 481,656. Navigable waterways 969 mi. Air transport (1950): passenger-miles 146,000,000; cargo ton-miles 5,257,000. Telephones (Dec. 1949): subscribers 471,705. Radio receiving sets (1949): 1,374,400.

Agriculture.—Main crops (metric tons, 1950): wheat 547,000; barley 260,000; oats 503,000; rye 238,000; potatoes 2,309,000; sugar, raw value 445,000; linseed 12,000; rapeseed 3,000. Livestock (Jan. 1951): cattle 2,020,000; sheep 116,000; pigs 1,234,000; horses 247,000; goats 55,000; poultry 16,500,000. Dairy production (1950): butter 73,000 metric tons; milk 3,452,000,000 l. Meat production (1950): 318,000 metric tons. Fisheries (1949): total catch 68,300 metric tons.

Industry.—Industrial establishments (Jan. 1948): 248,128; persons employed 1,000,010. Fuel and power (1950): coal 27,300,000 metric tons; manufactured gas 1,446,000,000 cu.m.; electricity 8,484,000,000 kw.hr. Raw materials (metric tons, 1950): pig iron 3,696,000; steel ingots and castings 3,768,000; copper smelter 137,000; lead 62,000; zinc 177,000; tin 10,400; aluminum 1,900. Manufactured goods (metric tons, 1950): cement 3,552,000; woven cotton fabrics 74,000; cotton yarn 98,000; wool yarn 40,000; rayon filament yarn 9,800; paper and cardboard 301,200.

Benton, William

(1900–), U.S. senator and publisher, was born on April 1 in Minneapolis, Minn. He was graduated from Yale university in 1921. In 1929, in partnership with Chester Bowles, he founded the advertising agency of Benton and Bowles.

Benton retired from the agency in 1936, and in 1937 became vice-president of The University of Chicago, on a part-time basis. At his instance the university acquired Encyclopædia Britannica, Inc., in 1943. He financed the company, became chairman of its board and shared its ownership with the university. He launched the company into the classroom motion-picture field and served as chairman of Encyclopædia Britannica Films Inc. During this period, in collaboration with Paul Hoffman, he helped to found the Committee for Economic Development, and he was active in inter-American affairs.

Benton was appointed U.S. assistant secretary of state by Pres. Harry S. Truman on Aug. 31, 1945, and served until Sept. 30, 1947. He developed the country's first peacetime program of international information and educational exchange and took responsibility for U.S. participation in the United Nations Educational, Scientific and Cultural organization.

In Dec. 1949 Benton was appointed U.S. senator from Connecticut to succeed Raymond E. Baldwin, resigned; in the Connecticut election of Nov. 7, 1950, he was returned to the senate for two more years. His first two years in the senate were marked by his campaign in behalf of a "Marshall Plan of Ideas," by his vigorous espousal of the Hoover commission recommendations on government reorganization and by his activities on behalf of small business. In 1951 he secured the adoption of the "Benton amendment" to the Mutual Security act, which instructs the administrator of that program to oppose cartels and Communist-dominated unions abroad; made proposals to strengthen anticorruption laws; and introduced a resolution calling for expulsion of Sen. Joseph McCarthy of Wisconsin, following criticism by a senate committee of McCarthy's role in the 1950 Maryland campaign. This resolution was under committee study at the year's end. Berlin.

Capital of the German reich from 1871 to 1945, Berlin was still by 1951 the largest city of Germany. Area: 343.6 sq.mi. Pop.: (1939 census) 4,321,500; (1946 census) 3,180,300, or 26.4% less. From June 6, 1945, to June 24, 1948, Berlin was administered by an inter-Allied government authority (in Russian, *Kommandatura*) consisting of the commandants of the four sectors of Berlin. After June 24, 1948, when the soviet commandant proclaimed the dissolution of the *Kommandatura*, Berlin was in fact divided into two opposing administrations. By Dec. 31, 1951, the three western sectors (pop., *c.* 2,500,000) were under the authority of the three following Allied commandants: Great Britain, Maj. Gen. C. F. C. Coleman; United States, Brig. Gen. Lemuel Mathewson; France, Gen. Pierre Carolet. In the soviet sector (pop., *c.* 900,000) the civil administrator was Serghey Dienghin, with A. F. Susin as deputy. There were also two rival German city governments and two lord mayors; Ernst Reuter was *Oberbürgermeister* appointed by a city assembly elected by the population of the three western sectors; Friedrich Ebert was provisional *Ober-*

WEST BERLIN POLICE using a hose on young Communists after an attempted propaganda invasion of the U.S. zone by delegates to the soviet-sponsored world youth festival in Aug. 1951

bürgermeister of the soviet sector appointed by a meeting summoned by the Sozialistische Einheitspartei Deutschlands.

History.—By the end of 1951 west Berlin was still not included as the 12th *Land* in the Federal Republic of Germany, but it had 19 nonvoting deputies in the Bonn parliament, instead of 8. The extra 11, chosen according to party strength, were: 4 Socialists, 4 Free Democrats and 3 Christian Democrats. Ernst Reuter was re-elected *Oberbürgermeister* by 77 out of 125 votes on Jan. 18, even though his party, the Socialist, did not have the absolute majority.

Attempts by soviet and eastern German authorities to "needle" west Berlin, particularly to upset its normal trade communications with the west, continued. Interference with interzonal waterways traffic was settled on May 4, and holding up of mail to and from western Germany on Sept. 6. The sudden introduction of an excessive *Autobahn* tax for western German and west Berlin transport using the special international highway between Berlin and Helmstedt (British zone) lasted three weeks (Sept. 1–21); then the tax was considerably reduced.

In February soviet authorities took over West Staaken, a small village on the outskirts of the British sector. Though technically belonging to the soviet zone since 1945, it had been included in the administration of Berlin-Spandau. Eastern German police seized in October the hamlet of Steinstücken, 1 mi. beyond Zehlendorf and administratively under that suburb. When the U.S. commandant protested, the soviet authorities ordered their police to withdraw.

West Berlin's main problem was still economic. At the end of November the number of unemployed was 265,000, and more than 25% of these were between the ages of 14 and 30 years, thus constituting a great social problem. Industrial production, as compared with that at the end of the blockade (May 1949), had almost trebled by the summer of 1951, but the production index still lagged far behind that of western Germany. It was still only 50% of that for 1936, whereas for western Germany it was 35% above. West Berlin was well equipped to meet the demands for electrical goods of all sorts, precision and optical instruments, pharmaceutical products, etc. About 75% of the 1951 exports went to European countries and the rest overseas.

Investments for creating employment amounted to 706,900,000 DM. in 1949–50, and to 953,000,000 DM. in 1950–51; 166,900,000 DM. and 273,000,000 DM., respectively, were from foreign sources. Budget deficits under the abnormal conditions prevailing were the rule. The German Federal Republic promised at the end of October an additional 550,000,000 DM. monthly from the *Notopfer Berlin* funds to help to tide over these difficulties. On Sept. 28 Reuter outlined a seven-point program of the Berlin senate which included political incorporation of west Berlin in the federal republic, greater financial credits for industry, building schemes, security of unhindered traffic to and from the city and other matters.

In addition to the usual unemployed, the escape to the western sectors of the city of about 3,000 refugees monthly from the soviet zone was a serious strain on resources. Though only about 25% of these were accepted as genuine political victims, nevertheless these had to be fed and housed until transferred to western Germany.

Despite its difficulties, west Berlin had done much to clean and improve its general appearance. Great improvements were noticeable in the streets and parks, and many international exhibitions were organized, particularly the September Festival of Music and Drama, which rivalled many of those of prewar days. An exhibition of a different sort was that of German industry (Oct. 6–21).

An outstanding U.S. gift, announced on July 17, was that of $1,309,500 from the Ford foundation to the Free University of Berlin for building a central library and a students' dining hall. (By 1951 this university had 2,000 students.)

East Berlin moved very slowly, with little of importance to record. The 1951 youth festival brought together about 1,500,000 members of the Free German Youth (Freie Deutsche Jugend). Most of them were from Communist-controlled areas, but about 11,500 crossed from the western zones of Germany. Unlike the 1950 festival, which was intended to demonstrate the strength of the movement among the youth, the 1951 festival was taken up with a program of sport and entertainment. But propaganda was not forgotten. Despite the efforts of the *Volkspolizei*, thousands of the members crossed over into west Berlin where they were welcomed by the people and carried back home views of the free world.

The east Berlin city council did little to improve the drab, shabby appearance of most of the city under its administration. The only exception was its principal street, Unter den Linden. There, the soviet embassy (completed after two years' work) stood out as a modern but much overdone structure. The former Lustgarten, renamed Marx-Engels square, was more than ever like a miniature Red square. In political, economic and cultural policies, east Berlin followed unquestioningly the line laid down by the eastern German Communist government. As the split in the city continued, it was surprising that in so many services which the eastern and western sectors shared in common (*e.g.*, transport) conditions were so near normal. (J. E. Wi.)

Bermuda.

Bermuda is a British colony of about 300 small islands 580 mi. E. of Cape Hatteras, N.C. Area: 21 sq.mi. Pop. (1950 census): 37,254. Chief towns: Hamilton (cap., *c.* 3,500); St. George (*c.* 1,300). Governor in 1951: Lieut. Gen. Sir Alexander Hood.

History.—The royal naval dockyard closed on March 31, 1951, as expected, although Bermuda remained the base of the American and West Indian squadron. No definite plan materialized for the solution of the problems caused by the closing of the dockyard. A commission which investigated the growth of population and illegitimacy recommended that steps be taken at once to restrict population growth. Plans for developing a commercial tuna fishing industry centred on Bermuda were discussed at the Bermuda Oceanic Fisheries conference.

Education.—Schools (1949): aided 27 (attendance 5,701); attendance at private schools, 1,251.

Finance and Trade.—Currency: Bermuda pound (at par with sterling). Budget (1950): revenue £2,009,463; expenditure £1,969,022. Foreign trade (1950): imports £8,208,376; exports £962,646. Principal exports were cut flowers. The economy of the colony rested on the tourist trade. Tourists: (1950) 71,260, including 61,654 from the United States; (first eight months of 1951) 73,000. (Jo. A. Hn.)

Betting and Gambling.

Two groups—the senate crime investigating committee in the United States and the Royal Commission on Betting, Lotteries and Gaming in Great Britain—devoted many months of 1950–51 to the gambling problem, and each was ready with a report in 1951.

The senate crime investigating committee, headed by Sen. Estes Kefauver of Tennessee, estimated that illegal gambling in the United States totalled $20,000,000,000 annually. It recommended legislation that would ban interstate transmission of racing information and other sporting odds and results, and also proposed that the bureau of internal revenue compel gamblers to keep detailed records of winnings and losses, and forbid them to deduct losses and business expenses from their income taxes.

However, the Federal Communications commission would not undertake to police such dissemination of information, and some legislators maintained that to cut off racing news service, for example, constituted an abridgment of freedom of the press.

There was some support for legalization of gambling, but prosecutors opposed such legalization, their opinion being that it might reduce corruption at the police and ward politician level but that it would force a rise in corruption at higher levels.

The legislation resulting from the investigation in the U.S. required gamblers, on or before Nov. 30, 1951, to register with their district collector of internal revenue, to pay a tax prorated at $50 per year, and thereafter to collect and remit as tax 10% of their gross receipts. On Dec. 4 the internal revenue bureau announced that 7,706 individuals in the United States had registered as gamblers. This figure might be compared with an estimated 15,000 bookmakers in New York city alone.

At the end of the year, U.S. gamblers were "lying low." Their opinion seemed to be that the country was momentarily heady with reform emotionalism, but would get over it, and that they would survive it as they had survived other antigambling crusades.

The sale of "scratch sheets" lessened by 40% to 90% in most large cities. The arrest of bookmakers decreased by more than 80%.

In the drive against gambling, racing received the greatest attention because at least some betting on horse races was legal in a majority of the states. Racing men, however, contend that as much or more money was bet on baseball, basketball, football and elections.

A Gallup poll showed that 57% of the population of the U.S. gambled, however mildly, and that their preference in gambling (in order) was bingo or raffles, cards, punchboards, sporting contests, slot machines, horse racing, sweepstakes, elections and the numbers game.

A similar survey in Great Britain showed that 80% of the adult population gambled. (M. Ber.)

Great Britain.—The commission held 25 meetings for hearing oral evidence and 17 meetings for discussion, and they heard evidence from 141 witnesses.

The commission stated as a principle that: "It is the concern of the state that gambling, like other indulgences such as the drinking of alcoholic liquor, should be kept within reasonable bounds, but this does not imply that there is anything inherently wrong in it." And in support of the commission's suggestion that the state should control gambling as it does drinking, while making no attempt at prohibition, its proposal that betting shops for off-the-course cash bets should be allowed under licence and strict police control, seemed to be a moderate encouragement to gambling rather than a deterrent. But this proposal was favoured by every witness with practical experience of the enforcement of present laws, only the bookmakers' associations and the churches' committee, in unusual alliance, being opposed to it.

On football pools the commission proposed that any one prize "must not exceed a specified amount." It did not specify a particular sum, but said, "We think that the limit should not be higher than £20,000, but that it would not be reasonable to make it less than £10,000." The commission would prohibit abbreviated permutations, and recommended that any commission, expenses, or other amount (taxation) charged by the promoter against the gross stakes must be charged against the total stakes in each pool in the proportion which the total stakes in that pool bear to the gross stakes. The total amount paid to winners in any pool must be equal to the total stakes in that pool, less any amount deducted in accordance with the preceding recommendation, and they may not be supplemented from any other source.

The commission made proposals about amusement arcades, dog racing, lotteries and competitions and totalizator betting. It was, however, on the publication of information relating to gambling that the commission's proposals were of importance. It found that the net expenditures on gambling was approximately £70,000,000 a year, a figure far less than that given by the churches' committee. "Figures of the total stakes in all forms of gambling must give a wholly misleading picture of the importance of expenditure on gambling as a whole." In comparison with the amounts spent on tobacco, drink or entertainment the total amount spent on gambling was about 8% of the total personal expenditure. The commission stated that the total number of persons employed full time or working on their own appeared to be 47,000 and the number of part-time employees about 30,000. (H. C. La.)

Bevan, Aneurin

(1897–). British politician, was born at Tredegar, Monm., Eng. He was educated at Serhowy elementary school. The son of a miner, he started work as a collier's helper at 13, was chairman of a miner's lodge before he was 19 and in 1921 led unemployed miners seeking help from the Poor law authorities. After studying at the Central Labour college, London, he threw himself into local politics, first as a member of the Tredegar urban district council and, in 1928, as a county councillor.

He was elected to the house of commons for Ebbw Vale, Monm., in 1929. Throughout World War II he was a bitter and unrestrained critic of Winston Churchill's coalition government. But he was equally outspoken within his own party and in 1939 was expelled, along with Sir Stafford Cripps, for taking part in the popular front movement; he was readmitted, however, later in the year. Elected to the Labour party executive in 1944, he headed the poll in the elections to the executive every year from 1946.

As minister of health in Clement Attlee's government of 1945, Bevan was responsible for setting up the national health service as well as having charge of the housing program. He became minister of labour and national service in Jan. 1951, but in April resigned from the government, along with Harold Wilson, president of the board of trade, because he disagreed with the scale of rearmament budgeting and with the apportionment of the burden of expenditure among the different social classes; he said, however, that he and his supporters in the house of commons would do nothing to contribute to the defeat of the Labour government.

In the general election of Oct. 25, 1951, Bevan was again returned for Ebbw Vale. (R. Jan.)

Bhutan.

An Indian-protected state on the borders of Tibet. Area: *c.* 18,000 sq.mi. Pop. (1950 est.): 300,000, chiefly Bhotias. Language: a dialect of Tibetan. Religion: mainly Buddhist. Capital: Punakha. Ruler: Maharaja Jigme Wangchuk.

History.—Despite the approach of Chinese troops to the northeastern frontier—they reached Tsona Dzong in August—the year 1951 was uneventful. Implementing promises made at the time of signing the Indo-Bhutan treaty of 1949, the Indian parliament on Aug. 8 passed a bill ceding to Bhutan a strip of territory (32.81 sq.mi.) known as Dewangiri, hitherto included in Assam. The cession had been approved by the Assam legislature on March 27. Bhutan's original claim was for a much larger area but eventually the two parties agreed on the tract selected. This gesture helped to cement the cordial relations existing between the protectorate and India. (E. Hd.)

Billiards. Willie Hoppe in 1951 won his tenth world three-cushion championship since 1936 and his seventh in succession. The 63-yr.-old Hoppe, who captured his first universal title in 1906, showed that he had lost none of his skill by breezing unbeaten through the tournament at Chicago, Ill., with six consecutive victories.

Hoppe's opposition consisted of Joe Chamaco of Mexico City, Art Rubin of Brooklyn, N.Y., and Joe Procita of Los Angeles, Calif., who finished in that order in the 1951 national championship. Chamaco, with a 4–2 record, finished second in the world tourney and the other two had identical 1–5 records.

Willie Mosconi of Haverford, Pa., retained his world pocket-billiard crown, also with six straight triumphs. Mosconi clinched honours by defeating George Chenier, the Canadian champion, and Joe Canton, the newly crowned national titleholder, in his last two contests. The fourth competitor was Irving Crane, the 1950 national champion.

Ed Lee of the New York Athletic club won his tenth national amateur three-cushion crown by turning back Robert Michael, Cleveland (O.) Athletic club, 50–39, in a three-hour 83-inning play-off match.

Larry Gray of the University of Michigan, Ann Arbor, annexed the intercollegiate three-cushion championship and Leroy Kinman of Eastern Kentucky State college, Richmond, won the pocket competition for the third year in a row. Conrado Roa of Michigan was the victor in the straight-rail contest.

Salvatore Attardi of New York city was the 1951 Boys' Clubs of America senior champion and Robert Legg of Princeton, Ind., romped off with the junior laurels. The team title went to the Tompkins Square Building unit of New York city. (P. Br.)

Biochemistry. **Amino Acid Sequence in Insulin.**—The mechanism by which proteins exert their biological action received much attention during 1951. One of the primary goals in this field had been to learn more of the structure of proteins. Work in past years had revealed a great deal of the amino acid composition of proteins and of the size and shape of these large molecules. However, two major problems remaining unsolved were: (1) the sequence of the different amino acids in the peptide chain; and (2) the manner in which the peptide chain is folded and held together to give a specific configuration.

A very notable advance in this field was the publication of the amino acid sequence in the B chain of the protein hormone insulin by F. Sanger and H. Tuppy. Insulin was chosen for this work because it seemed a relatively simple polypeptide to analyze when compared with other proteins. The results indicated that crystalline insulin was a large molecule composed of six to eight identical subunits each having a molecular weight of around 6,000. These subunits were found to consist of two different polypeptide chains (A and B) linked together by two disulphide bonds (-S-S-). These disulphide bonds were broken by gentle oxidation. The two chains were separated from each other by virtue of the fact that chain A is acidic, containing no basic amino acids, while chain B, on the other hand, contains many basic amino acids. Chain B, a polypeptide of 30 amino acids residues, contains only 15 different amino acids. For a structure containing this number of amino acids it can be computed that at least 5 x 10^{27} isomeric sequences can exist.

LIGHT for this picture came entirely from fireflies, luminous insects studied by biochemists investigating chemical, or "cold," light in 1951. Pinpoints in the child's eyes reflected insect flashes from about 75 fireflies in a pickle jar (left) during a two-minute exposure

Sanger and Tuppy identified every bond in the natural occurring polypeptide. Chain B was partially hydrolyzed by a variety of procedures to yield mixtures of di-, tri-, tetra- and even larger peptides. This was done by the use of acid or alkali at room temperature and by a number of proteolytic enzymes including pepsin, chymotrypsin and trypsin. These peptides were separated from each other by such newly developed analytical techniques as filter paper chromatography, ion exchange chromatography, adsorption analysis and ionophoresis. The actual structure of the individual peptides was then determined by means of the reagent 2,4-dinitrofluorobenzene which reacts with the free amino groups to form a stable derivative. The composition of each peptide could thus be determined. Since the different hydrolytic procedures break different bonds in the polypeptide the identification of all the individual peptide structures made it possible to derive the sequence of the amino acids in the B chain. Using Sanger's notation and the standard abbreviations for the amino acids, the complete amino acid sequence in the B chain of insulin is: phe . val . asp . glu . his . leu . cys . gly . ser . his . leu . val . glu . ala . leu . tyr . leu . val . cys . gly . arg . gly . gly . phe . phe . tyr . thr . pro . lys . ala.

Protein Structure.—An important contribution to the theory of protein structure was made by L. Pauling and R. B. Corey. Data from X-ray diffraction analysis was used as a basis to suggest spacial arrangements in which the polypeptide chains in various proteins are organized. According to these workers the α-keratin type of protein structure which is found in fibrous proteins such as unstretched hair, horn and contracted myosin (a protein component of muscle) can be pictured in the following manner. The peptide chain exists in the form of a helix. This structure is held in place by hydrogen bonds which are formed between all the carbonyl groups of the peptide bonds and the NH groups of the peptide bonds three residues away along the chain. This hydrogen bonding extends across nearly a complete turn of the helix and determines the actual configuration of the structure. Pauling calculated that there are 3.7 amino acids per turn of the helix and that the distance between the side chains of adjacent amino acids is 1.72 A. The organization of the polypeptide chains in stretched hair, silk and muscle proteins, or the β-keratin structure, is stated to consist of almost linear chains of the polypeptides in which the hydrogen bonding instead of being between amino acids in the same chain is between adjacent chains. In this extended structure the distance between the side chains of adjacent amino acids in the polypeptide is 3.32 A.

The suggestion was also made that the helical α-keratin type structure is found in nonfibrous or globular proteins. In these proteins the helix itself may be coiled in such a manner that the protein molecules may actually be round.

Carbohydrate and Fat Metabolism.—Investigations in 1951 clearly identified the "active" two carbon (C_2) intermediate which is formed during carbohydrate and fat metabolism. It had been found previously that pyruvate, acetate and the oxidation products of fatty acids are converted to common C_2 fragment which participated in such reactions as the formation of citrate or of acetoacetate. This active C_2 compound is apparently a derivative of coenzyme A. This coenzyme was discovered by F. Lipmann as an essential factor for enzymic acetylation reactions.

The mechanism by which acetate is condensed with oxalacetate to form citrate was not known until 1951. Since at least 50% of the energy in fatty acids is released when acetate is oxidized via the citric acid cycle, the details of the initial condensing step in this cycle were of considerable interest. It was demonstrated that both coenzyme A and adenosine triphosphate (ATP) were necessary to condense acetate and oxalacetate. The energy of the phosphate bonds of adenosine triphosphate is used to activate coenzyme A so that it can react with acetate to form acetyl∽CoA. Acetyl∽CoA in the presence of another enzyme can spontaneously condense with the 4 carbon acid oxaloacetate to form the 6 carbon acid, citrate. Acetyl∽CoA thus seems to be the metabolically active form of the C_2 fragment.

It was also found in the laboratory of S. Ochoa that pyruvate (which is formed from glucose) will also yield acetyl∽CoA. The reaction occurs in the presence of the proper enzymes and such cofactors as coenzyme I, thiamine pyrophosphate, etc., but does not require energy in the form of ATP. The fact that this reaction was shown to be irreversible could account for the fact that fat, although it can break down to yield acetyl∽CoA, cannot be used for the net synthesis of carbohydrate in the animal body. This acetyl∽CoA will then form citrate in the same manner as acetyl∽CoA formed from acetate. Since 80% of the total energy content of glucose is still retained in the pyruvate formed during glycolysis, the importance of these results can be readily appreciated.

Coenzyme A had been isolated from hog liver, moulds and various bacteria. Although this coenzyme had not yet been isolated in pure form, considerable information was available regarding its structure. Three major components were found: (1) pantothenic acid; (2) adenylic acid; and (3) an amine containing sulphur-mercaptoethanolamine. The pantothenic acid is linked to the mercaptoethanolamine by a peptide bond between the β alanine carboxyl group and the amino group, and to the adenylic acid by a phosphate bridge. The probable structure of coenzyme A is:

adenine-ribose-(P)-P-P-pantoyl-β alanine-mercapto-ethanolamine

The acetyl group of acetyl coenzyme A is linked to the sulphhydryl group at the end of the molecule.

It should be noted that pantothenic acid, a member of the vitamin B group, was discovered in 1933 and was found to be an essential dietary factor for animals. The discovery of its function as part of a coenzyme in an important metabolic reaction is a further illustration of the fact that most vitamins function as parts of enzymes or coenzymes.

Nucleic Acids.—Some progress was made in understanding the biological significance and the chemistry of the nucleic acids which occur in all cells. Desoxyribonucleic acid (DNA) was found to be intimately concerned with self-replicating structures such as nuclear genes, viruses and with certain substances known as "transforming principles." The transforming principles cause hereditary changes in microorganisms when added to the growth medium.

With the advent of refined analytical techniques, it was shown that the DNA concentration in a cell is directly proportional to the number of chromosomes; *i.e.*, a sperm cell has only half the amount of DNA as the majority of body cells containing diploid nuclei. In different tissues of the same species the DNA appears to have the same composition. However, in different, but even closely related, species the DNA composition is different. From these and other facts it appeared that DNA might be "the hereditary code-script of living material." (*See* also PHYSIOLOGY.)

Birth Control.

During 1951 the Planned Parenthood Federation of America appointed William Vogt, conservationist and ecologist, as its national director. Prime Minister Jawaharlal Nehru of India during the year declared that birth control was essential to the national well-being of his country. His government implemented this policy by requesting assistance from the World Health organization of the United Nations in initiating a population control program. Abraham Stone, federation vice-president, was designated to make a pilot project in India under W.H.O. auspices and Indian government sponsorship. He worked through local health centres, with control groups of illiterates as well as educated Indians who were taught family control methods requiring no artificial appliances.

The third meeting of the International Committee on Planned Parenthood took place in London, Eng., to plan a world conference on planned parenthood. Lady Rama Rau, founder and president of the Indian Family Planning association, invited the committee to hold its meeting in India in 1952 under the association's sponsorship, to facilitate the attendance of far easterners concerned with their countries' pressing population problems.

Awards.—The seventh annual Albert D. and Mary Lasker Foundation Awards in Planned Parenthood went to two authorities on world population problems. They were William Vogt and Guy Irving Burch. Vogt was cited for "his investigations in the field of conservation and his achievement in bringing world population problems home to a vast number of people." Burch, founder and director of the Population Reference bureau, Washington, D.C., and coauthor of *Human Breeding and Survival*, was recognized posthumously because "perhaps more than any other individual he was responsible for today's awareness of the population problem and the need for positive action to resolve it."

Research.—One of the serious gaps in the effort to make planned parenthood available to families everywhere had been the lack of a simple, low-cost contraceptive that could be safely used by illiterate, poverty-stricken mothers in overcrowded parts of the world. In an effort to co-ordinate and promote the research required to discover such a contraceptive, the federation established the Robert L. Dickinson Research memorial in 1951. The memorial, which was sponsoring basic research in the almost unexplored field of human reproduction, was established as the federation's tribute to Dickinson, distinguished medical birth control pioneer. Four research projects were sponsored during the year by Dickinson memorial grants, as approved by the federation's medical committee and the advisory committee of the memorial.

Clinical and laboratory research in contraception and other phases of human fertility were also carried on during the year at the Margaret Sanger Research bureau, New York city.

The Planned Parenthood federation was in 1951 the national agency and clearinghouse for 12 state leagues and 100 local committees. Birth control clinics numbered 517. These services were in 274 public health departments, 48 hospitals and 173 extramural clinics, and there were 22 referral services. Of the 157,174 yearly total of patients visiting birth control clinics in 1950, 143,565 were served in extramural clinics sponsored by federation affiliates. The seven states which included birth control in their public health programs were: Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina and Virginia. The known infertility clinics in the country were 66 of which 13 were under Planned Parenthood federation auspices. (M. Sr.)

Birth Statistics.

After three years of continuous decline from the postwar peak in 1947, the birth rate in the United States rose again in 1951. For the first nine months of that year, the birth rate was 5.1% higher than for the like period of 1950. For the whole of 1950, the number of recorded births was estimated at 3,548,000, and the birth rate at 23.5 per 1,000 population. An allowance for unrecorded births raised the estimate for 1950 to 3,699,000 births, and the rate to 24.5 per 1,000. This was 26.3% above the corresponding rate of 19.4 per 1,000 for 1940. Canada also experienced a rise, 4.6%, in its birth rate from 1950 to 1951, according to provisional data covering the first eight months of both years. For the entire year 1950, Canada, including Newfoundland, recorded 370,578 births, with a rate of 26.8 per 1,000 population.

Contrary to the experience of the United States and Canada, provisional birth records for the urban communities of England and Wales show a 2.3% decline for the first ten months of 1951 from the like period of 1950. Altogether, that country had 691,752 births for all of 1950 and a birth rate of 15.8 per 1,000 population. Thus, England and Wales had been experiencing a steady decline in birth rate since 1947. The European populations of New Zealand and of the Union of South Africa had been undergoing a similar experience, with a 1950 birth rate of 24.6 per 1,000 population for the former country and 25.7 for the latter. The birth rate for 1950 was the lowest since 1947 for Austria, Belgium, Finland, western Germany, Italy, the Netherlands, Norway, Spain, Sweden and Switzerland. High birth rates in 1950 were reported for Costa Rica (46.9 per 1,000), Dominican Republic (47.7), Guatemala (49.0) and Puerto Rico (38.5).

Although the birth rate for the total population of the United States generally tended downward after the peak year 1947, this decline was not shared by the nonwhite population. There was a rise in the nonwhite birth rate from 28.2 per 1,000 in 1947 to 30.3 in 1949, while the white population had a drop from 25.5 to 23.2. The nonwhite birth rate in 1949 was almost one-third greater than the white birth rate. Further differentials in characteristics and trends over the period 1947 to 1949 are shown in the table.

Births per 1,000 U.S. White and Nonwhite Females of Stated Ages and Order of Birth

Age and order of birth	White 1949	White 1948	White 1947	Nonwhite 1949	Nonwhite 1948	Nonwhite 1947
	Births per 1,000 females of stated ages					
10–14	0.4	0.4	0.3	4.4	4.3	4.1
15–19	71.6	70.4	68.6	149.8	144.8	134.2
20–24	190.5	189.5	199.9	226.2	218.2	201.6
25–29	163.6	161.8	176.6	157.4	148.3	137.9
30–34	100.2	101.7	110.2	94.1	89.4	85.8
35–39	51.7	52.5	57.0	60.3	59.2	59.7
40–44	14.3	14.8	15.7	19.3	17.9	17.8
45–49	1.0	1.0	1.1	1.7	1.9	2.0
	Births of stated order per 1,000 females of ages 15–44					
First	36.3	39.7	47.3	33.6	35.3	35.8
Second	32.2	30.8	30.3	29.1	27.6	24.1
Third	16.6	15.4	15.0	19.8	17.9	15.6
Fourth	7.8	7.3	7.2	13.0	11.8	10.8
Fifth	3.9	3.9	3.9	9.0	8.3	7.8
Sixth and seventh	3.7	3.6	3.7	11.2	10.5	10.1
Eighth and over	2.6	2.4	2.5	10.7	10.1	10.0

The drop in the birth rate among white women from 1947 to 1949 was confined to those at ages 20 and over; at ages under 20 years the rate actually rose. For nonwhite women, the rate rose at all ages up to 45 years; only at ages 45 to 49 years, where the rates are very low, was there a decrease. With regard to order at birth, white women showed a downward trend only in the rate for first children. The white rates increased for the second, third and fourth children, while for higher orders they were stationary. In the case of the nonwhites, the rates for first children also declined, but for all higher orders there were increases from 1947 to 1949. Since the trend in the birth rate for first children is so closely associated with that for the marriage rate, it was evident that the postwar decline in the birth rate for the total population was influenced very largely by the fall in the marriage rate from 1946 to 1948.

As a result of the more rapid rise in the birth rate in urban centres than in rural areas from 1940 to 1949, the margin between the two narrowed. Thus, the urban rate per 1,000 women at ages 15 to 44 years, after allowing for under-registration, rose from 67.8 in 1940 to 102.4 in 1949, an increase of 51.0%. For rural areas, the corresponding rise was from 98.7 to 122.8, or by 24.4%. However, the drop from 1947 to 1949 was more rapid in urban than in rural areas, the decreases being 5.3% and 3.7%, respectively. In 1949 the rural rate was 20% higher than the urban rate.

On the whole, the drop in the birth rate from 1947 to 1949 was most rapid in those sections of the country that had the most rapid increases from 1940 to 1947. For example, the New England and middle Atlantic states had increases of 55% from 1940 to 1947, but from 1947 to 1949 the respective decreases were 14.0% and 12.2%. For the country as a whole, the early gain amounted to 44.1% and the subsequent decrease to 7.0%.

The proportion of births attended by a physician in a hospital continued to rise, reaching 86.7% in 1949; 8.1% were attended by a physician not in a hospital; and 5.1% by a midwife or other not specified person. Despite the favourable showing for the country as a whole, the record among the nonwhites, though improving, was still relatively unfavourable. Whereas 91.6% of the white births in 1949 occurred in a hospital, for the nonwhites the figure was only 55.1%. On the other hand, the nonwhites had 29.0% of their births attended by a midwife or other person, compared with 1.4% for white births. However, in some sections of the country, the record for hospitalization of nonwhite births was almost as good as that for white births. For example, in New England the proportion of births attended by a physician in a hospital was 97.7% for the whites and 97.3% for the nonwhites. Likewise, for the Pacific coast states the respective figures were 98.5% and 96.4%. At the other extreme, the 1949 record shows that in the east south central states only 72.8% of the white births and 28.1% of the nonwhite births were attended by a physician in a hospital. A detailed inspection of the record for the proportion of births occurring in a hospital showed particularly low figures for the rural nonwhites in several states; for example Arkansas had only 11.8%, South Carolina 12.4%, Mississippi 13.1%, Georgia 14.2% and Alabama 15.0%.

From a study of birth registration data of the United States, C. A. McMahan (Milbank Memorial fund *Quarterly,* July 1951) concluded that the sex ratio at birth was hardly influenced by the two World Wars. In support of this, he showed that the ratio of males to females at birth tends to decrease with advance in the age of the mother and that among first-born children the proportion of males tends to be higher than in later births. This led to the conclusion that the rise in the ratio of males to females at birth during World War II reflected essentially the larger proportion of births to young mothers at that time.

On the basis of data collected in a survey made in Indianapolis, Ind., L. F. Herrera and C. V. Kiser (Milbank Memorial fund *Quarterly,* July 1951) found that the proportion of couples with planned families did not rise with decreasing health status. They related the poor health of wives and children, in large families, to their high fertility and poverty. (*See* also CENSUS DATA, U.S.; INFANT MORTALITY.) (M. SP.)

Blind, Education of the.

The expansion in services providing for the education of the blind was great during 1951. A number of new schools for blind children were established in several countries, including three in Egypt (two government and one private), one state school in South Kanara district, India, and a small school in Guayaquil, Ec., largely financed by the local Lions club. In Turkey, responsibility for the education of blind children at the school at Izmir was turned over to the ministry of education by the ministry of health, the existing school at Istanbul was being enlarged and a new school was soon to be opened at Ankara.

An increasing number of foreign students were being received in the United States to gain instruction in techniques for the education of the young blind. In a statistical study concerning the young blind throughout the world, made early in 1951, 17 countries (of 35 reporting) stated that the education of the blind child was compulsory.

In the United States, as of Jan. 1, 1951, there were 5,710 blind pupils registered in 52 residential schools and 985 blind pupils registered in 30 public school classes for the blind. Approximately 8,000 partially visioned children were being educated in 676 sight-saving classes in 241 cities in 37 states, the District of Columbia and Hawaii. The annual congressional appropriation of $125,000 was again made to the American Printing House for the Blind, Louisville, Ky., for the purpose of providing the schools and classes for the blind throughout the country with their braille books and magazines, talking books, large-type books and tangible apparatus. On Jan. 15 a bill was introduced into congress requesting an increase in the authorization for this appropriation to a total of $260,000 annually.

In Canada, education, including the education of blind children, is the responsibility of the ten provincial governments. The five schools existing in 1951 (two government and three private) were supported by public funds or received grants from the provincial governments for their individual pupils.

BLIND OARSMEN on the 1951 crew of the New York Institute for the Education of the Blind training aboard a barge in the Harlem river before their first race against sighted competition

A study of programs for preschool blind children in the United States, made by the American Foundation for the Blind, New York, N.Y., showed that at least 45 schools and agencies for the blind were providing some type of service on behalf of this group of children. A number of schools for the blind conducted two- to three-day regional conferences of classroom teachers of the blind, and on Nov. 19–20 the division for the blind, Library of Congress, Washington, D.C., held a national conference on library service for the blind, including a complete review of the problems incident to manufacturing and circulating books to the blind. Ten universities and colleges or special agencies for the blind conducted special courses in 1951 for the training of teachers and of workers with blind children and adults.

The braille system itself came in for a considerable amount of revaluation and development. The United Nations Educational, Scientific and Cultural organization, following up its 1950 conference on world braille which laid down the principles for internationalizing the braille system to all languages and notations (including mathematics, music and science), initiated two important regional conferences, the first at Beirut, Leb., in February, at which time a uniform system for the extensive region covered by the Perso-Arabic, Indo-Aryan and Dravidian, Sinhalese, Armenian and Malayan languages was worked out, and another in Montevideo, Urug., in November at which uniform systems of braille contractions were formulated for the Spanish and Portuguese-speaking peoples. Through the help of the American Foundation for Overseas Blind, a braille printing plant was set up in Jordan for the publication of books in Arabic braille, and additional equipment was provided for Brazil to enable it to expand its production of Portuguese-language textbooks.

Early in 1951 the United Nations opened within its New York secretariat a section for the rehabilitation of the physically handicapped to which was appointed a social affairs officer for the blind. This section was responsible for promoting and co-ordinating an international program for the physically handicapped, including the blind, in which the United Nations, its technical assistance administration and its specialized agencies were to participate. The U.N. also sponsored an international agreement between member states under which educational, scientific and cultural books and equipment, including apparatus specially manufactured for the blind for these purposes, were exempted from customs duties and other taxes and from currency restrictions, and this agreement had been signed by 24 countries, while 2 had ratified it. Ten states had to ratify the agreement before it became fully effective.

On the nongovernmental level, 1951 saw the creation of the World Council for the Welfare of the Blind, an international organization composed of leading workers for the blind from 19 countries. The council accepted as its education committee an international group of educators named by the International Conference of Workers for the Blind (held at Oxford, Eng., in 1949) as the sponsoring committee of the International Conference on the Education of the Blind to convene at the School for the Blind at Bussum, Amsterdam, Neth., July 25–Aug. 2, 1952. It was the goal of this conference that a means would be provided for ensuring the acceptance of minimum educational standards and the progressive improvement of services for blind children in all participating countries. (F. E. D.)

Blood, Diseases of.

ACTH (corticotropin, derived from the anterior pituitary) and cortisone (an adrenal cortical extract, Compound E), had left their imprint on many phases of medicine since their introduction first into experimental and then clinical use. Although the fundamental mechanisms by which these hormones act upon diverse bodily tissues remained obscure at the close of 1951, in the case of the blood-forming tissues and the blood cells, numerous "yardsticks" enabled evaluation of their activity. Thus, ACTH causes a simultaneous increase in the productivity of the cells of the bone marrow—*i.e.*, the red cells, the polymorphonuclear white cells and the platelets, and a decrease in the productivity or even a destruction of the lymphocytes. This might point to a reciprocal or antagonistic relationship between these two types of cell tissues. A curious effect is on the blood eosinophile which, under the influence of sufficient hormone therapy, disappears completely from the blood. This also occurs under conditions of extreme stress. As pointed out by Hans Selye, various types of stress (excitement, infections, physical injuries of various types) induce a simultaneous rise in the total number of white cells and in the polymorphonuclear cells, a drop in the lymphocytes, and a complete disappearance of the eosinophiles.

The deterrent or inhibitory effect of ACTH on the lymphocytes is associated with an effect on the production of antibodies which become materially reduced. Antibodies, which are usually helpful in fighting disease, are produced by the body in response to infections and at times by other mechanisms. Sometimes antibodies are produced in excess or are actually harmful. One type of abnormal and harmful antibody response occurs with the development of anti-red cell antibody. This development results in injury to the red cell and thus in haemolytic anaemia. The possibility was conceived that ACTH might diminish antibody production and thus stop the haemolytic disease. This actually ensued, with the result that the treatment of one type of haemolytic anaemia, *i.e.* the acquired form, was actually revolutionized. Whereas previously, surgical removal of the spleen (splenectomy) and transfusions were the only modes of therapy available, by 1951 almost all cases showed either a partial or complete response to ACTH or cortisone. This occurs if the acquired haemolytic anaemia is either of unknown cause (idiopathic) or due to some fundamental disease as leukaemia. The abnormal antibody in the blood becomes greatly reduced and this is followed by a simultaneous decrease in the destruction of red cells and an increase in their production. The use of these hormones is without value in the hereditary types of haemolytic anaemia, in which the fundamental fault lies in the red cell structure, and not in an abnormal antibody mechanism.

The effect of ACTH in reducing the activity of lymphoid tissue was utilized in the treatment of certain types of leukaemia, particularly of the acute lymphocytic variety. Unfortunately, although the immediate results were often striking, they were temporary. A cure for leukaemia had not been forthcoming by the close of 1951, although the fact that temporary states of improvement might occur in the acute forms was remarkable in and of itself, and suggested that the problem might not be as hopeless as it seemed. The main hope in leukaemia would seem to be in determining the causative factors, rather than in a hit-or-miss attempt to find a cure.

Since ACTH is to some extent a marrow stimulating agent, it was tried in conditions in which marrow activity is depressed, as in aplastic anaemia. It was also used in thrombocytopenic purpura, a bleeding disorder in which the platelets in the blood are reduced. Some cases of both these conditions showed a favourable response to this form of therapy, but the results were inconstant and only occasional cases were benefited.

Certain diseases are apparently caused by the development of an immune reaction so out of proportion to what is needed that it does more harm than good. Thus, an immune reaction against a certain germ which invades the body is beneficial, but when there is overshooting, harm may ensue. This is seen, for example, in a certain type of bleeding condition known as Henoch-Schönlein purpura, in which the excessive immunologic build-up appears to result in injury to small blood vessels throughout the body, and thus to bleeding into the skin, the joints, the bowel and other tissues. In another form of purpura (black and blue spots, little blood spots or petechiae), called idiopathic thrombocytopenic purpura, the disorder may also be initiated as a reaction of immunity. There, the blood platelets are destroyed by some sort of mechanism which attacks the person's own platelets. This is the mechanism behind the disorder of acquired haemolytic anaemia, where the person acquires an immunity against his own red cells. These are then destroyed by the antibody produced by the tissues and which attacks his own red cells. In other unusual conditions known as periarteritis nodosa and disseminated lupus, a hyperimmune state seems to have been set up with the result that connective tissue throughout the whole body becomes involved. The relationship of these various phenomena of immunity to allergic states and to the steroid hormones mentioned is not quite clear. However, the administration of ACTH and cortisone often resulted in great benefit.

Sickle cell anaemia is a rather rare form of severe anaemia occurring almost exclusively in the Negro. Although it was known to occur in families, its hereditary features had been worked out only recently, thanks largely to the work of J. V. Neel. These studies indicated that the severe and even fatal sickle cell anaemia is an inherited disease which comes about through the mating of two persons, both of whom have a mild, usually unrecognized disorder known as the sickle cell trait. About 10% of all Negroes in the United States (12% to 20% in certain sections of Africa) have the sickle cell trait. These are apparently healthy but when their blood is exposed to an oxygen-free environment, as on a glass slide covered with a cover slip, the previously round red blood cells assume a crescentic or sickled shape.

A person with the sickle cell trait has the sickle cell gene, which is transmitted to his or her children in a Mendelian dominant fashion, *i.e.* one-half of the children will have this genetic abnormality. If, as occasionally happens, two persons both having the sickle cell gene marry, some of their offspring will have two sickle cell genes, *i.e.* they are homozygous. These are the people with sickle cell anaemia, the severe disease. Thus, sickle cell anaemia is transmitted from two parents, both of whom have the relatively unimportant trait.

The cause for the development of sickling in a red cell, which can be seen under one's eyes in a microscope, had long eluded investigators. Linus Pauling, a physical chemist, concluded that the fault must lie in an inherent (molecular) abnormality of the haemoglobin molecule. By using the methods of electrophoresis, he demonstrated that the haemoglobin of sickle cells migrated as a positive ion in an electrophoretic field as contrasted with the negative charge of normal haemoglobin. Individuals with the sickle cell trait were found to have a relatively small quantity (20%–40%) of this abnormal haemoglobin, while the red cell of patients with the severe anaemia contained about 80%–100% of this material.

Later studies showed that the abnormal haemoglobin formed crescentic shaped crystals in concentrated solutions, thus indicating quite clearly that the red cell sickles because of its content of peculiar haemoglobin. Karl Singer showed by other chemical studies that one can distinguish between the following three types of haemoglobin: N or normal, S or sickle cell and F or foetal. His studies indicated that patients with sickle cell anaemia have both S and F haemoglobins in their red cells, whereas those with the trait have S and N haemoglobin. It is possible that F haemoglobin makes up a large proportion of the red cell in a probably related disorder known as Mediterranean anaemia, which is seen in Italians, Greeks, Syrians, Portuguese, etc.

The discovery that the chemical compound haemoglobin may assume different forms and thus be responsible for the production of certain disease states was of fundamental importance, particularly in the study of hereditary anaemias. It was not entirely hypothetical to assume that further studies of the chemical abnormality might well result in an approach to successful treatment.

Bobsledding. Stanley Benham of Lake Placid, N.Y., and Pat Martin of Massena, N.Y., captured the North American two-man title at Lake Placid, N.Y., Feb. 17, 1951. Starting from the one-mile post on Mt. Van Hoevenberg, the winners made the four runs down in the total time of 5 min. 16.30 sec. to eclipse the former record of 5 min. 18.52 sec. set by a Swiss team in 1949.

The national Amateur Athletic union two-man championship was annexed by Larry McKillip and Henry Stearn of Saranac Lake, N.Y. McKillip piloted the sled home first in the total elapsed time of 5 min. 36.78 sec. The national four-man crown was won by the Lake Placid Sno Birds.

Although highly successful at home, Benham had to be content with second places in the world championships at L'Alpe d'Huez, Fr., Jan. 27–31. The first German teams to compete in a post-war world title event took both the two- and four-man laurels. Andreas Ostler and Lorenz Nieberl, with a winning time of 5 min. 11.94 sec., defeated Benham and Martin; then the German four-man sled piloted by Ostler led home Benham's U.S. team in 2 min. 24.98 sec. for two runs. Riding behind Benham were Martin, Jim Atkinson of Rome, N.Y., and James Sheffield of Lake Placid. (T. V. H.)

Bolivia. Bolivia is a landlocked republic in south central South America. Area: 416,040 sq.mi.; pop. (1950 est.): about 3,990,000. The legal capital is Sucre (est. pop., 1946, 32,000); the actual seat of government is La Paz (est. pop., 301,000). Other major cities (with pop. est.) include Cochabamba (80,000), Oruro (50,000) Potosí (40,000), Santa Cruz (33,000) and Tarija (27,000). Racial distribution is estimated to be 52.34% Indian, 27.5% mestizo, 13.08% white, 0.22% Negro and 6.85% unspecified. Religion is predominantly Roman Catholic. Presidents in 1951: Mamerto Urriolagoitia, until May 16; thereafter, Gen. Hugo Ballivián.

History.—Despite the fact that a presidential election was held in May, Bolivian politics continued during 1951 to be among the most unstable in the western hemisphere. On Feb. 16 outgoing President Urriolagoitia reorganized his cabinet in the hope that a new coalition administration would ensure order at least for the duration of the presidential campaign. Six candidates presented themselves for the presidency: chief among them were Gabriel Gonzálvez, 51, the administration's candidate, and former Finance Minister Víctor Paz Estenssoro, 43, leader of the opposition Nationalist Revolutionary Movement (M.N.R.), which had conducted a bloody despotism in 1943–46. Though a legal contestant for the presidency, Paz Estenssoro was forced to conduct his campaign from his Argentine exile. When he unsuccessfully attempted to return to Bolivia on April 14, widespread rioting occurred, during the course of which La Paz police, on April 15, killed 1 and arrested 81 demonstrators.

The presidential election, held on May 6, served only to heighten political and constitutional tension. According to the country's constitution, a presidential candidate must receive a majority of the popular ballots to be elected, and none of the six candidates polled the required number of votes. Paz Estenssoro, with 45% of the popular vote, received more votes than any other presidential aspirant. The constitution provides that, in the event that no candidate polls a majority of the ballots, congress should choose the new president from among the three candidates with the largest numbers of votes. However, outgoing President Urriolagoitia and his advisers were reluctant to comply with this stipulation for fear that it would deliver the government to Paz Estenssoro and the M.N.R.

Rather than risk a resumption of M.N.R. rule, Urriolagoitia resigned from the presidency on May 16, entrusting the administration to an army junta under the leadership of Gen. Hugo Ballivián. General Ballivián, a 49-year-old Chaco war hero, formed a ten-man military cabinet composed of three generals and seven colonels, and offered assurances that the presidency would be delivered "as soon as possible to him who, by the constitution, has the right to it." The Ballivián regime then proceeded to declare a state of siege, promise that a new presidential election would be held, and arrest a number of opposition leaders. Permission for a group of opposition exiles to return to Bolivia was granted by the Ballivián government on Aug. 24, and on Sept. 3 the administration frustrated a plot to overthrow it.

Irving Florman resigned in September as U.S. ambassador to Bolivia after having held that post for 22 months, and was awarded the Order of the Andean Condor, Bolivia's highest honour. (G. I. B.)

Education.—Bolivia in 1944 had 1,513 rural schools with 110,000 pupils and 1,740 elementary schools with 144,056 pupils. Secondary education was furnished by 55 colleges (27 public and 28 private) with 17,496 students. There were also several training colleges for teachers. There were universities with more than one faculty at Cochabamba, La Paz, Oruro, Potosi and Sucre. Education was scheduled to receive 16% of government expenditures in 1951. In 1951 there were 47 motion-picture theatres (not including those maintained by the tin mining companies) with estimated seating capacity of 32,300.

Finance.—The monetary unit is the boliviano, valued on Nov. 26, 1951, at $0.0165 U.S. currency, official rate; $0.0099, legal free rate; and $0.0048, curb rate. The 1951 budget provided for expenditure of 4,725,126,848 bolivianos and revenue of 3,058,827,765 bolivianos. Revenue estimates were based on a tin price of $1.20 per pound and production of 35,000 tons. Of the estimated expenditures, 19.6% was for national defense and 9.5% for government and immigration. The public debt on Dec. 31, 1949, amounted to 8,272,926,052 bolivianos, of which the foreign debt (including accrued interest) amounted to 5,829,296,000 bolivianos, the internal debt 2,304,799,208 bolivianos and the floating debt 138,830,784 bolivianos. Currency in circulation on Aug. 31, 1951, totalled 3,783,000,000 bolivianos; gold reserves of the Central bank $22,800,000; foreign exchange reserves $22,900,000; dollar exchange in U.S. banks $21,600,000. The cost-of-living index at La Paz stood at 1,040 in April 1951 (1937=100).

Trade and Communications.—Exports in 1950 were $99,000,000; imports were $41,900,000. Leading customers were the U.S. (52%) and the U.K. (41%); leading suppliers, the U.S. (47%), Argentina, Peru and the U.K. Tin accounted for about two-thirds of the exports by value, followed by silver and lead.

Railway lines in operation (1946) totalled 1,546 mi. Several lines were in various stages of construction in 1951, including two from Argentina and Brazil, respectively, to Santa Cruz in the eastern lowlands. The highway system (1949) comprised an estimated 15,420 mi., of which 4,008 mi. were improved. Motor vehicles in 1950 included 3,727 automobiles, 8,391 trucks and 467 buses. There were about 75,000 radio receiving sets in 1950.

Agriculture.—Important crops included maize, barley, wheat, rice and potatoes. In 1948 there were an estimated 3,499,000 cattle, 4,195,000 sheep, 1,910,000 goats and 1,465,000 pigs. The principal exploited forest products were rubber and cinchona bark.

Manufactures.—In 1948 there were 2,305 factories with 25,000 employees. The most important, in terms of value of production, were electricity, textiles and clothing, beverages, foodstuffs and glassware and ceramics.

Mineral Production.—Production in 1950 was reported as follows: tin 31,213 long tons; copper 5,185 short tons; lead 34,396 short tons; zinc 21,572 short tons; silver 6,566,766 fine ounces; antimony 9,679 short tons. Production of crude petroleum fell to about 620,000 bbl. (J. W. Mw.)

Book-Collecting and Book Sales.

The ready market for rare materials continued during 1951, thus following an earlier pattern. Materials of comparatively minor stature brought moderate prices in a slow market. Prices were supported by European collectors who seemingly invested in rare books as a hedge against inflation. There was a noticeable increase in this type of buying as South American, Cuban and Mexican buyers came into the market. An extraordinarily large number of seldom-offered rarities appeared and found ready buyers. Approximately one-third of all entries in *American Book-Prices Current, 1950–1951* were of this type of offering.

The importance of the European buyer was emphasized by Parke-Bernet Galleries, Inc. (New York, N.Y.), which for the first time in auction history exhibited in Paris, London and Geneva books to be sold at auction in New York. Buyers exercised much discriminatory caution and showed none of the fever of the 1920s. The best example was the first edition of Shelley's *Queen Mab* (London, 1813) annotated by the author, which brought $68,000 at the Kern sale (1929), but brought only $8,000 when sold in New York in 1951. The most important sale of the year was the auction in New York of the final portion of the Lucius Wilmerding library which brought $318,864. Among the items sold: Richard de Bury's *Philobiblon* (Cologne, 1473), $10,600; Rabelais's *La Vie . . . Gargantua* (Lyon, 1537), $6,300; the family diary of Michel de Montaigne bought by the French government for $21,000 for presentation to the city of Bordeaux.

The International League of Antiquarian Booksellers met at Brussels, Belg., in September with more than 200 delegates from 12 countries, the largest meeting in the league's history.

A small collection of Audubon paintings and books was discovered in the Sydney, Austr., home of Leonard Audubon, the naturalist's great-grandson. It was sold for the nominal price of $250 to E. G. K. Hallstrom, an Australian manufacturer, on condition that the collection be sent to the United States. It was presented to the National Audubon society, New York. In February the Scribner Book store (New York and London) announced rediscovery and purchase of the Shuckburgh copy of the Gutenberg Bible, two volumes, paper, which had been lost for a century.

Two rare book exhibitions were part of the Festival year in Great Britain: one, at Victoria and Albert museum, represented 500 years of English literature; collectors throughout the world loaned books for the purpose. On a less serious note Marylebone Borough council at Abbey house, Baker street, London, exhibited a collection of books and other memorabilia once "owned" by Sherlock Holmes. In Paris an exhibition of *Le Livre Anglais* attracted the bibliophile.

Under the terms of his will, Sinclair Lewis bequeathed to Yale university his "books, manuscripts, pictures and private papers of every sort." The Edwin J. Beinecke collection of Robert Louis Stevenson, about 5,000 pieces, was also presented to Yale. The E. DeGolyer collection of history of science and technology was deposited in the University of Oklahoma, Norman, as a partial gift. The American library (Paris) was given the extensive collection assembled by Sylvia Beach, Paris publisher of James Joyce's *Ulysses.* The J. Christian Bay collection of midwestern Americana was given to the State Historical Society of Missouri; and the Vilhjalmur Stefansson collection of Arctica, about 55,000 pieces, went to Dartmouth college, Hanover, N.H.

Published during the year were: *XIX Century Fiction: A Bibliographical Record* by Michael Sadleir; *The Tahitian Imprints of the London Missionary Society, 1810–1834* by George L. Harding and Bjarne Kroeplien; *Oklahoma Imprints, 1835–1890* by Lester Hargrett; *Recollections of James Lenox* by Henry Stevens, first published in 1886, now republished by the New York Public library with notes by Victor Hugo Paltsits; *Adventures of a Treasure Hunter* by Charles P. Everitt; *Dictionnaire de bibliographie haitienne* by Max Bissainthe; *Islands of Books* by Lawrence Clark Powell; and, of great significance, *Jahrbuch der Auktionspreise fuer Buecher und Autographen, 1950*, published in Hamburg, Ger., the first such record to be issued since 1940 and reporting the principal auctions in Germany, Austria, the Netherlands and Switzerland. (J. Bk.)

Book Publishing.

During 1951, the number of new books and new editions published in the United States continued to increase, and the total of 11,255 titles was near the record of 11,328 titles published in 1940. There were 233 more titles published in 1951 than in 1950, an increase of 2%. Of the total title production, imports represented 13%, about the same as the 1950 proportion. Fiction, which was 19% of the year's output, showed a net increase of 228 titles over the previous year. Other categories showing large net increases were philology, domestic economy and medicine and hygiene. Largest net decreases were in technical and military books, fine arts, music and general literature.

The five leading publishing houses of the year were Macmillan (506), Doubleday (with Garden City and Permabooks) (332), McGraw-Hill (with Gregg Publishing company and Whittlesey House) (288), Oxford (282) and Harper (with P. B. Hoeber) (262).

Newsstand titles of pocket books issued in 1951 totalled 972, compared with 940 titles in 1950; it was estimated that 231,300,000 copies were sold in 1951, compared with 214,000,000 copies sold in 1950.

"SALUTING THE FLAG in the Mott Street Industrial School, New York, About 1892," an illustration from Marshall B. Davidson's *Life in America*, a two-volume pictorial history of the United States published in 1951

Best Sellers.—Based on trade sales alone, the best-seller list for fiction in 1951 was headed by *From Here to Eternity,* by James Jones. A first novel dealing with army life before Pearl Harbor, it sold 240,000 copies. It was closely followed in sales by *The Caine Mutiny,* by Herman Wouk, a story of the navy in World War II. Third to tenth on the list, in that order, were *Moses,* by Sholem Asch; *The Cardinal,* by Henry Morton Robinson; *A Woman Called Fancy,* by Frank Yerby; *The Cruel Sea,* by Nicholas Monsarrat; *Melville Goodwin, USA,* by John P. Marquand; *Return to Paradise,* by James A. Michener; *The Foundling,* by Francis Cardinal Spellman; and *The Wanderer,* by Mika Waltari. Although two authors, Yerby and Waltari, were represented by other works on the 1950 list, *The Cardinal,* a novel with a religious theme, was the only carry-over.

First on the list of nonfictional best sellers for the year, based on trade sales alone, was *Look Younger, Live Longer,* by Gayelord Hauser. *Betty Crocker's Picture Cook Book* was second. These were followed, respectively, by *Washington Confidential,* by Jack Lait and Lee Mortimer; *Better Homes & Gardens Garden Book; Better Homes & Gardens Handyman's Book; Your Income Tax, 1952,* by J. K. Lasser; *The Sea around Us,* by Rachel L. Carson; *Thorndike-Barnhart Comprehensive Desk Dictionary,* Clarence L. Barnhart, editor; *Pogo,* a comic book for adult readers, by Walt Kelly; and *Kon-Tiki,* by Thor Heyerdahl, which remained on the list for 12 months.

On July 12, 1951, the Federal Trade commission issued a complaint against the book-club policies of a number of publishers. It was alleged that bookstores did not receive privileges available to the book clubs, giving the clubs an unfair competitive advantage which tended to create a monopoly. Hearings on the complaints began in Oct. 1951.

Great Books of the Western World.—Completed in 1951 for publication early in 1952 was an editorial project described as the most ambitious and the most significant of the 20th century. This was the publication of "Great Books of the Western World," incorporating the 443 works by 71 authors from Homer to Sigmund Freud which, the editors considered, best encompassed the learning of western man. This is a 54-volume set, of which 51 volumes are the Great Books themselves; the first volume is a statement, *The Great Conversation,* by Robert Maynard Hutchins, editor, describing the significance of the Great Books movement, and volumes 2 and 3 are a new educational tool and unique type of reference work, the *Syntopicon.* This word, a coined term, means "a collection of topics." Mortimer J. Adler, associate editor of the set, explained that it operated in the field of ideas as a dictionary operates in the field of words or an encyclopaedia in the field of facts. Its 3,000 topics give orderly access to related passages in the Great Books themselves. Encyclopædia Britannica, Inc., published *Great Books of the Western World* in collaboration with The University of

Chicago. (X.)

Great Britain.—During 1951 book publishers in Great Britain produced 18,066 titles, of which 4,938 were reprints and new editions. This total figure, the highest recorded, showed an increase of nearly 1,000 over the 1950 total of 17,072 titles. An increase in output of titles is not viewed by the book trade itself as a reassuring sign unless it is accompanied by a proportionate increase in the total sale of books, nor were publishers altogether reassured by the steadily mounting turnover figures, since progress here might reflect only the increased prices of books made necessary by rising costs.

The principal reasons for the publishers' concern was the shrinkage in their supplies of raw materials, especially of paper, and the rocketing costs of paper, printing and every item of overhead. By economizing in weight of paper, in size of type and in binding, publishers had until 1951 succeeded in holding the production costs of a straightforward book, for example a novel of ordinary length, at little more than double the 1939 figure. In this they had been assisted by the larger editions which an expanding market at home and overseas made possible and consequently the retail prices of books had risen far less than was justified by costs, many books being still only one and a half times their pre-World War II prices. In 1951, however, it became clear that publishers could no longer continue to absorb the large further increases in costs. Moreover, the cost of paper soared by progressive leaps to the point where the advantage of "the long run," which in modern times had always been the book publisher's basic source of profit, was considerably reduced.

To this generally difficult situation, however, there were two ameliorating factors. One was that books, though dearer, had increased in price proportionately less than any other commodity. The other was that the book-buying public bought the books it favoured in quite unprecedented numbers. The amount of trade done by publishers in 1950 had reached the unprecedented figure of £37,158,652 (the pre-World War II average annual total was approximately £10,000,000). During the first six months of 1951 publishers' total sales amounted to more than £18,000,000, an increase by nearly £1,500,000 on the turnover of the corresponding period of 1950. An analysis of publishers' output made by the *Bookseller* showed the average price of books published during the first six months of 1951 to be 12*s.* 9*d.* In the preceding six months, July-Dec. 1950, the average price was 12*s.*3*d.* These statistical averages were based on titles only; many of the books most in demand cost much less than 12*s.* 9*d.* each. (*See* also AMERICAN LITERATURE; ENGLISH LITERATURE; etc.) (E. SE.)

Boston, The capital of Massachusetts and the tenth largest city in the United States, with a land area of 43.9 sq.mi., had a population of 801,444 by the 1950 federal census, an increase of 30,628 or 4% over 1940.

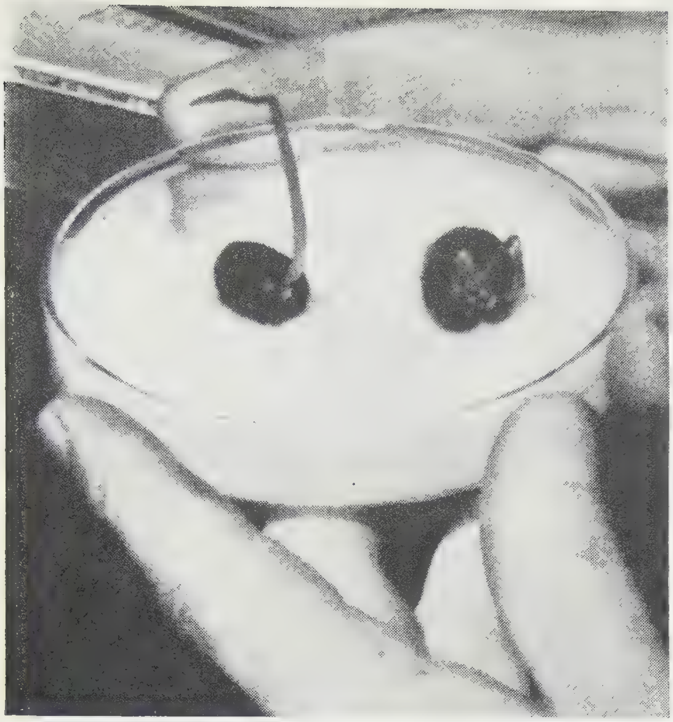
For the first time in the history of the city, a preliminary election was held in 1951 for mayor, city council and school committee. The ballot in this election contained the names of 4 candidates for mayor, 65 for city councillor and 36 for school committee. Mayor John B. Hynes and former Mayor James M. Curley were nominated for mayor, with Hynes running 31,146 votes ahead of his predecessor. On election day Mayor Hynes received 154,201 votes, or 77,851 in excess of his opponent. Sometime prior to the preliminary election, a group of citizens representing all sections of the city organized under the name New Boston committee. Following a survey of the records and views of the candidates for council and school committee, this group endorsed nine candidates for city council and five for school committee. In the final election five of the New Boston committee slate for council were elected and four were elected to the school committee.

The 1951 tax rate was $62.80, a reduction of 20 cents from the previous year, and was based on an assessed valuation (real and personal) of $1,570,760,000, representing an increase of $3,260,000 from the previous year. Budgets of city and county departments totalled $88,758,724.95, an increase of $2,204,480.45 over 1950, whereas the school budget of $26,300,658.37 represented a decrease of $250,327.77 from the year before. The net debt of the city was reduced by $3,000,000, making a total reduction of $4,000,000 in the last two years. (C. J. FX.)

Botany. Among the interesting and important contributions in botanical research during 1951, a great number appeared in the field of plant physiology. An outstanding event was the production of artificial photosynthesis by the combination of extracted biochemical systems. Wolf Vishniac and Severo Ochoa and Daniel I. Arnon obtained fixation of carbon dioxide into organic compounds by coupling the well-known Hill reaction to the "malic" enzyme system through the intermediary of pyridine nucleotides. With this system energy derived from light forces a combination of carbon dioxide and pyruvic acid with the production of malic acid.

Studies on growth-regulating substances occupied the attention of a number of botanists. C. D. Darlington and John McLeish investigated the action of maleic hydrazide on the cell and found that it caused the breakage of chromosomes at mitosis. Unlike X-rays, which only break the euchromatin, maleic hydrazide restricts breaking to the heterochromatin. It also differs from other chromosome-breaking agents in not providing a sticky surface. The authors inserted a word of caution to the effect that this substance should not be too widely used in agriculture until further tests were made because other known chromosome-breaking agents are also carcinogenic. Several other studies on maleic hydrazide were published. E. R. Marshall and O. Smith reported that maleic hydrazide injected directly into potato tuber tissue was a very effective sprout inhibitor. F. M. R. Isenberg and colleagues found that maleic hydrazide sprayed upon onion leaves affected respiration through the partial inactivation or inhibition of dehydrogenases. Much work was also done on paper chromatography, including new techniques and uses and consideration of its early history.

A number of contributions appeared in cytogenetics and related fields. Andre Gillis and L. F. Randolph found that there was a reduction in quadrivalent frequency in autotetraploid maize after ten years, apparently as a result of selection. Their results were significant in suggesting that chromosome pairing may not always be a reliable guide as to whether a plant is an autotetraploid or an allotetraploid. The evidence for the existence of duplicate genes in maize rested on firm footing according to the recent discussion of M. M. Rhoades, but whether such genes reflect an amphidiploid origin of maize could not yet be answered. Contrary to the claims of soviet investigators, L. Sachs showed that intervarietal grafting in the tomato produced no observable influence on leaf shape or fruit colour. R. E. Cleland found races of *Oenothera* with extra, diminutive chromosomes which behave normally at meiosis and have no noticeable phenotypic effects. It appeared that the extra chromosomes arose through fragmentation or as the result of hybridization. Harlan Lewis found supernumerary chromosomes in *Clarkia* which also have no phenotypic effect but which may



SPROUTING LOTUS SEEDS shown by radiocarbon tests to be about 1,000 years old. They were found by archaeologists in Manchuria and successfully germinated by a U.S. plant pathologist in 1951

have been of importance in the establishment of entities with new chromosome numbers. Many taxonomists again turned their attention to natural hybridization, with studies appearing on *Cirsium, Helianthus* and *Liatris.* The recent work in the field of natural hybridization was reviewed by H. G. Baker in *Biological Reviews.*

An important contribution to mycology was the report of the isolation and culture of the rust *Gymnosporangium juniperivirgianae* upon artificial media by H. H. Hotson and V. M. Cutter, Jr. The rusts had long been regarded as strict obligate parasites incapable of culture upon artificial media.

Also of interest was the publication of another report on W. J. Beal's buried seed experiment. In 1879 Beal began an experiment to determine the seed viability of a number of species by placing the seeds in bottles in the soil and digging up the seeds at intervals for determination of the germination capacities. In the 70-year report on these tests, H. T. Darlington found the seeds of three species, *Oenothera biennis, Rumex crispus* and *Verbascum blattaria,* were still viable.

During the year R. N. Colwell announced a new use of radioisotopes for the determination of spore distribution patterns by tagging spores with radioactive phosphorus. He suggested that detailed information as to the distributions of fungus spores, pollen grains of weeds and agricultural dusts and sprays could be secured by such methods. Another series of radiocarbon dates was published by W. F. Libby. Charcoal from Bat cave, N.M., where prehistoric maize had been found was dated as from 5,000 to 7,500 years old. Lotus seeds (from the Manchurian deposit which had produced viable seed) previously suspected to be 50,000 years old proved to be around 1,000 years old. The fibrillar construction of the cilia of a fern spermatozoid was demonstrated by I. Manton and B. Clarke through electron microscope studies.

Among the new uses suggested for plants were two of importance to medicine. B. B. Hiram *et al.* suggested the use of okra as a plasma replacement. The purified aqueous mucilaginous extracts from okra were found to be nontoxic when used as intravenous fluids for laboratory animals and were found to restore circulatory volume and improve cardiac output in dogs. The search for steroids with which to produce cortisone continued with an announcement from Merck and company that extracts from yeast, soybeans and the Mexican yam appeared promising.

A symposium on the origin and distribution of cultivated plants of south Asia was held in Delhi under the auspices of the Indian Society of Genetics and Plant Breeding, with S. C. Harland, Edgar Anderson and A. Müntzing in attendance. The National Research council of the United States in association with a number of botanists established a seed bank of native maize varieties in order to provide a reservoir of genes for the plant breeder. (*See* also Agricultural Research Administration; Genetics; Palaeontology.)

Stover, *An Introduction to the Anatomy of Seed Plants* (1951). (C. B. Hr.)

Arboretums and Botanical Gardens.—Probably the most important incident that happened during the year 1951 as far as the arboretums and botanical gardens of the United States were concerned was the founding of the Saratoga Experimental gardens at Saratoga, Calif. The establishment of such an institution had been a life-long ambition of Ray D. Hartman, one of the leading horticulturists on the Pacific coast and owner of one of the oldest nurseries in western North America, the Leonard Coates nurseries of San Jose, Calif., who initiated the work resulting in this new arboretum.

The site chosen has an elevation of 450 ft. at the base of the Santa Cruz mountains. Maunsell Van Rensselaer, formerly director of the Santa Barbara Botanic garden for 16 years, was chosen as the director, and the garden was officially opened Jan. 1, 1951.

For the next few years, emphasis would be placed on the selection and propagation of the best available strains of shade trees and native shrubs. Experimental studies would be carried on in methods and techniques of propagation of superior plant stock on a large scale. Work in plant breeding was contemplated for the future. The gardens were to be operated on a nonprofit basis and were expected ultimately to be self-sustaining. (*See* also Horticulture.) (D. Wn.)

In Great Britain, after the great influx of seeds from the Himalaya in recent years, 1951 was a year of consolidation in most botanical gardens and many of the collected plants flowered for the first time, particularly those in the genus *Primula.*

J. Macqueen Cowan and H. Davidian of the Edinburgh Botanic garden completed their revision of the large Thomsonii series of the genus *Rhododendron* and this was published in the *Rhododendron Year Book* of the Royal Horticultural society.

At the Royal Horticultural society's gardens at Wisley, Surrey, H. R. Fletcher took up his appointment as director. Fletcher was formerly at the Edinburgh Botanic garden. Many notable plants flowered in the gardens during the year and a number of these were shown in a large group of plants for a woodland garden staged from the gardens at the Chelsea Flower show. The overhaul of the rock garden at Wisley was continued and this part was a notable feature of the garden in 1951. On the scientific side, work continued on the selection and crossing of antirrhinum stocks resistant to rust. In the cytology department, examinations of the genera *Camellia, Viburnum, Lonicera, Narcissus, Nerine* and *Buddleia* were made. The first colchicine-induced tetraploid in rhododendron was also produced at Wisley in *Rhododendron wardii.*

Bowles, Chester (1901–), U.S. ambassador to India, was born on April 5 in Springfield, Mass. He attended Choate school and Yale university, graduating in 1924, worked for a year on the *Springfield Republican* and four years in a New York advertising firm. In June 1929, in partnership with William Benton (*q.v.*), he started the advertising firm of Benton and Bowles, Inc., and in 1936 he became chairman of its board of directors.

In June 1942 he was appointed district director of the Office of Price Administration for the state of Connecticut. In July 1943 he became general manager of the OPA in Washington, D.C., and three months later Pres. Franklin D. Roosevelt named him national OPA administrator. In Feb. 1946 Pres. Harry S. Truman made him director of economic stabilization with responsibility for all anti-inflation wage, price and production controls. He resigned from this position in June 1946 and in the fall of that year was an unsuccessful candidate for the Democratic nomination for governor of Connecticut.

In Nov. 1946 Bowles was appointed a U.S. delegate to the first conference of U.N.E.S.C.O. in Paris and in the early spring of 1947 he became international chairman of the United Nations Appeal for Children.

He was elected governor of Connecticut in Nov. 1948. In the two years of his administration he introduced legislation providing for expansion of public education, housing, welfare and child care programs, labour legislation and reorganization of the state government. He was defeated for re-election in 1950 by a narrow margin. On Sept. 12, 1951, Bowles was appointed ambassador to India and Nepal.

He was the author of *Tomorrow Without Fear* and many articles in national publications on economic, domestic and foreign affairs. (R. R. R. B.)

Bowling. Lee Jouglard of Detroit, Mich., with an all-time record of 775 rolled on May 7, 1951, won singles honours in the American Bowling congress championships at St. Paul, Minn. The new titleholder put together games of 242, 255 and 278 to annex the prize in the 58-day competition. Tony Lindeman of Detroit, with 2,005, took the all-events crown, while two other Michigan keglers, Bob Benson and Eddie Marshall of Lansing, carried home the doubles prize with a score of 1,334. The five-man team crown was captured by the C. B. O'Malley quintet of Chicago with a total of 3,070.

Jouglard, named "Bowler of the Year," gained additional glory in the first masters' invitation competition of the A.B.C. held in conjunction with the annual title tourney. The Detroit star clinched the top prize by defeating Joe Wilman of Berwyn, Ill., 662 to 612 in the championship match on June 2.

Ida Simpson of Buffalo, N.Y., took singles laurels in the Women's International Bowling congress tournament at Seattle, Wash., May 17–June 24, with LaVerne Haverley of Los Angeles, Calif., winning the all-events. Esther Cook and Alma Donini of Seattle triumphed in the doubles, and the Hickman Oldsmobile Whirlaways of Indianapolis, Ind., took team honours.

Mrs. Marion Ladewig of Grand Rapids, Mich., the woman "Bowler of the Year," won the women's title for the third straight season in the world match-play championships at Chicago in December. She tallied 159.17 under the Petersen scoring system. Junie McMahon of Chicago led the men with 309.29. Connie Powers of Detroit bettered the tourney mark for both men and women when she rolled games of 234, 247, 247 and 259 for a total of 987.

Bowls: *see* LAWN BOWLING.

Boxing. The highlight of the year 1951 in boxing revolved about Sugar Ray Robinson and his world middleweight title. He lost his 160-lb. championship to Randy Turpin, Great Britain's champion, in a 15-round bout in London, July 10, in the most amazing boxing upset in recent years. Turpin startled the sports world when he won an unquestioned decision over Robinson in the London bout.

However, a condition of the London match was that Turpin had to make his first defense of the championship against Robinson. This return was staged at the Polo Grounds, New York city, on Sept. 12 and, before the year's largest crowd and for the year's largest gate receipts, Robinson regained his title by a technical knockout over Turpin in the tenth round of a scheduled 15-round bout. The knockout came with electrifying suddenness. Robinson was having difficulty with Turpin until, in the tenth round, a collision of heads reopened an old cut over Robinson's left eye. Robinson immediately cast aside the caution he had previously exercised and battered his foe into a helpless state.

A crowd of 61,370 viewed the match. The box-office receipts amounted to $767,626. It was estimated that income from motion pictures of the bout exceeded $200,000. Income from theatre television, a development whereby telecasts are blacked out for local home consumption but are shown on screens in theatres engaged for the purpose, where admissions are charged exclusively for the fight telecast, amounted to $25,000. Robinson's 30% of all net receipts amounted to $188,491. Turpin, fighting for 25%, collected $157,075.

The bout was neither telecast nor broadcast over the radio for home consumption. The staggering amount of the receipts, therefore, was accepted as support for the contention that television definitely had made inroads on boxing receipts and on boxing development. From the economic standpoint, the situation was a contradiction. Box-office receipts unquestionably had decreased, as such. However, the income from television and radio had attained great proportions. The best available information was that the International Boxing Club, Inc., which has a virtual monopoly on all important ring bouts in the United States, collected $800,000 from this source. The discouraging influence was found in another direction. Smaller boxing clubs suffered because of the popularity of television as a medium, particularly when the coaxial cable was extended coast to coast. The consequence was that the supply of promising boxers was depleted for want of elementary proving grounds. Attendances dropped to as low as 300 and 400 in some centres. Even in Madison Square Garden, on Sept. 14, only 1,452 onlookers viewed a bout between Eugene Hairston and Jackie Keough, middleweights.

Rivalling the Robinson-Turpin events from the standpoint of surprise element was the seven-round knockout Jersey Joe Walcott scored over Ezzard Charles at Pittsburgh, Pa., July 18, to win the world heavyweight title. This was one of the year's biggest upsets.

Robinson had surrendered his world welterweight title when he knocked out Jake La Motta in 13 rounds at Chicago in February, to win the world middleweight title. This abdication produced an elimination series which ended with Kid Gavilan, Cuba, being recognized in the United States as world welterweight champion. His claim was disputed by European boxing authorities, who recognized Charles Humez, French boxer, as world champion. Johnny Bratton, Chicago, beat Charley Fusari, New Jersey, for Robinson's discarded welterweight title, in a bout waged in Chicago, March 14, and recognized as a championship bout by the National Boxing association. Gavilan beat Bratton in New York city, May 18, to become world welterweight champion, at least in the United States.

SUGAR RAY ROBINSON (arms upraised) shown in ring after he regained the world middleweight title from Randy Turpin of England at the Polo Grounds, N.Y., Sept. 12, 1951. Earlier, in London, Turpin had defeated Robinson in the biggest ring upset of the year

James Carter, New York city, knocked out Ike Williams, Philadelphia, in 14 rounds of a bout in New York, May 25, to become world lightweight champion.

The eclipse of Joe Louis came in October. The 37-year-old former champion, fighting a comeback campaign for another chance at the title he once held, was knocked out in eight spectacular rounds by Rocky Marciano, young Brockton, Mass., heavyweight.

Joey Maxim, Cleveland, O., world light-heavyweight champion, Sandy Saddler, New York, world featherweight champion, Vic Toweel, South Africa, world bantamweight champion, and Dado Marino, Honolulu, T.H., world flyweight champion, all retained their titles. Saddler stopped Willie Pep, former champion, in 9 rounds of a scheduled 15-round bout in New York, to keep his title. However, the bout was marked by such rough, unethical boxing on the part of both that Pep's boxer's licence was revoked and Saddler was suspended following the match. This disciplinary action was taken by Robert K. Christenberry, who became chairman of the New York State Athletic commission following the resignation of Col. Edward P. F. Eagan. The latter's resignation followed the death of Georgie Flores, Brooklyn boxer, after a bout in New York. Christenberry was appointed by Gov. Thomas E. Dewey, with a mandate to "clean up" boxing in New York.

The death of Flores in a New York ring touched off an official probe in that state. Extensive investigations were being conducted by the state's athletic commission as the year ended. Particular interest was being manifested in contracts the International Boxing Club, Inc., held on six ring champions covering "exclusive service." These documents were being investigated on the basis of their possible relation to monopoly in restraint of trade. The department of justice in Washington, D.C., in October launched an independent investigation of the I.B.C. to determine whether the organization was operating in violation of the Sherman antitrust law. With respect to all these investigations the I.B.C., through its president, James D. Norris, Jr., of Chicago, co-operated fully. (J. P. D.)

Great Britain.—During the year the British Boxing Board of Control refused to sanction the introduction of the American "no foul" rule.

The British heavyweight champion, Jack Gardner, won the European championship by outpointing Joe Weidin, Austria, in March, but subsequently lost this title to Hein Ten Hoff, Germany. Two other heavyweights whose progress was watched with interest were Johnny Williams, Rugby, and Ray Wilding, Cheshire.

Don Cockell, London, who shared with Randy Turpin the distinction of being the most improved boxer of 1951, won the European light-heavyweight title by beating Albert Yvel, France, and later successfully defended his British crown by beating Albert Finch, but was beaten by Jimmy Slade (U.S.) in December. In the welterweight division, Eddie Thomas, Wales, won the empire title from Pat Patrick in Johannesburg, U. of S.Af., and then, in the European championship, after beating Michele Palermo, Italy, was defeated by Charles Humez, France. Finally, he forfeited his British title to Wally Thom, Liverpool.

The British lightweight title changed hands when Billy Thompson, the holder, was beaten in the first round by Tommy McGovan. Ronnie Clayton, Blackpool, successfully defended his native flyweight title against the veteran Al Phillips, Aldgate, but lost his empire title to Roy Ankarah, the Negro boxer from the Gold Coast, who made up for lack of style by nonstop aggression and was apparently indifferent to punishment. Peter Keenan, Glasgow, won the bantamweight title when he defeated Danny O'Sullivan and later he added further to his reputation by outpointing the Spaniard Luis Romero to win the European title. The vacant British flyweight title was won by Terry Allen, London, when he outpointed the Scot Vic Herman. (W. B. Dy.)

Boy Scouts: *see* Societies and Associations, U.S.

Bradley, Omar Nelson

(1893–), U.S. army officer, was born on Feb. 12 in Clark, Mo., was graduated from the U.S. Military academy at West Point, N.Y., in 1915 and became a major of infantry in World War I. He was graduated from the Infantry school, Ft. Benning, Ga., in 1925, the Command and General Staff school, Ft. Leavenworth, Kan., in 1929 and the Army War college, Washington, D.C., in 1934. He taught at West Point until 1938, and then had duty on the army general staff in Washington, D.C. During World War II he commanded the 2nd corps in Africa and Sicily, and subsequently all U.S. ground troops for the invasion of Europe. As commander of the 12th army group he supervised more than 1,300,000 combat troops, the largest body of U.S. soldiers ever to serve under a single field commander. By the end of the war he was a full general. From Aug. 15, 1945, to Dec. 1, 1947, he was administrator of veterans' affairs. On Feb. 7, 1948, he succeeded General of the Army Dwight D. Eisenhower as army chief of staff, and on Aug. 16, 1949, became the first permanent chairman of the U.S. joint chiefs of staff.

During 1951 General Bradley opposed the far eastern military policies of General of the Army Douglas MacArthur, charging in testimony before a joint session of the U.S. senate armed services and foreign relations committees that those policies would involve the U.S. in "the wrong war, at the wrong place, at the wrong time and with the wrong enemy." He advocated a counter policy of attrition against the Communist forces in Korea. Regarding military plans in Europe, he expressed the view that the Atlantic bloc would be "better off" with Spain, Greece and Turkey in the alliance. His autobiography, *A Soldier's Story,* appeared in 1951. On July 25 he was reappointed to a second two-year term as chairman of the U.S. joint chiefs of staff, the appointment to become effective Aug. 15.

Brannan, Charles Franklin

(1903–), U.S. secretary of agriculture, was born on Aug. 23 in Denver, Colo., and was graduated from the University of Denver law school in 1929. He practised law in Denver until 1935, when he became assistant regional attorney of the Resettlement administration, and later regional attorney in the solicitor's office of the U.S. department of agriculture. From Nov. 1941 to April 1944 he was regional director of the Farm Security administration for Colorado, Wyoming and Montana. He was named assistant secretary of agriculture in June 1944 and secretary of agriculture in June 1948.

Secretary Brannan was the author of a plan designed to maintain farm incomes and still give the consumer the benefit of prices that would "seek their level," by supporting farm incomes with government subsidies to make up any difference between current market prices and farm incomes scaled to the 1939–48 level. Considerable controversy developed over the plan, which had the support of Pres. Harry S. Truman, but agitation for it died down when the U.S. rearmament program sent farm prices upward again in 1950 and 1951.

Brazil.

A federal republic in eastern and central South America, Brazil is the second largest nation in the western hemisphere. Language: Portuguese; religion: predominantly Roman Catholic with about 1,200,000 Protestants of various denominations. Chief cities: Rio de Janeiro, the capital (1951 est. pop., 2,500,000); São Paulo (2,300,000); Recife (550,000); Salvador (450,000); Pôrto Alegre (425,000); Belo Horizonte (370,000); Fortaleza (290,000); Belém (270,000).

President (from Jan. 31, 1951): Getulio Vargas.

Brazil's area of 3,286,170 sq.mi. is second only to that of Canada in the western hemisphere. The population, according to the census of 1950, was 52,645,479, three-fourths of which was concentrated along a narrow coastal strip.

Area and Population of States and Territories of Brazil

(Estimates published by the Instituto Brasileiro de Geografia e Estatística)

State or territory	Area (sq. mi.)	Pop. (Jan. 1, 1950)	Capital
North			
Acre (terr.)	57,153	116,124	Rio Branco

*Area in dispute between the states of Minas Gerais and Espírito Santo.

History.—Getulio Vargas, the candidate of the Brazilian Labour party (P.T.B.) backed by a large majority (3,849,040 votes out of a total of 7,898,083 distributed among various candidates), was declared elected by the superior electoral tribunal and inaugurated as president on Jan. 31, 1951. He at once set himself to adopt measures calculated to control inflation and to provide a more adequate supply of essential foodstuffs. The suspicion of some that Vargas would return the country to a dictatorship seemed groundless. Likewise, Communist hopes that the president would refuse to co-operate with the United States were soon dispelled. In fact, in harmony with an agreement signed between the two countries on Dec. 19, 1950, a United States-Brazil joint commission for economic development (under the U.S. Point Four program) was installed in July at Rio de Janeiro. The purpose of the joint commission was to study the economic needs of Brazil and to make recommendations for development and improvement in specific fields, particularly transportation, electric power, food and agriculture and minerals. By the end of the year the first project prepared by the joint commission had formally been presented to the Brazilian government. The importance which the Brazilian administration attached to this program was shown in the legislative measures submitted to the national congress to finance the development projects recommended. An amendment to the new income tax law provided for a 15% surtax, designed to raise Cr$ 10,000,000,000 to finance the program. A second bill called for the establishment of a bank for re-equipment and economic development to handle all funds for the administration of the development projects adopted.

In September the Brazilian minister of finance, Horacio Lafer, visited the United States for consultation with officials of the U.S. government, the Export-Import Bank of Washington and the International Bank for Reconstruction and Development in connection with the new development plans.

INAUGURAL SHOWER of rose petals for Getulio Vargas (seated right), who took office as president of Brazil on Jan. 31, 1951

To assist Brazil in the development of a modern atomic energy research project, the United States government sent to Brazil several outstanding U.S. scientists, including Gordon Dean, chairman of the U.S. Atomic Energy commission. Adm. Alvaro Alberto, president of the Brazilian National Research council, visited the United States and Canada (in September) in connection with Brazilian atomic research projects.

Despite vociferous Communist propaganda against furnishing any military assistance to the U.N. forces in Korea, the Brazilian government sent Gen. Pedro Aurelio de Goes Monteiro, chief of staff of the Brazilian armed forces, to the United States in July to consult with U.N. leaders and U.S. authorities on possible means of co-operation of Brazil with the U.N.

At the invitation of the Brazilian government, the first congress of the Latin union met at Petropolis (Oct. 15–21), with delegates from 26 countries. The purposes of the congress were declared to be to assure support for the principles on which Latin civilization and ways of life and thinking rest; and to encourage spiritual ties and intellectual interchange between the Latin countries. The congress adopted a charter of principles; selected Madrid, Sp., as seat of the second congress (1953); and decided to postpone the adoption of statutes for the Latin union until the Madrid meeting. The question of whether representation would be by government appointment or by delegates from unofficial national committees prevented adoption of the statutes at Petropolis.

Internally, a revolutionary movement broke out in the interior and capital of the northern state of Maranhão (in September), a result of opposition to the inauguration of state Gov. Eugenio de Barros, declared elected by the regional electoral tribunal. Peace was restored by federal forces only after some fighting between partisans of Governor de Barros and his political enemies resulted in a number of casualties and considerable damage to property. (R. d'E.)

Education.—In 1950 there were 60,000 primary schools with 4,500,000 pupils, about 1,500 secondary schools with 300,000 students and about 2,700 vocational, commercial and professional schools with 200,000 students. There were ten universities, of which three were private (Catholic), six state and one federal (University of Brazil at Rio de Janeiro). In 1951 the 1,736 motion-picture theatres had seating capacity of 1,071,560.

Finance.—The monetary unit is the cruzeiro (Cr$), valued at $0.0534 U.S. currency, official rate, during 1951 and at $0.0342, curb rate, on Nov. 30, 1951. Actual government expenditure in 1950 was Cr$ 23,670,000,000; revenue, Cr$ 19,373,000,000. The 1951 budget estimated expenditure at Cr$ 22,800,000,000 and revenue at Cr$ 20,500,000,000; the new government eliminated the deficit by reducing allocations to the SALTE plan and other appropriations. The 1952 budget as approved by congress called for expenditure of Cr$ 25,431,000,000 and revenue of Cr$ 25,537,000,000. On Dec. 31, 1950, the internal floating debt was reported as Cr$ 14,849,110,182; internal funded debt Cr$ 10,439,287,620; external debt £37,700,265 and $110,268,695. Currency in circulation (July 31, 1951) amounted to Cr$ 26,920,000,000; demand deposits (Dec. 31, 1950) Cr$ 44,820,000,000; gold reserves (Oct. 31, 1951) $317,000,000; foreign exchange reserves (Dec. 31, 1950) $724,000,000; dollar exchange in U.S. banks (Sept. 30, 1951) $140,000,000. The cost-of-living index (São Paulo) stood at 481 in July 1951 (1939=100).

Trade.—Exports in 1950 totalled Cr$ 24,910,000,000; imports, Cr$ 20,310,000,000. In the first six months of 1951 exports were Cr$ 15,299,418,000 and imports Cr$ 15,920,906,000. Leading exports in 1950 were coffee (64%), raw cotton (8%), cacao (6%) and pine (2%); leading imports, machinery and vehicles (42%), petroleum and products (12%), wheat and flour (10%) and iron and steel and manufactures (5%). The leading customers were the U.S. (55%), the United Kingdom (8%), Argentina (6%), France (5%) and Belgium (3%); leading suppliers, the U.S. (34%), the United Kingdom (12%), Argentina (10%), Belgium (6%) and France (5%).

Communications.—Railway mileage (1951) was about 23,000; highways, 38,000; common roads, 124,000. On Jan. 1, 1951, there were 238,478 automobiles, 192,023 trucks and 14,220 buses. In 1950 the 21 Brazilian air lines flew 42,500,000 mi. and carried 1,616,420 passengers. According to *Lloyd's Register of Shipping*, the merchant marine had 328 vessels (100 tons and over) aggregating 698,160 gross tons on June 30, 1950. There were three television stations in operation at the end of 1951.

Agriculture.—Coffee production in the 1950–51 season totalled 16,948,000 bags of 132 lb. each. In 1950, 14,834,885 bags were exported, of which 9,746,391 bags went to the U.S., 704,801 bags to France and 587,576 bags to Sweden. Cacao production in 1950–51 was 150,000 short tons; exports in 1950 were 135,250 short tons. Estimated production of other crops in 1950–51 included rice (paddy) 3,300,000 short tons; cotton (ginned) 357,500 tons; sisal 55,000 tons; wheat 570,000 tons; tobacco 118,250 tons; and potatoes 825,000 tons. Refined sugar production in 1950 was 1,541,750 tons. In 1950 about 158,000,000 bunches of bananas and 35,674,000 boxes of citrus fruit were produced.

Livestock (Dec. 31, 1948) included 50,089,000 cattle, 13,804,000 sheep and 23,881,000 pigs. About 5,900,000 head of beef cattle were slaughtered in 1950. Wool production was 20,550 short tons. Rubber production (1950) was 23,922 long tons; carnauba wax exports, 14,063 short tons. In 1950, 16,600 short tons of barbassu kernels and 11,950 tons of barbassu oil were exported.

Manufactures.—Production in 1950 included cement 1,523,352 short tons; pig iron 803,633 tons; steel 859,205 tons; and newsprint 41,731 tons.

Mineral Production.—Production in 1950 included coal 2,185,930 short tons; gold 131,204 troy ounces; and (1949) iron ore 1,931,196 tons. (*See* also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.) (J. W. Mw.)

Bread and Bakery Products.

The necessity for more experimental studies of bread and other bakery products became increasingly evident to leaders in the baking industry during World War II, and led to the establishment in a number of countries of modern, well-equipped laboratories. In 1950 the new laboratories of the American Institute of Baking, supported financially by the baking and allied industries of the United States, were opened in Chicago. Two of the projects on which these laboratories were engaged in 1951 were the nature and measurement of staling, and the general nutritive value of bread.

Staleness of bread, it was shown, could best be measured by a laborious process of taste testing with a panel of selected persons. Correlation of this subjective measurement with some of the objective measurements used in the laboratory, such as measures of the firmness and crumbliness of the bread, showed that not all the laboratory methods commonly employed were suitable. An interesting observation reported during 1951 was that canned cake, as contrasted with bread, remains fresh and apparently unchanged for many months, probably because of its low moisture content and a difference in the nature of the starch complexes that are formed in the baking process.

Silvio Crespo and W. B. Bradley reported that commercial bread in the United States contains on the average 404 mg. of calcium in each pound, which means that bread is a nutritionally significant source of this dietary essential. More than one-third of this calcium, or 138 mg., is contributed by skimmed milk solids. The remainder is contributed by the other ingredients, of which the richest sources of calcium are the so-called yeast foods, and some of the mould inhibitors and acidifying salts frequently employed in commercial bread baking.

J. L. Kadavy and G. M. Dack reported that canned bread, made according to U.S. army specifications, is not sterile, but does not permit the growth of bacteria if precautions are exercised in its formulation and processing.

Partially baked rolls, which were perfected in the laboratories of General Mills, Inc., Minneapolis, Minn., became firmly entrenched as consumer items during the year. In these rolls, the baking process is stopped before the crust becomes fully coloured. The consumer stores these rolls until needed and then completes the baking process in the home, thus securing a freshly baked product with a minimum of effort and no baking disappointments. A report by H. W. Loy, Jr., J. F. Haggerty and E. L. Combs indicated that partially baked products should be stored protected from light, in order to avoid the possibility of the loss of riboflavin, an important ingredient of enriched rolls.

The baking industry in the United States observed during 1951 the tenth anniversary of its adoption of the enrichment program, whereby enriched bread is required to meet certain standards of content of thiamin, riboflavin, niacin and iron. As of 1951 there were 26 states which required that all white bread and rolls, as well as family flour, must be enriched. In other states, most of the bread was also enriched.

The U.S. department of commerce issued a report of its census of small businesses, which showed that there were about 20,000 retail bakeshops in the United States. The value of bakery products commercially produced in the United States in 1951 was estimated to be approximately $3,400,000,000. This estimate did not include the value of the products produced by the biscuit, cracker and pretzel segment of the industry. If these were included, the total production in dollar value of products sold would be about $4,000,000,000. (*See* also FLOUR.)

Brewing and Beer.

Beer and ale sales in the United States for the fiscal year ending June 30, 1951, totalled 83,246,162 bbl. (of 31 U.S. gallons each), the fourth highest fiscal year on record. The largest sales for a fiscal year were 86,992,795 bbl. in 1948.

Wisconsin was again the leading state, both in production, at 13,647,430 bbl., and taxpaid withdrawals, 12,413,031 bbl. New York was second in both categories and Pennsylvania third.

A National Production authority order reducing usage of cans by brewers was believed to have had a restrictive effect on sales. By the third and fourth quarters of the calendar year 1951, brewers' quotas of cans had been set at 70% of their usage for the corresponding 1950 periods. The same quota was to maintain until Oct. 1, 1952. The effect was felt by many brewers, since 72.7% of all fiscal 1951 withdrawals were in bottles or cans. In the calendar year 1950, beer in cans represented 25% of all packaged sales.

An increase of $1 per barrel in the federal excise tax on beer, bringing the new rate to $9 per barrel, became effective Nov. 1, 1951. In addition, state taxes averaged more than $2 per barrel, and in some cases, local taxes were also applied.

An industry-wide safety contest, sponsored by the United States Brewers foundation and launched during the last half of 1950 to encourage efforts to keep brewing plants accident-free, was repeated in 1951 with satisfactory results. Ten breweries completed the 1950 competition with perfect records of no accidents. The industry as a whole lowered its accident frequency during 1950 by 42% as compared with 1948.

Another highlight was the citation by the military authorities of the United States Brewers foundation's Armed Forces Liaison program, which was aimed at maintaining wholesome conditions surrounding the retail sale of beer at establishments frequented by military personnel.

Beer, as a nonintoxicating beverage, was sold at nearly all post exchanges. Army beer purchases for the men overseas for the first nine months of 1951 amounted to $10,958,354. Beer was purchased out of nonappropriated funds for sale through servicemen's and officers' clubs and post exchanges. Starting Oct. 25, 1950, beer was shipped free to overseas commands by the military sea transport service of the department of defense. Prior to that, army exchange service paid normal freight charges.

Moderation and Enforcement.—Close co-operation among brewers, wholesalers and retailers continued to be an integral part of the industry's self-regulation program which had its inception in 1938. This program, sponsored by the foundation, whose members produce more than 87% of the beer and ale in the U.S., is designed to impress upon industry members, particularly retail licensees, the importance of strict observance of all laws and of maintaining high standards of operation in the public interest.

Industry Economics.—The industry pay roll totalled $332,931,000 in 1950, covering 81,155 employees. The average number of production workers was 58,054 and they drew down $219,445,000 for 117,882,000 man hours. The value added by the manufacturer was reported at $937,463,000, which was slightly more than 1% of the value added by manufacture of all products made in the United States during 1950.

Purchases of agricultural products were estimated at nearly $300,000,000 for the year, mainly for malt, corn products, rice and hops. Purchases of cans, bottles, kegs, labels, transportation and various items of supplies, equipment, machinery and services were in addition to this.

Federal excise taxes, at $8 per barrel, and special taxes on malt beverages for fiscal 1951 totalled $669,470,889, bringing the cumulative total since relegalization (April 7, 1933) to $8,172,163,097. State and local taxes and licence fees in the fiscal year 1951 were estimated at $215,000,000, raising the cumulative figure for that revenue to about $2,730,000,000. Combined public revenue since 1933 thus had passed the $10,900,000,000 mark. (*See* also LIQUORS, ALCOHOLIC.)

(E. V. LH.)

Brewster, (Ralph) Owen

(1888–), U.S. senator, was born on Feb. 22 at Dexter, Me. He graduated from Bowdoin college in 1909 and received his law degree at Harvard university in 1913, after which he practised law at Portland, Me. He was a member of the Maine house of representatives for the terms 1917–19 (resigning in 1918 to enter military service) and 1921–23, state senator from 1923 to 1925 and governor of Maine for two terms (1925–29). Elected to the U.S. house of representatives in 1934 from the third Maine district as a Republican, he opposed a number of New Deal measures, including the packing of the supreme court. He was elected to the U.S. senate in 1940 for the term 1941–47 and was re-elected in 1946 for the term 1947–53. In the senate he continued in opposition to much of the Democratic administration's program.

After the outbreak of the Korean war in 1950, Brewster repeatedly attacked the administration's conduct of the war, and urged that Gen. Douglas MacArthur be given authority to use the atom bomb and (after the Chinese intervention) cross the Manchurian border if necessary. On May 8, 1951, he succeeded to the senate foreign relations committee seat left vacant by the death of Sen. Arthur H. Vandenberg. During the MacArthur hearings, Brewster assailed Secretary of State Dean Acheson's policy in China as full of "deceit" and criticized Pres. Harry S. Truman's removal of MacArthur as ill-advised. On Oct. 18 he was one of three senators on a foreign relations subcommittee who voted against confirmation of Philip C. Jessup as U.S. delegate to the United Nations.

Bridge, Contract: *see* CONTRACT BRIDGE.

Bridges, (Henry) Styles

(1898–), U.S. senator, was born at West Pembroke, Me., on Sept. 9. He graduated in 1918 from the University of Maine and, after teaching at Sanderson academy, Ashfield, Mass., he became a county agricultural agent and a specialist on crops and soils for the University of New Hampshire. In 1934 he was elected governor of New Hampshire for the term 1935–37. In 1936 he was elected Republican senator from New Hampshire for the term 1937–43 and was re-elected for the terms 1943–49 and 1949–55.

In the senate Bridges voted consistently with the Republicans against New Deal measures, excepting the Selective Service act and the various defense and war appropriations. A bitter critic of Secretary of State Dean Acheson and his foreign policy, Bridges was denounced by Pres. Harry S. Truman in 1950 as a Kremlin asset in the cold war. On Jan. 15, 1951, Bridges urged that the U.S. sever relations with the U.S.S.R. In June he criticized conduct of the Korean war as a policy of "kill, kill, kill and hope somebody will be willing to negotiate." On Aug. 19 he, with seven other Republicans of the senate armed services and foreign relations committees, denounced President Truman's dismissal of Gen. Douglas MacArthur as proof that the administration's far eastern policy had been "the most desolate failure in the history of our foreign policy." Primarily an internationalist, however, Bridges disagreed with both former Pres. Herbert Hoover and Sen. Robert A. Taft during the "great debate" on U.S. foreign policy in 1951.

Bridges.

The world's longest spans of the various types built up to 1952 are listed in the table.

United States.—The Delaware Memorial bridge over the Delaware river near Wilmington, Del., completed in 1951, was the world's sixth longest suspension bridge, with a main span of 2,150 ft. The west anchorage foundations required a caisson 95 x 221 ft. in plan, the largest in area ever built. The east anchorage

World's Longest Spans by Type of Bridge

Type	Bridge	Location	Year Completed	Span
Cable Suspension	Golden Gate	San Francisco	1937	4,200 ft.
Transporter Bridge	†Sky Ride	Chicago	1933	1,850

THROWING A ROPE to guide a truss into place on the Delaware Memorial bridge. Linking Delaware and New Jersey, the bridge had the sixth longest span in the world at its dedication, Aug. 15, 1951

foundation, built in an open cofferdam, also required the largest tremie seal, 99 x 225 x 32 ft. deep, poured in a 7½-day continuous operation. The total cost was $44,000,000.

The Chesapeake Bay bridge, just north of Annapolis, Md., constructed in 1950–52 at a cost of $42,600,000, was 21,286 ft. long, including a 1,600-ft. suspension span, a 780-ft. through cantilever truss and a long series of deck cantilever trusses. The underclearance was 186½ ft. at the suspension span. A novel construction was used for 28 piers, each consisting of four bell-bottomed cylindrical legs joined by diaphragms. These caissons were set on steel H-piles, driven as much as 135 ft. into the bay bottom. Giant pile hammers were required to drive these piles until their tops were under 60 ft. of water. All steelwork was erected without the use of falsework. Truss spans were assembled in an erection dock adjacent to one span and were then floated into position.

Legislation enacted in New Jersey and Pennsylvania in 1951 authorized an $84,000,000 suspension bridge to be built across the Delaware river between Philadelphia, Pa., and Camden, N.J. The new toll structure was to supplement the existing Philadelphia-Camden bridge, on which traffic had reached 23,000,000 vehicles annually, and was to be built under a new Delaware river port authority. Another Delaware river crossing authorized in 1951 by the two states would connect the Pennsylvania turnpike and the New Jersey turnpike between King of Prussia, Pa., and Bordentown, N.J.

The Delaware River Joint Toll Bridge commission completed plans in 1951 for the construction of three more interstate toll bridges over the upper portion of the Delaware river between Pennsylvania and New Jersey. The largest was to be an $8,300,000 span just north of the Delaware water gap at Stroudsburg, Pa.

Plans were authorized in 1951 for a $60,000,000 bridge to carry the New York State Thruway over the Hudson river at Tarrytown, N.Y. A novel feature called for the use of hollow concrete piers for buoyancy to reduce the load on the deep supporting piles. In a total length of five miles, the principal span would be a 1,100-ft. steel girder tied-arch, exceeding existing spans of this type.

The George P. Coleman Memorial bridge over the York river at Yorktown, Va., constructed in 1950–52 at a cost of $8,000,000, was featured by two 500-ft. swing spans in tandem to provide, in combination, a channel of 450-ft. horizontal clearance. One of the caissons, 110 ft. high, was sunk through 80 ft. of water and 70 ft. farther into the river bottom.

Plans made in 1951 for a 10-mi. by-pass expressway through Toledo, O., included a $16,700,000 central bridge section across the Maumee river. Construction was started in 1951 on the $21,000,000 Tampa Bay bridge in Florida.

Work was started in 1951 on the $6,000,000 highway bridge across Bay St. Louis on the Gulf coast of Mississippi.

In Arkansas an improvement district was authorized in 1951 for the construction of a proposed $7,000,000 interstate toll bridge over the Mississippi river at Helena.

The $12,000,000 Penrose avenue bridge across the lower Schuylkill river in south Philadelphia, completed in 1951, had a 680-ft. main span of arched cantilever type.

In Louisiana a survey was authorized in 1951 for a new Mississippi river bridge at New Orleans, estimated to cost $44,000,000.

A large concrete bridge with arch spans of 230, 319 and 230 ft. was built in 1951 to carry the Colorado freeway across the Arroyo Seco at Pasadena, Calif. It was adjacent to the historic concrete arch bridge built in 1913 to carry Colorado street across the same valley. The new bridge, costing $2,377,000, was 1,364 ft. long, on a curve, and had a deck width varying from 93 to 171 ft.

A $2,600,000 bridge was constructed in 1950–51 between Squantum and Long Island in Boston harbour. The 250-ft. centre span was assembled on two barges about four miles away, towed to position and then lowered into place with the ebb tide.

A pedestrian bridge over the Harlem river in New York city, erected in 1951, had a plate-girder lift span of 312 ft.

New U.S. records for plate-girder spans were set by two bridges (1951) on the New Jersey turnpike crossing the Passaic river and the Hackensack river, respectively, with girder spans of 375 ft. (The Bonn-Beuel bridge over the Rhine in Germany, completed in 1949, had a plate-girder span of 643 ft., and the Rhine bridge at Cologne, completed in 1948, had a 605-ft. girder span.)

The first prestressed concrete bridge to be completed in the U.S. (1950) was a highway bridge in Madison county, Tenn., with beam spans of 20 and 30 ft. The bridge was opened to traffic less than two weeks after erection started. A saving of 40% over the conventional design was reported.

The second prestressed bridge, the Walnut Lane bridge in Philadelphia, Pa., was completed early in 1951. The concrete deck was carried on thirteen 160-ft. main span precast girders and fourteen 74-ft. precast girders in the side spans.

California's first prestressed concrete bridge was a 110-ft. span pedestrian crossing over the Arroyo Seco in Los Angeles.

Construction was commenced in 1951 on a new four-track vertical lift bridge for the New York Central railroad to span the Harlem river in New York city. The estimated cost was $10,000,000, and completion was scheduled for 1954. The lift span was to be 340 ft., and would rise to a height of 135 ft. above the water.

A bridge 3,050 ft. long, made up of 25 deck plate-girder spans 122 ft. long, was built over dry land near Whitney, Tex., to carry the Missouri-Kansas-Texas railroad across a future lake to be formed by the Whitney dam and reservoir.

The Illinois Central railroad bridge over the Ohio river at Cairo, Ill., built in 1887–89, was replaced with new and heavier spans in 1951. Each new span was built on special falsework alongside the span it was to replace. It took only 57 min. to roll the old 518-ft. span out of the way, and then the new span was rolled into position.

Canada.—The Duplessis highway bridge over the St. Maurice river at Three Rivers, Que., collapsed suddenly at 3 A.M. on Jan. 31, 1951, with the loss of four lives. Four of the eight continuous girder spans of the western half of the structure dropped into the icy river, when the temperature was −30°. The structure had been completed in 1947 at a cost of $3,000,000. The failure was charged to the use of a poor quality steel tending to brittleness at low temperatures. Similar fractures at identical locations in the spans had been discovered a year earlier and had been repaired.

The Anlaw bridge over the Skeena river, near Hazelton, B.C., replacing a timber suspension bridge of 190-ft. span, was constructed in 1950. The difficult problem of bridging the steep canyon was solved by using a light, temporary Bailey bridge in lieu of falsework.

Brazil.—A combined railway and highway bridge over the São Francisco river between Propriá and Colegio, built in 1951–52 by the National Railway department of Brazil, had a total length of 4,500 ft. The estimated cost was $6,150,000. Thirty-three concrete piers carried ten steel girders of the Wichert type, each continuous over three spans of 120, 164 and 120 ft., and four simple girder spans of 110 ft.

Germany.—The outstanding bridges built in Germany after World War II were four bridges over the Rhine—at Frankenthal, Cologne-Deutz, Bonn-Beuel and Cologne-Muelheim.

The Frankenthal bridge was the only Rhine crossing of the *Autobahn* to be rebuilt up to the close of 1951. The original construction commenced in 1939, but was abandoned in 1941 when the bridge collapsed during erection, with 36 lives lost, shortly before the scheduled completion. This was recorded as the most serious and most mysterious disaster in the history of German bridgebuilding. The bridge was rebuilt in 1950, following the original design. The structure was a continuous plate girder with two spans of 482 and 528 ft., respectively. The bridge was notable for the record dimensions of the plate girders, with a depth of 22 ft., flange width of 4 ft. and flange thickness of 10 in. These were the heaviest plate girders in the world, and their proportions and oversize dimensions proved highly uneconomical.

The Cologne-Deutz (1948) and the Bonn-Beuel (1949) bridges over the Rhine, with continuous plate girder spans of 605 and 643 ft., respectively, established new world records and represented striking new conceptions in long-span continuous girder design. The parabolically shaped bottom flanges formed strong haunches over the inner piers and cut the depth in the centre to a minimum of $\frac{1}{65}$ of the span. This extraordinarily shallow section was made possible by cantilever erection to minimize bending moments at mid-span and by the use of box-girder and T-beam cross-sections, with the steel deck plates and bottom lateral bracing designed to participate as girder flanges. This yielded a highly efficient and economical design.

The rebuilt Cologne-Muelheim suspension bridge, with main span of 1,034 ft., was opened to traffic in Sept. 1951. This was the longest span on the European continent, since the Cologne-Rodenkirchen bridge (1941) of 1,244-ft. span had not been rebuilt. The new bridge was an externally anchored suspension bridge, whereas the old bridge (1929) was self-anchored. The change in anchorage permitted a lighter and shallower stiffening girder to be used, yielding improvement in both economy and appearance. (*See* also ROADS AND HIGHWAYS.) (D. B. S.)

British Borneo.

British-administered territories in Borneo consist of the colonies of North Borneo (including island of Labuan) and Sarawak, and the protected state of Brunei. Areas: North Borneo, 29,417 sq.mi.; Sarawak *c.* 50,000 sq.mi.; Brunei 2,226 sq.mi. Pop.: North Borneo (1950 est.) 350,000, including 67,000 Chinese; Sarawak (1947 census) 546,385 including 691 Europeans and 145,158 Chinese, (1950 est.) 570,000; Brunei (1950 est.) 42,000. Language: various, Malay serving as a lingua franca. Religion: Moslem and pagan. Governors in 1951: North Borneo: Sir Ralph Hone; Sarawak: Anthony F. Abell (also high commissioner for Brunei).

History.—In Sarawak in Feb. 1951 the secessionists agreed to abandon their activities in the face of the Communist threat to Asia, and Clement Attlee, the British prime minister, renewed assurances of the British government's policy of helping the people toward self-government. On May 31 the new sultan of Brunei, Omar Ali Saifuddin, was crowned with full ceremony. In both Sarawak and North Borneo the soaring prices for raw materials ensured another prosperous year. Sarawak proposed to carry out the whole of its £4,500,000 development plan from its oil revenues, and in North Borneo the favourable balance of trade, which had risen from £500,000 in 1949 to £5,000,000 in 1950, continued to improve. A North Borneo development plan was to cost more than £5,000,000, some of which was to be paid for under the Colombo plan. Its progress was, however, much hampered by shortage of materials and labour; the problems concerning the encouragement of immigration had not been solved, though several hundred people had been brought in from the Cocos and Keeling islands. A contingent of Dyaks from North Borneo continued to do valuable service in Malaya in helping the troops to track down bandits in the jungle.

Education.—(1950) Primary school attendance, secondary attendance in parentheses: North Borneo 19,140 (484); Sarawak 41,000 (8); Brunei 4,496.

Finance and Foreign Trade.—Currency: Malayan dollar, valued at 32.67 cents U.S.

	North Borneo	Sarawak	Brunei
	(In millions of Malayan dollars)		
Budget (1951 est.)			
Revenue	17.3*	20.1	26.1
Expenditure	11.2*	19.1	10.9
Imports (1950)	46	52.5†	20.5
Exports (1950)	92	50†	60.3

*Excluding development: revenue $11,400,000; expenditure $18,100,000. †1949.

Principal production figures (1950): North Borneo: rubber 23,900 tons, rice 25,000 tons, copra 32,337 tons; Sarawak: crude oil 56,601 tons, refined petroleum 1,854,615 tons, rubber 55,765 tons, timber (1949) 36,607 tons; Brunei: crude oil 4,051,009 tons, rubber 2,496 tons. (K. G. B.)

British Columbia.

The most westerly of Canada's ten provinces, British Columbia has an area of 366,255 sq.mi., of which 6,976 sq.mi. are water. British Columbia is the third largest province in area and is bounded on the west by the Pacific ocean and the Alaskan panhandle; on the east by the province of Alberta; on the south by the 49th parallel; and on the north by the 60th parallel.

The total population as at June 1, 1950, was estimated to be 1,138,000 (1941 census, 817,861). The 1951 census taken in June showed a population of 1,153,059, an increase of 41% over 1941. The 1941 census indicated 443,394 urban dwellers and 374,467 rural dwellers. Approximately 70% of the population dwelt in the southwestern corner of the province. The chief cities and their preliminary 1951 populations were: Vancouver (340,272), metropolitan Vancouver (524,339); Victoria, the capital (50,774); and New Westminster (28,390).

History.—In the second session of the 22nd parliament of British Columbia, Feb. 20, 1951, to April 18, 1951, the following measures were passed: an act to make provision for the common defense and protection of the public peace, health and security in the event of enemy action or civil disaster; an amendment to the Coal and Petroleum Products Control Board act, providing for the repeal of the price-setting powers of this board; an act authorizing the borrowing of $12,000,000 to be used in the purchase or building of public buildings and equipment; an act authorizing the borrowing of $5,000,000 to be used in the construction of schools; an amendment to the Public Utilities act providing for a three-member milk board instead of a one-member board; an act validating the incorporation of the corporation of the District of Central Saanich.

Hospital insurance premiums were raised $9 bringing a single person's contributions to $30 from $21, and a married person's premiums to $42 from $33. In addition a coinsurance policy was introduced; the maximum payment in any one year would be $35 per single person or per family unit. In April A. D. Turnbull announced social allowances were to be increased $5 per month per single person, $10 for a unit of two persons and $1 for each additional person.

The Aluminum Company of Canada started construction of its vast development in British Columbia in the Kemano-Kitimat area. In its initial program it was expected the plant would have an annual capacity of 80,100,000 tons. The $27,000,000 pulp plant of the Columbia Cellulose company 9 mi. S. of Prince Rupert was formally opened on June 12. The B.C. Power commission's 33,000-h.p. development at Whatshan lake was officially opened on June 25 by Premier Byron Johnson.

A special session of the legislature was held Oct. 25–Oct. 27 to deal with matters pertaining to old age pensions. Enabling legislation was passed allowing the province to enter into agreement with the federal government to take advantage of the Federal Old Age Assistance act and the Federal Blind Persons Allowance act.

Members of the provincial executive council, or cabinet, and their portfolios at the close of 1951 were: B. I. Johnson, premier and president of the council; G. S. Wismer, attorney general; E. T. Kenney, lands and forests; H. Anscomb, finance; H. R. Bowman, agriculture; R. C. MacDonald, mines and municipal affairs; E. C. Carson, public works; L. H. Eyres, railways, trade and industry and fisheries; J. H. Cates, labour; W. T. Straith, education and provincial secretary; A. D. Turnbull, health and welfare.

Education.—During the school year ending June 30, 1950, 164,212 students were enrolled, in the elementary (104,095), elementary-senior-junior high (13,626), superior (2,902), junior, junior-senior and senior high (43,589) schools of the province. Teaching staffs comprised 5,873 teachers: in the elementary 3,341, elementary-senior-junior high 487, superior 110, junior, junior-senior and senior high 1,875 and 60 unclassified. Higher education is provided by the University of British Columbia, a provincially endowed institution, two teacher training schools located in Vancouver and Victoria, a vocational institute at Vancouver and a junior college at Victoria.

The total net cost for the enrolment of 164,212 was $45,377,092. The deputy minister and superintendent of education was F. T. Fairey.

Communications.—The total highway mileage as of March 31, 1950, excluding the Alaska highway, was 22,711, of which 10,310 mi. were surfaced, 9,832 mi. were improved earth and 2,569 mi. unimproved earth. Railway mileage as of Dec. 31, 1950, was 4,813 of main line track and 1,215 of sidings. During 1950 approximately 5,016,020 tons of cargo were loaded at British Columbia ports on vessels destined for foreign countries, while 2,851,311 tons of cargo received from foreign countries were unloaded from vessels at local ports. In 1949 the total number of telephones, 254,325, included 103,217 on automatic switchboards.

On Oct. 31, 1950, there were 187,580 passenger cars and 64,087 commercial vehicles registered within the province.

Finance.—On March 13, 1951, Herbert Anscomb, minister of finance, reported that revenue collected for the fiscal year ended March 31, 1950, was $111,302,868; expenditures were $107,983,132; the net debt at Dec. 31, 1950, was $171,211,990, an increase of $25,111,622 over Dec. 31, 1949. Anticipated revenues were $118,502,890 and expenditures $118,269,088, for the fiscal year ending March 31, 1952.

Agriculture, Fisheries, Mining, Forestry.—Preliminary provincial departmental estimates indicated that all four chief basic industries, viz., agriculture, forestry, fisheries and mining, would reach new all-time value highs during 1951. Price increases accounted for a major portion of the increases.

Table I.—*Economic Activity in British Columbia*

	Unit	1950	1949	1951 Preliminary estimates
AGRICULTURE:				
Total value of production	$	136,690,400	139,960,563	148,800,000
Livestock	$	24,144,000	19,708,000	26,000,000
Poultry products . .	$	16,976,000	19,429,000	19,000,000

Table II.—*Principal Manufacturing Industries of British Columbia*

Industry	Gross value of Products 1949	1948
Sawmills	$209,607,511	$224,664,156
Pulp and paper	69,925,185	75,474,342
Fish processing.	55,553,356	56,309,747
Slaughtering and meat packing	49,120,931	43,419,968
Petroleum products	34,409,015	30,656,627
Fertilizers.	28,060,751	26,119,263
Sash, door and planing mills	26,522,103	23,496,534
Veneers and plywoods	25,239,202	28,320,902
Miscellaneous food industries.	23,057,601	17,744,239
Fruit and vegetable preparations	22,622,366	24,244,004
Total all manufacturing industries	959,008,088	985,592,702

Manufacturing.—Preliminary statistics relating to the manufacturing industries of the province indicated that the 1950 gross value of production would be higher than the previous all-time high established during 1948. This new all-time high was well maintained during 1951 with a large increase in pulp and paper production.

FILMS OF 1951.—*British Columbia—A Friend at the Door* (National Film Board of Canada); *Vancouver Island* (revised), *Peach Time in the Valley* (British Columbia Government Travel Bureau); *British Columbia* (Paul Hoefler Productions). (G. T. H.)

British East Africa.

This term is used to include Kenya (colony and protectorate), Tanganyika (trust territory) and Uganda, Zanzibar and Somaliland (protectorates). Kenya: 224,960 sq.mi.; pop. (1950 est.) 5,500,000; capital, Nairobi. Tanganyika: 362,688 sq.mi.; pop. (1950 est.) 7,600,000; capital, Dar es Salaam. Uganda: 93,981 sq.mi.; pop. (1950 est.) 5,125,000; capital, Entebbe. Zanzibar: 1,020 sq.mi.; pop. (1950 est.) 270,000; capital, Zanzibar. Somaliland: 67,936 sq.mi.; pop. (1950 est.) *c.* 500,000; capital, Berbera. Governors, 1951: Kenya, Sir Philip Mitchell; Tanganyika, Sir Edward Twining; Uganda, Sir John Hall and Andrew Benjamin Cohen; Zanzibar, Sir Vincent Glenday and John Dalzell Rankine; Somaliland, Sir Gerald Reece.

History.—James Griffiths, secretary for the colonies, visited Kenya in May 1951 to discuss constitutional developments, about which talks had already taken place between the governor and the leaders of the European, African and Asian communities. The Europeans wanted to retain a voting power in the legislative council equal to that of the other communities combined, but the non-European groups were reluctant to concede this. As a result of Griffiths' visit the council was to be enlarged after May 1952 to 54 members, with 26 on the official side and 14 Europeans, 6 Africans, 6 Indians and 2 Arabs, a total of 28, on the unofficial side; the seat on the executive council designated as being in the African interest would be filled by an African when it next fell vacant. These changes, announced in the house of commons on May 31, 1951, were interim measures pending a fuller constitutional review.

An African defense facilities conference, convened by Great Britain and South Africa, was held at Nairobi in August. It was attended by representatives of Belgium, Ethiopia, France, Italy, Portugal and Southern Rhodesia and by a United States observer; Egypt had declined an invitation because of its disputes with Britain. Unanimous recommendations were made to ensure the rapid movement of troops and supplies, if required, to East and central Africa. An ordinance passed early in the year in Kenya provided for compulsory national service (military and civil) for all British subjects and protected persons.

On Jan. 9 Viscount Jowitt, the lord chancellor, inaugurated at Nairobi a court of appeal for East Africa and was given the freedom of the city. Sir Barclay Nihill was appointed president of the court, which had jurisdiction covering Kenya, Tanganyika, Uganda, Zanzibar, Aden, Somaliland Protectorate and Seychelles.

A revised five-year development plan for Tanganyika to cost £24,000,000 was introduced in Feb. 1951 which included as an immediate project the extension 60 mi. westward of the Southern Province railway. Meanwhile the decision was taken by the British government to write off £36,000,000 advanced to the Overseas Food corporation for the peanuts scheme, to dispose of the corporation's surplus assets and to transfer the responsibility for its future, very restricted operations in East Africa from the ministry of food to the colonial office. In October the Colonial Development corporation reported the finding of a 200,000,000-ton coal field of good quality in the Ruhuhu valley with adjacent iron deposits.

A report on constitutional reform in Tanganyika, published in August, recommended the maintenance of official control in an enlarged legislative council of 42 members; interracial partnership was to be implemented by an equal division of the 21 unofficial seats among Europeans, Asians and Africans, a recommendation unpopular with some, though by no means all, Europeans. Less controversial, but of equal importance, were the comprehensive proposals for a modern system of local government, with district and county councils and regional administrations. These were designed to encourage interracial cooperation in local affairs, to decentralize administration and to provide a sound, democratic foundation for the steady development of self-government at the centre.

In Jan. 1951 the *lukiko,* the "parliament" of the Buganda kingdom (part of Uganda), underwent a measure of reform, the proportion of elected representatives being increased to 40 out of a total of 89. It was announced in April that the first cotton mill in East Africa was to be built in Uganda by a new company, Nyanza Textile Industries, Ltd., with a capital of £1,500,000, of which £600,000 would be provided by the Uganda government and the balance by Lancashire interests. Plans were announced in September for the reorganization of the cotton-growing industry itself. The scheme provided for the buying up by the government and closing of 35 redundant ginneries and the expansion of co-operative ginning by the growers. All the lint would continue, as at present, to be sold by the ginneries to the lint marketing board. The latter had, by the end of the 1950–51 season, accumulated a stabilization fund of £22,000,000 so that plenty of money was available for expanding the industry.

Zanzibar's chief problem remained the "sudden death" disease in cloves. It had been decided in 1950 not to proceed with wholesale cutting out of affected trees partly because of the inevitable political repercussions and partly because it would have cost £1,000,000. During 1951, however, scientists diagnosed the cause of the disease and it was hoped that, as a result, alternative methods of control might be developed. In spite of the disease a bumper crop was harvested; in very good years it was not possible to pick the whole crop and the effect of "sudden death" was felt only when crops were normal or subnormal. Proposals for elections in the Arab and Indian communities were still under consideration at the end of the year.

Initial opposition in Somaliland to the setting up of local authorities and district councils in the tribal areas disappeared and the native authority system was successfully established. Of even greater importance was the arrival of an expert in October to carry out a survey for large-scale irrigation. On the coast of the Red sea hopeful experiments were started in growing dates.

Finance and Trade.—Currency: East African shilling, divided into 100 cents and valued at 14 cents U.S. (1951).

	Revenue*	Expenditure*	Imports, 1950	Exports, 1950
Kenya	£13,400,000	£12,500,000	£31,700,000	£19,700,000
Tanganyika	14,300,000	15,000,000	28,000,000	26,000,000
Uganda	12,500,000	11,600,000	15,400,000	29,000,000
Zanzibar	1,470,000†	1,030,000†	3,900,000	5,100,000
Somaliland	584,000	1,200,000	1,200,000	732,000

*1951 estimates. †1950 actual.

Principal exports: Kenya—wheat, maize, sisal, pyrethrum, tea, gold, silver, kyanite; Tanganyika—diamonds, sisal, hides; Uganda—raw cotton, sugar; Zanzibar—cloves, coconut oil, oil cake; Somaliland—hides and skins, livestock, gums and ghee. (K. G. B.)

British Empire: *see* COMMONWEALTH OF NATIONS.

British Guiana.

A British colony, British Guiana is on the northeast of the continent of South America between Venezuela, Brazil and Surinam. Area: *c.* 83,000 sq.mi. Pop.: (1946 census) 369,678, excluding *c.* 6,000 Amerindians in remote districts; (1950 est.) 425,156. Language: English; various East Indian languages also spoken. Religion: 60% Christian; non-Christians are mainly Hindu or Moslem. Principal towns (pop., 1950 est.): Georgetown (cap., 84,794); New Amsterdam (11,812). Governor in 1951: Sir Charles Woolley.

History.—During 1951 a mission from the Colonial Development corporation spent three months investigating the possibility of developing the rice industry, which was stimulated by an arbitration award on the prices to be paid for rice by other British Caribbean colonies. Sugar production was maintained, and the bauxite industry completed large capital works. Legislation to assist the starting of new industries by relief from import duties and income tax came into effect. Evidence of further social progress was found in the opening of the new Queen's college, which provided secondary education for 500 boys, and in the inauguration of the potable water supply scheme for Georgetown.

A commission on constitutional development headed by Sir John Waddington recommended the introduction of full adult suffrage. Other proposals, which were accepted in principle by the secretary of state for the colonies, provided for a court of policy (formerly executive council) consisting of the governor, 3 ex officio members, 5 or possibly 6 ministers from the house of assembly and a minister without portfolio from the state council; a house of assembly consisting of 3 ex officio, 24 elected members and a speaker; and a state council of 6 nominated members, drawn equally from the three counties, and 3 appointed on the recommendation of the majority and the minority in the house of assembly.

Education.—Pupils in elementary schools (1950): 74,153; expenditure on elementary education: B.W.I. $2,125,128.

Finance, Trade and Production.—Currency: British West Indian dollar, valued in 1951 at 58.33 cents U.S. Budget (1951 est.): revenue B.W.I. $24,311,822; expenditure B.W.I. $24,224,018, excluding colonial development funds. Foreign trade (1950): imports B.W.I. $55,057,592; exports, including re-exports, B.W.I. $50,254,942. Principal exports: sugar, bauxite, rum, rice, diamonds, timber, balata. Production: sugar crop (1951) 205,688 tons; bauxite (1950) 1,583,417 tons. (P. H-MY.)

British Honduras.

A British colony in Central America bounded by Mexico and Guatemala, British Honduras has an area of 8,598 sq.mi. Pop.: (1946 census) 59,220; (1950 est.) 67,000. Language: English, Spanish and Indian dialects. Religion: mainly Roman Catholic. Chief towns (pop., 1946): Belize (cap., 21,886); Stann Creek (3,414). Governor in 1951, Sir Ronald Garvey.

History.—The development program continued to make considerable strides. In April 1951 the first export of 12,000 stems of bananas was made to the United States and Canada from the plantation established by the Colonial Development corporation in the Stann Creek district. In October 8,300 stems were shipped to the United Kingdom. Progress was made with the ramie fibre project in the western district. Exports of timber, citrus fruit and chicle all increased substantially throughout 1951.

Grants under the Colonial Development and Welfare acts continued on an increasing scale, and special attention was paid to the construction of feeder roads to open up new territory for smallholders. Progress was made on the road from Roaring Creek to Middlesex which was to give land communication between north and south.

A major political issue discussed was whether the colony should join in any federation of the British Caribbean colonies such as that recommended in the report of the standing closer association committee which had been published in March 1950. The People's United party conducted a strong campaign against federation.

Education.—Schools: 92 primary and 5 secondary schools (65 controlled by the Jesuit mission). Attendance: primary schools, 13,526; secondary 672.

Finance and Trade.—Currency: British Honduras dollar, valued in 1951 at 70 cents U.S. Budget (1951 est.): revenue $4,712,699; expenditure $4,612,699. Foreign trade (1950): imports $8,076,417; exports $4,594,-

36. Principal exports: timber, coconuts, chicle and grapefruit.

British South African Protectorates.

The three territories in southern Africa which are not part of the Union of South Africa, Basutoland, Bechuanaland protectorate and the protectorate of Swaziland, are generally referred to as the High Commission Territories in South Africa.

	Area (sq. mi.)	Population (1950 est.)	Capital
Basutoland	11,716	574,000	Maseru
Bechuanaland	c. 275,000	289,000	Mafeking
Swaziland	6,705	197,000	Mbabane

High commissioners (1951): Sir Evelyn Baring and (from Oct. 2) Sir John Le Rougetel. Resident commissioners: (Basutoland) E. P. Arrowsmith; (Bechuanaland) E. B. Beetham; (Swaziland) D. L. Morgan.

History.—Patrick Gordon Walker, British secretary of state for commonwealth relations, visited the territories in Feb. 1951. He met chiefs and other notables and addressed representative gatherings.

Basutoland.—The report of the special commissioner, G. I. Jones, who inquired into the increase in "medicine" murders, was published in 1951. He found that the primary cause was the Basuto belief in the medicinal efficacy of human flesh. The revival of this belief was attributed to changes in chieftainship which had adversely affected the status and security of men in authority. The report recommended *inter alia* closer association of the Basuto people with the work of government and reforms in the system of native administration. These proposals were accepted by the secretary of state. After an inquiry into the working of native courts, steps were taken to improve their procedure and to record native law and custom.

Ma'Ntsebo, the regent, accompanied by advisers, paid her first visit to London in Oct.–Nov. 1951. She saw Gordon Walker and Lord Ismay, who succeeded him, and sought a declaration that Basutoland would never be handed over to the Union of South Africa without the consent of the Basuto; but neither minister was prepared to go beyond earlier assurances of prior consultation.

Bechuanaland.—The Bamangwato tribe was disturbed by the effects of the banishment of its two leading figures, Tshekhedi Khama and Seretse Khama, following the latter's marriage to a white woman. Tshekhedi's desire to return led to debates, in June, in both houses of parliament at Westminster, and to the dispatch from Britain of three observers to report on the attitude of the tribe to Tshekhedi's return. The observers found that an overwhelming majority was opposed to return, but the Conservative government announced in December that it was its intention to allow Tshekhedi to return ultimately to live as a private person in the reserve.

Swaziland.—Legislation provided a firmer legal basis for the system of indirect rule in native administration on the lines already adopted in other British dependencies. The paramount chief and his council were recognized as the native authority with power to run a series of native courts. A national treasury, financed from local revenue, was established under the general control of the native authority. These laws marked a new stage in local self-government reached after years of consultation with the tribal leaders.

The African demand for primary and secondary education continued to grow. An increasing number of children were enrolled and new buildings erected, including a new European school. Plans for further development were under consideration. Extensions of medical facilities cost £71,000. A leper survey, involving the examination of 31,000 persons, was conducted with satisfactory results. (*See* also SOUTH AFRICA, UNION OF.)
(JU. L.)

Education.—Schools, with the numbers attending in parentheses, were in 1950:

	Primary	Secondary and postprimary	European
Basutoland	899 (88,236)	10 (1,012)	6 (116)
Bechuanaland	152 (16,346)	1 (34)	9 (224)
Swaziland	194 (13,588)	13 (670)	7 (568)

A small private university from which students took external degrees of the University of South Africa was maintained by the Roman Catholic mission at Roma, Basutoland.

Finance and Trade.—Currency: South African pound (£[S.A.]1 = £1 sterling).

	Budget est., 1951–52*		Foreign trade, 1950†	
	Revenue	Expenditure	Imports	Exports
Basutoland	£938,921	£977,624	£2,555,614	£2,588,120
Bechuanaland	505,293	559,120	1,487,147	1,626,014
Swaziland	529,120	518,588	1,090,793	2,144,851

*Excluding Colonial Development fund expenditure estimated at: Basutoland £107,397; Bechuanaland £155,239; and Swaziland £144,797. Deficits met from accumulated surpluses.

†Excluding earnings of labourers remitted from neighbouring territories for which no estimate was available; the total was believed to be considerable.

Principal exports: *Basutoland:* livestock, grain, wool, hides and skins. *Bechuanaland:* beans, dairy produce, livestock, hides and skins, gold, *Swaziland:* livestock, tobacco, asbestos (32,667 short tons in 1950), gold, peanuts, tung oil.

British West Africa.

This term includes the following territories on the west coast of Africa: Gambia, colony and protectorate; Gold Coast, colony and protectorate; Togoland under United Kingdom trusteeship, administered with the Gold Coast; Nigeria, colony and protectorate; Cameroons under United Kingdom trusteeship, administered with Nigeria; Sierra Leone, colony and protectorate.

Governors (Dec. 31, 1951): Gambia, P. W. Harris; Gold Coast, Sir Charles Arden-Clarke; Nigeria, Sir John Macpherson; Sierra Leone, Sir George Beresford Stooke.

History.—The year 1951 saw constitutional development in

GOLD COAST citizens preparing to vote in the British colony's first parliamentary elections in Feb. 1951. The nationalist Convention People's party, pledged to end British support, won 34 of the 38 seats subject to popular vote

	Area (sq.mi.)	Population (1950 est.)	Chief towns
Gambia	4,074	271,000	Bathurst (cap., 21,152)
Gold Coast . . .	78,802	3,788,000	Accra (cap., 135,926), Kumasi (78,483), Sekondi-Takoradi (44,557)
Togoland	13,041	393,000	. . .
Nigeria	338,593	24,000,000	Lagos (cap., 250,000), Ibadan (335,500), Kano (102,000)
Cameroons . . .	34,081	1,025,000	. . .
Sierra Leone . . .	27,925	1,865,000	Freetown (cap., 64,576)

all four British territories, in part the implementation of decisions announced in 1950.

Gambia.—The new constitution came into operation and elections in Bathurst for three members of the legislative council took place on Oct. 25. It was also announced that the number of unofficial members of the executive council would be increased to four, to be selected from the eight unofficial members of the legislative council, and that two of them would be members of government without portfolio and receive remuneration.

Gold Coast.—The year saw the inauguration of the remarkable political experiment in the Gold Coast, the new constitution which established a legislative assembly of 84 members (75 elected) and an executive council, with the governor as president and 11 members, 8 of whom were chosen from the assembly and were removable at its instance. Elections for the assembly were held during the period Feb. 5–10. There was no disorder and few election offenses were reported. About 80% of the electorate were illiterate.

The three main political parties were the Convention People's party led by Kwame Nkrumah, the United Gold Coast convention led by J. B. Danquah and the much smaller and, as events proved, ineffective National Democratic party. In the 33 rural seats, for which there were 89 candidates, the Convention People's party secured 1,946 votes and 29 seats against 745 votes and 4 seats for all others, while in the municipalities of Accra, Kumasi, Sekondi-Takoradi and Cape Coast they polled 58,886 votes against 5,500 for the rest and secured all five seats. The new assembly had an average age of just below 40, and of its 84 members 22 were graduates and 40 had received no post-primary education. Nkrumah, who was elected for Accra with a vote of 20,780, was at the time serving a prison sentence which was not due to end until November (having been convicted on charges of violating emergency regulations), but on Feb. 12 Sir Charles Arden-Clarke, the governor, remitted the remainder of the sentence.

On Feb. 26 Arden-Clarke submitted to the assembly the names of Nkrumah as leader of government business, and seven others as ministers.

Nigeria.—A new constitution was promulgated on June 29. It established legislatures in each of the three regions as well as a central legislature, the members of which would be elected by the regional legislatures. In the northern and western regions, the legislatures would be bicameral, with an upper house of chiefs, as well as a house of assembly. Regional business was placed under the direction of a regional executive composed of a lieutenant governor, not more than five officials and from six to nine ministers, appointed from the members of legislatures with the approval of the members of the house concerned.

The regions were permitted to legislate on specified subjects, including agriculture, education, health and local government, subject to the approval of the central council of ministers. The central legislature consisted of 136 representatives, 68 elected from among members of the northern legislature, and 34 each from the western and eastern legislatures, together with 6 ex-officio members and 6 special members. The central council of ministers, "the principal instrument of policy in and for Nigeria," consisted of the governor as president, 6 officials and 12 ministers appointed from the members of the central legislature (4 from each region) with the approval of the regional legislatures. Responsibility for government was vested in the council as a whole, individual ministers being responsible for submitting to the council questions within their spheres, conducting business relating to such matters in the central legislature and ensuring, in association with the public officer concerned, that the decisions of the council were carried out.

The franchise, on which election to the regional legislatures took place between August and December, had been extended in April. Voters had to be 21 years of age or over; either resident for 12 months in, or natives of, the division concerned; and to have paid, or been exempted from, tax. Women were not eligible to vote in the northern region nor in practice in the eastern, since they were not liable to tax there. The primary elections were for a series of electoral colleges, and in the northern and the western regions, but not in the eastern, additional members were nominated directly to these electoral colleges by the native authorities.

In Lagos, five members were directly elected by secret balloting.

The two principal parties were Nnamdi Azikiwe's National council and Awolowo's Action groups for which support mainly came from the Yoruba tribes. In the western region the Action group won 45 of the 80 seats. The National council secured all 5 of the Lagos seats and 12 of the 80 in the eastern region, while a further 13 in that region were at the end of the year "doubtful."

Sierra Leone.—The new constitution, delayed by opposition to increased protectorate representation, was introduced in 1951 after a petition from the National Council of Sierra Leone asking that the territory be divided into two separate political units had been rejected. Elections took place in November and were contested by the two most important political organizations, the Sierra Leone People's party and the National council. The People's party stood for the maintenance of the unity of the colony and protectorate but demanded a more democratic constitution; its other objectives included government control of the produce marketing boards, greater Africanization and reduction in the cost of living. The National council did not contest seats for the protectorate, since it stood for separation. This was the first time that women took part in elections for the legislative council.

The People's party won all 14 protectorate seats and 2 of the colony seats.

Finance and Trade.—Currency: (West African) pound (£1 = £1 sterling = 280 cents U.S.).

	Revenue 1950	Expenditure 1950	Imports 1950	Exports 1950
Gambia	£ 999,216	£ 1,062,311	£ 2,752,000	£ 1,743,000
Gold Coast	20,564,750	15,643,150	44,276,174	71,435,395
Nigeria	30,800,000	28,200,000	60,500,000	85,500,000
Sierra Leone	2,920,729	3,205,299	6,745,865	6,959,130

The principal exports were: Gambia, peanuts; Gold Coast, cocoa, gold, manganese, timber; Nigeria, cocoa, tin, peanuts, palm oil and kernels; Sierra Leone, palm kernels, diamonds, iron ore.

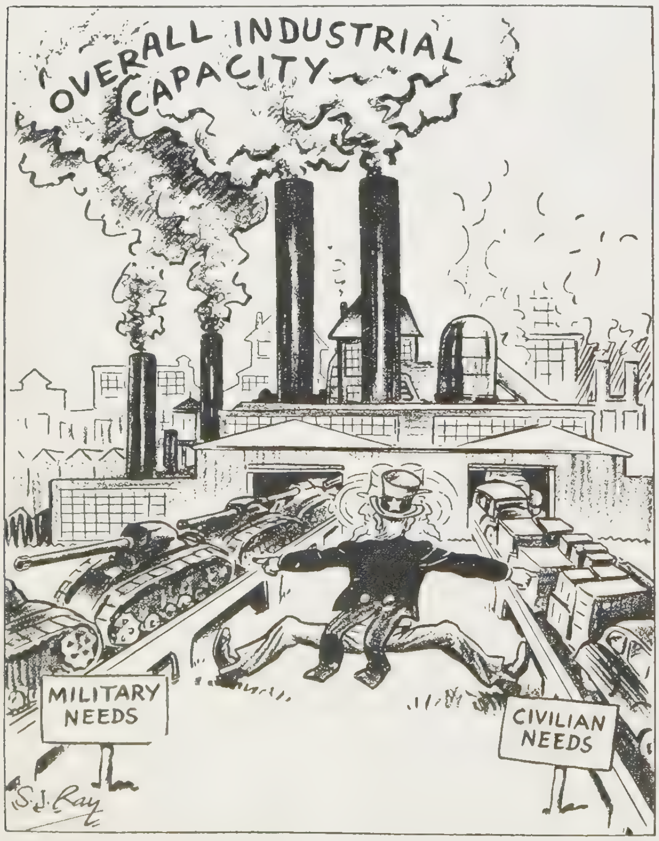
Budget, National. **United States.**—The U.S. budget submitted to the congress by Pres. Harry S. Truman on Jan. 21, 1952, recommended expenditures of $85,444,000,000 for the fiscal year ending June 30, 1953. This total represented an increase of about $14,500,000,000 over fiscal 1952 and of about $45,300,000,000 over fiscal 1950, the last full year before the outbreak of the Korean conflict. On the basis of existing tax laws, it was expected that revenues in fiscal 1953 would total $70,998,000,000, as compared with an estimated $62,680,000,000 in fiscal 1952.

Expenditures and revenues for the fiscal year 1953 as presented in the budget would result in a deficit of $14,446,000,000. For fiscal 1952 there would be an estimated deficit of $8,201,000,000.

The president noted that ". . . partly as a result of inadequate revenue legislation last year, we were now confronted with the impracticability of financing government expenditures currently out of taxes for the next year or so." However, he suggested that, "at the very least," additional revenue be raised to the amount (about $5,000,000,000) by which legislation in 1951 fell short of his recommendations.

The 1953 budget, the president stressed, was dominated by "major national security programs"—military services, international security and foreign relations, the development of atomic energy, the promotion of defense production and economic stabilization, civil defense and merchant marine activities. The expenditures earmarked for such programs formed 76% of the total budget. It was also noted by the president that outlays for the major national security programs—at $65,100,000,000 in fiscal 1953 as compared with $17,800,000,000 in fiscal 1950—accounted for all of the increase in total budget expenditures since the attack on Korea. Expenditures for all other programs were placed at $20,300,000,000 for fiscal 1953, about $2,000,000,000 less than in fiscal 1950 and $900,000,000 below the estimate for fiscal 1952.



"TESTING THE OLD BOY'S GENIUS," a 1951 cartoon by Ray of the *Kansas City Star* (Mo.)

Military Services.—The bulk of the projected increase in the 1953 budget was for the purpose of strengthening and expanding the armed forces. Comprising 60% of the over-all budget total, an outlay for military services of more than $51,000,000,000 was recommended for fiscal 1953, as compared with $39,800,000,000 for fiscal 1952, $20,500,000,000 for fiscal 1951, and $12,300,000,000 for fiscal 1950.

International Security and Foreign Relations.—The other increase of large magnitude in the 1953 budget was for foreign policy and international programs, consisting mainly of military and economic and technical assistance to friendly nations in Europe, the middle east and Asia. Total expenditures in this category were projected at $10,800,000,000, substantially above estimated outlays of $7,200,000,000 in fiscal 1952. The increase was attributed by the president to "a sharp acceleration in deliveries of military equipment to our allies overseas."

Finance, Commerce and Industry.—For programs embraced under the heading of finance, commerce and industry, expenditures of $833,000,000 were recommended for fiscal 1953. The increase over outlays of $751,000,000 in 1952 and $176,000,000 in 1951 stemmed entirely from the expansion of programs promoting defense production and economic stabilization. These provided for various forms of financial aid to defense industries, allocation of scarce materials and controls over prices, wages, rents and credit.

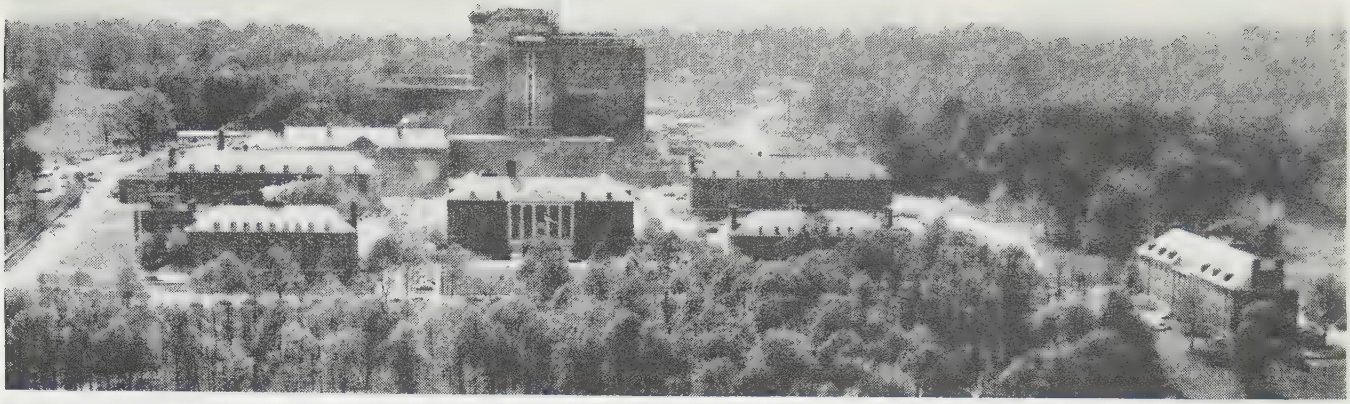
In his budget message the president called for the extension of the Defense Production act beyond its expiration date of June 30, 1952, and urged that the act be strengthened with respect to its price control features. Of the $1,171,000,000 of new obligational authority recommended under this category for 1953, all but $40,000,000 was accounted for by the proposed extension of the Defense Production act.

Transportation and Communication.—Expenditures for transportation and communication were estimated at $1,643,000,000 for fiscal 1953, about $500,000,000 less than in the preceding year. The decline assumed a reduction of $370,000,000 in the postal deficit. Of this amount, $225,000,000 reflected a recommended upward revision in postal rates.

Natural Resources.—The government's programs to conserve and develop natural resources were estimated to require expenditures of $3,237,000,000 in fiscal 1953, as compared with $3,082,000,000 in fiscal 1952. Outlays for atomic energy comprised more than one-half of these totals.

Agriculture and Agricultural Resources.—Expenditures for operating government programs relating to agriculture and agricultural resources were estimated at $1,478,000,000 for fiscal 1953. This compared with $1,408,000,000 for 1952, $650,000,000 for 1951 and $2,783,000,000 for 1950. For the most part, the sharp fluctuation in expenditures was accounted for by the agricultural price support program. In 1951, for example, the Commodity Credit corporation had net receipts of $781,000,000 from the sale of its accumulated holdings of agricultural commodities. For 1952 and 1953, on the other hand, its operations were expected to result in net crop acquisitions (and expenditures) amounting to $70,000,000 and $240,000,000, respectively. Apart from price support outlays, agricultural expenditures in 1953 were scheduled to decline because of lower payments under the agricultural conservation program and of reduced requirements, with the shortage of critical materials, for financing rural electrification.

Labour.—For the fiscal year 1953, expenditures required for administering labour programs were placed at $246,000,000—$6,000,000 more than in the previous year. Three-fourths of the total consisted of direct grants to the states for the administration of the employment services and the unemployment



MEDICAL RESEARCH and hospital centre built at Bethesda, Md., in 1951, at a cost of $40,000,000, housing the national institutes of health, including those for cancer, mental health, dentistry, etc.

insurance systems.

Housing and Community Development.—Budget outlays for housing and community development were estimated, on balance, to decline from $881,000,000 in fiscal 1952 to $678,000,000 in fiscal 1953. In line with the government's policy to curtail housing construction so as to help meet the materials requirements of the defense program, it was expected that in 1953 net purchases of mortgages would decline by almost $500,000,000 and that public housing programs would realize substantial net receipts, instead of incurring net expenditures. However, expenditures for defense housing and community facilities and for civil defense activities were scheduled to increase sharply.

Education and General Research.—Under this category it was recommended that expenditures be increased from $238,000,000 to $624,000,000. By far the largest part of the increase was attributable to proposed grants of $290,000,000 to the states for the operation and maintenance of elementary and secondary schools. Other legislation proposed by the president called for $35,000,000 to help provide schools in communities overburdened because of federal activities and $30,000,000 to give financial aid to "capable young people who otherwise would not attend a college or university."

Social Security, Welfare and Health.—Expenditures for social security, welfare and health were estimated at $2,662,000,000, slightly less than in the previous year. Anticipated declines in the transfer of pay roll taxes to the railroad retirement trust account and in federal aid for hospital construction were approximately offset by the proposed expenditure of $100,000,000 to provide additional help to the states, on a matching basis, to raise benefit rates under public assistance programs.

Veterans' Services and Benefits.—The largest decrease among the budgetary programs was projected for services and benefits to veterans. Outlays for 1953 were estimated at $4,200,000,000, or about $1,000,000,000 less than in 1952. The bulk of the drop centred in outlays for the education and training of World War II veterans. This program was scheduled to taper off sharply, as the deadline for initiation of training under it had been July 25, 1951. New legislative proposals by the president included $75,000,000 to cover the first year's cost of a program of readjustment benefits to servicemen discharged since the beginning of the Korean conflict and $100,000,000 to defray the cost of an upward revision in rates of death and disability compensation payments arising from service causes.

General Government.—Expenditures for general government services and activities in fiscal 1953 were included in the budget at $1,484,000,000, about 10% higher than in 1952. Decreases scheduled for several items were more than counterbalanced by the recommended increase of $148,000,000 in the government's contribution to the civil service retirement system and by the additional $24,000,000 requested for the bureau of internal revenue for handling the increased volume of tax collections and expanding its auditing and enforcement operations.

Interest.—Accounting for more than 7% of total budget expenditures, interest payments by the federal government were expected to amount to $6,256,000,000 in fiscal 1953. Of this total, $6,150,000,000 represented interest on the public debt. Because of an increase in the volume of interest-bearing debt and higher interest rates, this latter figure was $300,000,000 more than estimated expenditures in fiscal 1952.

Budget Receipts.—The federal government's two largest sources of revenue—income taxes on individuals and income and excess profits taxes on corporations—were expected under existing law to provide revenues of more than $60,000,000,000 in fiscal year 1953, comprising more than four-fifths of the estimated total of budget receipts. Excises, the other major source

Table I.—*Summary of Budget Receipts and Expenditures, United States Fiscal Years 1951 through 1953*

of federal revenue, amounted to about $9,750,000,000 in the 1953 budget. As already noted, the budgeted expenditures and receipts for fiscal 1953 would result in a deficit of about $14,500,000,000.

(*See* also DEBT, NATIONAL; INCOME AND PRODUCT, U.S.; TAXATION; UNITED STATES.)

Great Britain.—The 1951–52 budget of Great Britain, presented in April 1951, showed total receipts of £4,236,000,000 as compared with £3,978,000,000 in the preceding fiscal year. The estimated expansion in receipts was confined largely to increases in income and profits taxes, reflecting in part the imposition of higher rates.

Total budget expenditures were estimated to rise from £3,258,000,000 in fiscal 1950–51 to £4,197,000,000 in 1951–52. The bulk of the increase was attributable to the provision of larger outlays for defense and for the stockpiling of strategic materials.

A small surplus of ordinary receipts over ordinary expenditures (amounting to £39,000,000) was shown by the budget for fiscal 1951–52. In the preceding year there was a surplus of £720,000,000. (C. F. Sz.)

Building and Construction Industry.

The dollar value of building and construction activity in the United States climbed to new heights in 1951. Despite federal restrictions and threats of material shortages, total expenditures for new construction in the United States amounted to $30,000,000,000 during the year, an increase of 7% over the 1950 total. Rising construction costs, however, absorbed the difference in dollar outlay between the two years so that in physical terms the value of new construction in 1951 was approximately the same as in the previous year.

The construction boom appeared to taper off, however, at mid-year. The second half of 1951, reflecting the impact of the defense program, was marked by a gradual reduction in total construction from the record levels of the previous 18 months. Although there were larger outlays for such defense-connected work as industrial, military and naval projects, declines occurred in new private residential, commercial and other nondefense projects. The shift in the type of construction was also accompanied by a change in the proportion of total activity financed by private and public funds. In 1951 private and public construction constituted 70% and 30% of the total, respectively, contrasted with 75% and 25% in the previous year.

Private investment in new construction in 1951 totalled $20,800,000,000, an amount equal to the 1950 sum. Declines in housebuilding, commercial and recreational construction were almost exactly balanced by increased expenditures for new industrial plants, utility installations, office and warehouse buildings and institutional construction. Publicly financed new construction in 1951 amounted to $9,000,000,000, 27% above the 1950 total. Expenditures on new military facilities increased sixfold

MASS-PRODUCED, low-cost housing development at Hollin Hills in Alexandria, Va., awarded first prize by the Southwest Research institute for its good contemporary lines and excellence of site

between 1950 and 1951, and investment in atomic energy and defense plants was nearly four times as large in 1951 as in 1950.

Construction Costs.—Construction costs continued to increase in the course of 1951, but the rate of increase declined as the year progressed. In the early months the department of commerce composite index was 12% higher than for the first quarter of 1950. For the next four months, however, there was virtually no change in the index, which stood at approximately 237 (1939=100), and by August construction costs were only 5.4% above the comparable month of the previous year. The Boeckh indexes of residential-construction cost and the cost of constructing apartments, hotels and office buildings, each displayed the same general movement revealed by the composite index. In October these indexes were equal to 239.3 and 221.0 respectively, each roughly 6% above the previous year's level.

Materials Prices and Production.—Wholesale prices of building material continued to rise in the early months of the year, reaching a record level of 252.5 (1939=100) in March and April, an increase of 18% in one year. Beginning in May, a turnback in materials prices occurred and the gradual reduction in the ensuing months brought the August materials price index below the level for January, but still 4% higher than Aug. 1950. The main cause of the decline was the drop in lumber and paint materials prices. Prices of structural steel, cement, brick and tile, plumbing and heating equipment and other materials remained largely unchanged after the first quarter.

The production of virtually all major building materials increased appreciably during 1951. The composite index of materials output was 8.3% higher for the first eight months of 1951 than in the January to August period of 1950. Brick, cement and gypsum board output rose 12.8%, 12.1% and 18.3% respectively, while lumber and hardwood flooring each increased 4.3% during this interval. Production of wire, nails and warm-air furnaces each were at fractionally lower levels than the previous year. In general, supplies of building materials were adequate to meet the large volume of new construction during the first half of the year. By midyear, however, builders were encountering increased difficulty in obtaining metallic building products. Copper and copper alloy items were in particular short supply and shortage of heavy structural steel shapes and piling had become evident. As the year progressed, finished products in trade channels began to be used up and materials shortages in some areas began to delay the completion of projects.

Government Regulation.—Shortly after the outbreak of the Korean war, the National Production authority limited the construction of nonessential facilities in an attempt to conserve material and manpower for the defense effort. During the first half of 1951 further limitations and restrictions were invoked, and on Aug. 3 a new basic order was announced which revised the regulation of construction and the use of building materials. Under this order the construction of all types of buildings, structures or projects requiring the use of more than specified quantities of controlled materials could be undertaken (or continued if already begun) only if the private contractor received federal authorization and a related allotment of materials.

A contractor, however, could self-authorize orders for less than the specified amounts of restricted materials. Construction for recreation, entertainment and amusement purposes was expressly forbidden unless the structure required less than two tons of carbon steel, 200 lb. of copper and no aluminum, aluminum alloy steel or stainless steel.

It was expected that the bulk of residential construction would proceed under self-authorization since this procedure was available to builders of one- to four-family houses which do not require more than specified amounts of copper and steel. All multifamily (five or more units) residential construction started or continued after Sept. 30 required specific authorization and the allotment of controlled materials. Application might also be made to secure more than the amounts of controlled materials allowed under the self-authorization procedure for one- to four-family dwellings, but such authorization was strictly limited to cases of unforeseeable hardship.

Credit Regulation and Price Control.—Credit limitations were imposed on nonresidential building for the purpose of adding further restraints on inflation and to conserve critical materials and labour for defense construction. Effective Feb. 15, 1951, the federal reserve board limited maximum loans on new office buildings, warehouses, stores, banks, hotels, theatres, clubs and other new structures used for nonresidential purposes to 50% of sale price. The financing of major additions or improvements (those exceeding 15% of value) was similarly

HEMISPHERIC HOUSES in a project on the outskirts of Milan, It., which included 13 homes in 1951. Each of the 4-room concrete structures cost about $2,000 and had a diameter of 27 ft.

restricted to a maximum of 50% of cost. Necessary civilian facilities, such as schools, public utilities or government buildings, were exempted from credit restraints as were structures devoted to manufacturing, mining or farm use.

The Office of Price Stabilization on Nov. 20 established ceiling prices for construction and related services, on the basis of current costs for labour, materials and equipment, plus 90% of the highest profit markup which the seller used for similar jobs during the pre-Korean war base period of July 1, 1940, to June 24, 1950. Defense agency contracts were exempted from these regulations as were speculative builders who constructed houses for sale or rent, rather than on contract for an owner.

Employment and Earnings.—Building and construction activity in 1951 provided employment for more than 2,500,000 workers on the average per month, an all-time record in the history of the industry. In January, normally a low month of the year because of seasonal factors, employment stood at 2,281,000, considerably higher than the peak months of many previous years. During the ensuing months employment increased steadily, reaching the record number of 2,791,000 workers employed on construction projects of all types during the month of August. Employment dropped slightly in September, but the monthly average for the first eight months of 1951 showed a 14.5% increase over the comparable period of the year previous.

General inflationary pressures coupled with a shortage of trained construction workers, brought about by the unprecedented volume of building, were reflected in higher wage rates, longer work week and increased earnings. The index of union hourly wage rates stood at 189.0 (1939=100) at midyear, an increase of 7% over a twelve-month period. The average hourly earnings of all workers (union and nonunion) employed by construction contractors rose steadily during the year, from $2.09 in January to $2.18 in August. Average weekly earnings rose faster than the hourly rate because of the increased length of the work week. On the average, construction workers earned $7.47 more per week during August than in January and about $10 more than in Aug. 1950, bringing their average weekly earnings to $85.08.

Building labourers . .	6	9	.88	1.66	2.15

Residential Construction.—The number of nonfarm dwelling units put under construction amounted to 1,022,600 units in the first 11 months of the year. The single-family house was by far the preferred type of new dwelling accounting for more than eight out of every ten new units started. The continuing trend toward the further development of small towns, particularly those which comprise the suburbs of large cities, was manifest in the fact that more than 40% of the new dwelling units put under construction were in rural nonfarm areas while somewhat less than 60% were located in urban centres.

More than 40% of the private dwelling units started in the course of the year were undertaken with mortgage guarantee or insurance aids provided by the Federal Housing administration and the Veterans administration. Home loans (on new as well as existing dwellings) guaranteed and insured by these federal agencies constituted more than one-third of the estimated amount of nonfarm mortgage recordings of $20,000 or less.

Co-operative housing in the United States received a small but significant stimulus from mortgage insurance provisions of sec. 213 of the National Housing act, as amended in 1950. During the first 11 months of 1951, applications covering 26,196 new dwelling units were received, and 7,085 new units were insured under this program.

The provision of publicly subsidized permanent low-rent dwelling units took rapid strides during the year. As of Dec. 7, 1951, local housing authorities throughout the nation had 585 projects comprising 100,252 new housing units under construction, of which 68,760 had been started after the first of the year. These dwellings were to be occupied by families whose income was not sufficient to allow them to rent or purchase adequate homes, and by households that had been displaced as a result of urban redevelopment or slum clearance projects.

Since the passage of the Housing act of 1949, applications had been filed by local housing authorities for federal financial assistance in developing 511,000 dwellings. The Public Housing authority allocated 332,000 of these, and co-operation agreements were executed between local housing authorities and local governing bodies in connection with the development of 293,335 dwellings. Site selections were approved for 236,100 units and presidential authorization for annual contribution contracts was received for 195,700 units.

As a defense conservation measure, the president had budgeted only 75,000 low-rent units to be started during 1951 compared with the 135,000 units authorized in the 1949 housing act. In the course of the year, congress further reduced the number of units on which construction could be begun to 50,000 for the year beginning July 1, 1951, and ending June 30, 1952.

Urban Redevelopment.—Planning for slum clearance and urban redevelopment was under way in many cities, and site preparation and reconstruction was begun in some. As of Oct. 31, 1951, 144 local programs were in process, of which 138 were operating under approved applications for federal aid in accordance with the provisions of title I of the Housing act of 1949. Most of the programs were still at the planning stage, but applications for capital grants in the amount of $180,323,000 had been made in anticipation of the write-down in values that would be necessary to put the land to its proper redeveloped use.

Outlook for 1952.—The office of the economic stabilization director recommended a sharp reduction in housing construction for 1952 to somewhere between 450,000 to 500,000 family units as an anti-inflationary device. The Defense Production administration maintained that there were adequate materials for 700,000 dwelling units, while the Housing and Home Finance agency estimated the national need to be in the vicinity of 900,000 dwellings. For the first three months of 1952, however, the Defense Production administration authorized a sufficient amount of steel, copper and aluminum to permit a home construction rate of 850,000 per year. (*See* also Architecture; Business Review; Ceramic Products; Housing.)

(Ch. Ra.)

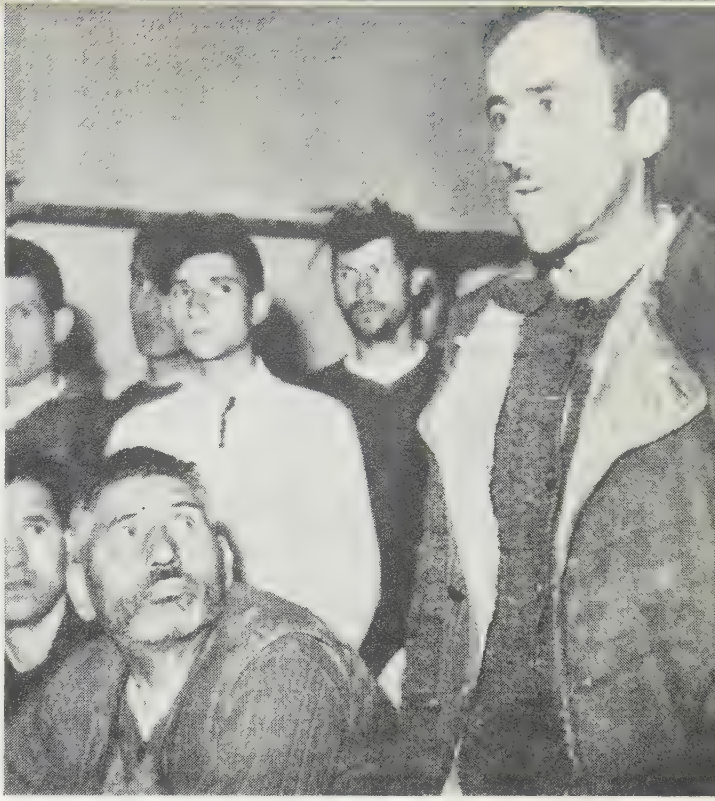
Great Britain.—Against a background of increased wage rates and materials costs, the British building industry sought during 1951 to adjust itself to the changes brought about by rearmament. Normal civil building was replaced by building for defense purposes to the extent of about 10% and it was forecast that this proportion would be considerably increased during the 3-year defense program. Work was seriously hampered by shortage of steel. The housing program remained unaltered at 200,000 houses a year, until the promise to raise the number to 300,000 became one of the principal planks in the Conservative platform at the general election. It was ultimately concluded that the target could be raised only gradually and there were many who felt that increased production of houses could be obtained only at the expense of other building.

Labour relations remained good although there were occasional calls for nationalization from the trades union leaders. Wage increases amounting, in all, to 3*d.* per hour (bringing their rate to 3*s.* 3*d.* per hour in London) were negotiated for skilled craftsmen and incentives payment schemes were extended, so that most workers were able to earn weekly wages substantially greater than the standard rate.

The first international Building Research congress met in London in September. The reluctance of the industry to take advantage of the results of research was stressed at several of the discussions, the evidence from western Europe and from the U.S. differing little from that from Great Britain so far as established methods of small-scale building were concerned. It was notable, however, that in the less complex, larger-scale work, described in Great Britain as civil engineering, as distinct from building, development continued satisfactorily. (D. A. G. R.)

Bulgaria. A people's republic in the eastern part of the Balkan peninsula, Bulgaria is bounded north by Rumania, west by Yugoslavia, south by Greece and east by Turkey and the Black sea. Area (including southern Dobruja): 42,796 sq.mi. Pop.: (1946 census) 7,022,206, (mid-1950 est.) 7,235,000. Languages (1947 est.): Bulgarian 88%, Turkish 9.8%. Religions (1947 est.): Greek Orthodox 84%, Moslem 11.5%. Chief towns (pop., 1947 est.): Sofia (cap., 434,888); Plovdiv (125,440); Varna (77,792); Russe (53,420). Chairman of the praesidium of the national assembly in 1951, Gen. Georgi Damianov; prime minister, Vulko Chervenkov.

History.—In contrast with the more northerly and economically more developed people's democracies, Bulgaria did not revise its five-year plan. It was probable that the existing targets were quite as ambitious as so backward a country could hope to achieve. In so far as scarce raw materials and machinery were allocated for the whole eastern European region by the supreme planners in Moscow, it might be expected that Bulgarian industrial projects had the lowest priority of all. The argument so much emphasized by Yugoslav propaganda, that Bulgaria was being treated as an agrarian colony of the soviet imperialists, had some basis in fact. Bulgarian spokesmen, however, continued to stress their state's industrial progress. Premier Chervenkov, in a speech in Sept. 1951, on the eve of the seventh anniversary of "liberation," boasted that Bulgaria produced all forms of agricultural machinery except tractors and combines, and such electrical equipment as motors, automatic telephone exchanges and radios. A nitrogenous fertilizer plant with a yearly capacity of 70,000 tons would soon be in operation. Meanwhile great progress, he claimed, was being made with the electrification of the country. Later in September it was announced that the ministry of industry had been divided into two: a ministry of heavy industry under Anton Yugov and a ministry of light industry under Atanazi Dimitrov.



BULGARIANS who fled to Yugoslavia for safety in 1951. The farmer spokesman at right stated that he feared for his life because of his refusal to terrorize other farmers into meeting compulsory food deliveries

Labour conditions were tightened up at the end of 1950. A law for the protection of state property included severe penalties, and was so phrased as to enable the most sinister interpretation to be placed on acts of negligence. A decree forbade workers to change their jobs, and forbade any factory to employ new workers, unless the workers had official permits from the cadres department of their local authority (people's committee). The wages system was further remodelled on the soviet system of progressive piece rates. By Aug. 1951 it was officially claimed that it was stimulating output considerably.

Bulgaria remained far ahead of the other people's democracies in its progress towards collectivization of agriculture. By June collective farms included more than half the peasant population of the country and nearly half its arable land. In the main grain producing areas—the Dobruja and the plains on the south bank of the Danube—a large majority of all peasant holdings were included in collective farms. The average collective farm included 220 peasant families and possessed 845 ha. of land. The methods by which these results were obtained caused a good deal of administrative confusion and controversy within the Communist party ranks. As early as February a decree introduced the brigade system, by which peasants worked in groups of 40 to 60 under a foreman and were paid according to their output. In April Chervenkov complained of abuses committed in the countryside by party members and of a "distortion of the party line." In June a special political administration, controlled directly by the Communist party, was set up in the ministry of agriculture, and political departments of party members were attached to machine tractor stations and state farms. These departments were copied from the soviet experience of 1933–34. The decree which set them up stated: "The organs of the party and the state can no longer confine themselves to giving instructions and financial and material aid: they must take into their own hands the direction of co-operatives, state farms and machine tractor stations." In June the minister of agriculture, Titko Chernokolev, was dismissed and replaced by Nikola Stoilov. A few months later there were official complaints that the "statute" of the collective farms was being violated. In particular, land had been used for other purposes than those laid down in official directives and members had been given excessive advances on their pay.

The pace of collectivization in Bulgaria was comparable to that in the Soviet Union in 1929–33. The fact that it was far more difficult for independent observers to visit the Bulgarian countryside than it had been then to visit the soviet countryside made it impossible to compare the results. There were some indications of slaughter of animals by peasants and some reports of minor armed clashes between peasants and police. Bulgarian peasants from the western provinces fled to Yugoslavia and told of an atmosphere of terror in the Bulgarian villages. There was plenty of evidence from official Bulgarian sources that the harvest was going badly, and it was a reasonable interpretation that this was at least partly because peasants refused in some areas to cultivate crops from which they knew that they would gain nothing. The reasons for the dismissal of Chernokolev and the reorganization of the ministry were not clear. But it seemed likely that the minister had been considered by Chervenkov and his soviet masters too indulgent to the peasants. In general since 1947 the trend of government policy had been to increase the pressure on the peasants.

By a ministerial reshuffle of Dec. 29, 1950, Ivan Mihailov became a deputy premier, and Georgi Veselinov was appointed minister of the interior in place of Russi Hristozov, who became minister of food and supplies. In June 1951 the minister of local economy and public works, Peter Kamenov, was relieved of his duties. The next month there was published a report by the State Control commission on its survey of government departments and nationalized enterprises. It found that administrative personnel was much in excess of the numbers laid down by law, that public funds were extravagantly spent and that the ministry of finance was not exercising effective control over other departments' expenditure.

The hate campaign against Yugoslavia continued throughout the year and there were a number of spy trials. (*See* also YUGOSLAVIA.)

Education.—Schools (1949–50): kindergarten, including part-time schools 1,403, pupils 57,487, teachers 2,124; primary 6,112, pupils 755,628, teachers 18,801; elementary 2,960, pupils 308,160, teachers 12,636; secondary 218, pupils 112,633, teachers 4,624; technical 101, pupils 26,800, teachers 943. Universities and institutions of higher education (1947–48) 9, students 49,800, professors and lecturers 1,283. Illiteracy (1946) 23%.

Finance and Banking.—Budget (1950 est.) balanced at 211,866,000,000 leva; (1951 est.) revenue 271,794,000,000 leva, expenditure 267,922,000,000 leva. National debt (March 31, 1947) 68,896,000,000 leva. Monetary unit: lev (pl. leva) with an exchange rate (Nov. 1951) of 290 leva to the U.S. dollar.

Foreign Trade.—(1948) Imports 35,119,000,000 leva, exports 34,114,000,000 leva. Main sources of imports (1949): U.S.S.R. 64%; other eastern European countries 26%. Main destinations of exports: U.S.S.R. 48%; other eastern European countries 34%. Main imports: metals, machinery and textiles. Main exports: tobacco, wines and spirits.

Transport and Communications.—Roads (1945): 13,870 mi. Licensed motor vehicles (Dec. 1950): cars 6,000; commercial 5,000. Railways (1949): 1,996 mi. Telephones (1948): 54,347. Radio receiving sets (1949): 205,000.

Agriculture.—Main crops (metric tons, 1948): wheat 1,503,000; rye (1947) 95,000; barley 249,000; oats 105,000; maize 890,000; sugar, raw value (1950) 46,000; tobacco 20,000. Livestock: cattle (1950) 2,140,000; horses and mules (1948) 449,000; sheep and goats (1948) 8,995,000; pigs (1950) 1,500,000; poultry (1947) 10,329,000. Wool production, greasy basis (1950) 12,700 metric tons. Wine production (1949): 426,000 hl.

Industry.—Fuel and power: coal and lignite (1948) 3,933,000 metric tons; electricity (1949) 551,000,000 kw.hr. Index of industrial production (on basis of 1938 = 100) 1949: 227; 1950: 280. (H. S-W.)

Burma. An independent federal republic, Burma lies on the eastern side of the Bay of Bengal, between Pakistan and India on the northwest, Tibet on the north and China, Indochina and Thailand (Siam) on the east. The republic comprises Burma proper, the Shan state, the Kachin state, the Chin special division and, when it is constituted, the Karen state. Area: 261,749 sq.mi. Pop.: (1941 census) 16,823,798; (1950 est.) 18,489,000. Racially, the peoples of Burma are Mongoloid. About 90% are Buddhist by religion, and about 70% use the Burmese language. Largest indigenous minorities (1931): Karens 1,367,673, of whom 218,790 were Christians; Shans 1,057,406; Chin-Kachin group *c.* 750,000. Largest immigrant minorities: Indians (1931) 1,017,825, divided equally between Moslems and Hindus; Chinese (1941) *c.* 380,000. Chief towns: Rangoon, capital and main port (pop. 1941, 501,291); Mandalay (pop. 1941, 163,537); Moulmein (pop. 1931, 65,506); Bassein (pop. 1941, *c.* 50,000); and Akyab (pop. 1931, 38,094). President of the republic in 1951, Sao Shwe Thaik; prime minister, Thakin Nu.

History.—The country continued throughout 1951 to be troubled by the operations of various types of rebels, notably the Burma Communist party, the Communist party (Burma) and the Karen National Defense organization, all of whom maintained their resistance against the forces of law and order. The year was a disappointing one for the government with regard to military operations, for no real success was gained. The government forces held the principal towns and, more precariously, the principal lines of communication; but none of these was completely secure; thus the Rangoon-Mandalay railway line, though at times open to traffic, was frequently disrupted by sabotage. Away from the towns and principal communications, moreover, the government's hold on the country was tenuous in the extreme, and over wide areas law and order did not exist. In general, there was a distinct tendency for the Communist rebels to move northward and northeast, and in the view of some observers their intention was to consolidate themselves in an extensive area on the Chinese frontier where they would be more accessible to any aid that might be forthcoming from Communist China. There was also a tendency toward increasing co-operation between the different rebel factions, and both the Burma Communist party and the Karens seemed to have reached a stage where they had come to dislike the government more than they disliked one another. Some hope of reconciling the Karens to the lawful regime was aroused by the government's proposal to set up a Karen state, comprising the Salween district and so much of adjacent areas as were predominantly Karen in population, with a wide measure of local self-government similar to the local autonomy enjoyed by the Shan and Kachin states; but at the end of the year it was not apparent that this measure was sufficiently far-reaching to satisfy the Karens.

A further element of disorder was the presence in the Shan state of Kengtung, in the east of Burma, of a force of Chinese nationalist troops. These, consisting mainly of Kuomintang forces which had fled into Burma early in 1950 before the advance of the Chinese Communists into Yunnan, had held out in

Kengtung despite all efforts of the Burmese government to dislodge or capture them; and in July 1951 they attempted an invasion of Yunnan. This incursion was repelled and the Kuomintang force thereafter maintained itself in the Shan states, living on the countryside and presenting a possible cause of discord between Burma and China.

Disorder necessarily affected the country's finances; and the budget for 1951–52, introduced on Aug. 30, provided for expenditure of Rs. 919,300,000 and revenue of Rs. 745,500,000, so giving a deficit of Rs. 173,800,000. The deficit was the result of heavy expenditure on defense forces and police.

Despite the widespread disorders, the first general elections since Burma attained independence in 1948 were held during the year. The elections took place in three stages, the first in June in 67 constituencies in the least-disturbed parts of the country, the second in 36 constituencies in August and the remainder in about 90 constituencies in November. Unfortunately, the charges of malpractice brought by defeated candidates were so numerous that the final results were still unknown at the end of the year, but it was evident that the Anti-Fascist People's Freedom league (A.F.P.F.L.)—the main support of the government—was, in general, successful. According to the press, in 43 constituencies in the first electoral group, the league won 26 seats. The principal opposition party, the Burma Workers' and Peasants' party, which had broken off from the Socialist party—the chief component of the A.F.P.F.L.—in Dec. 1950, was avowedly Marxist in attitude, sympathetic to the Soviet Union and seeking to align Burma with the Communist states as against the democracies, but it professed a policy of constitutional opposition. It made little appeal to the electorate, however, and gained only three seats in the first series of elections. Attempts were made to form a united opposition under the leadership of Ba Maw, the wartime dictator of Burma during the Japanese occupation, but these efforts came to little.

Rice production was well maintained during the year, and exports totalled more than 1,300,000 tons, as compared with 1,800,000 tons in 1950; but even so the total compared poorly with the prewar average export of more than 3,000,000 tons. In other fields of economic activity, measures to facilitate production took the form of proposals for joint ownership between the Burmese government and the European concerns dominating the petroleum and mining industries. An agreement was reached with the Burma Oil company whereby the government, aided by a loan of £2,500,000 from the British treasury, was to become owner of one-third of the stock of the concern, and a similar plan was in hand for joint ownership of the Burma corporation's silver and lead mining concern at Bawdwin-Namtu in the Shan state.

Burma also benefited from aid from the Economic Cooperation administration. Under an E.C.A. agreement, the United States made available a sum of $1,500,000 to reconstruct and modernize the ports of Akyab, Bassein, Moulmein, Mergui and Tavoy, and a further $1,000,000 was provided for the improvement of the port of Rangoon. (B. R. P.)

Education.—Schools (1948): primary 4,795, pupils 431,684, teachers 11,315; postprimary 142, pupils 11,648, teachers 722. Teachers' training college 1, with more than 200 trainees. Universities (1950) 2, students 3,350 (including 780 women).

Finance and Banking.—Budget (1951–52 est.): ordinary revenue Rs. 583,772,000, ordinary expenditure Rs. 542,457,000; capital revenue Rs. 161,801,000, capital expenditure Rs. 376,789,000. Monetary unit: rupee, with an exchange rate (1951) of Rs. 4.762 to the U.S. dollar.

Foreign Trade.—Imports (1950) Rs. 432,000,000; exports Rs. 661,000,000. Main sources of imports (Jan.-June 1950): India 39.6%; U.K. 31.4%; China 4.1%; Iran 4.1%. Main destinations of exports: Ceylon 30.5%; Japan 17.3%; India 11%; Indonesia 10.5%. Main imports (1948–49): textiles 36%; food products 13%; machinery appliances and vehicles 11%. Main exports: rice 82%, metals and ores 3%.

Transport and Communications.—Roads (1949) 12,472 mi. Licensed motor vehicles (Dec. 1950): cars 5,100; commercial 24,000. Railways (1950): 1,777 mi.; passenger-miles 80,000,000; net freight ton-miles 93,000,000.

Agriculture.—Main crops (metric tons, 1950–51); rice 4,080,000; peanuts 147,000; cottonseed 11,000; sesame seed 40,100; cotton, ginned, 6,000; dry beans 50,000. Livestock (Jan. 1950): cattle 4,488,000; sheep 21,000; goats 172,000; pigs 402,000; buffaloes 721,000. Fisheries: total catch estimated at 500,000 tons annually.

Industry.—Factories (1947) 473; persons employed 46,480. Raw materials (1950): tin concentrates 1,709,000 metric tons; natural rubber 15,800 metric tons; lead (1948) 7,600 metric tons; silver (1948) 480,000 fine oz.; timber, teak (1948–49 rafting season), 68,938 logs.

Business Review. Mobilization of the economy for national defense was the fundamental force behind most major changes in the economy during 1951 in the United States, as it had been from mid-1950 with the outbreak of war in Korea. During the greater part of the year 1951, the economic situation was characterized by high levels of activity in all sectors of the economy and a substantial degree of stability, in contrast with the intensity of the inflation which gripped the nation during the last half of 1950 and the early months of 1951, and in spite of the many internal shifts in the economy incident to expanding and speeding up the defense program.

During the second and third quarters of the year a reasonably orderly adaptation of the economy to the conditions of partial mobilization occurred, and the inflationary pressures, still inherent in the situation, became less pronounced as the control measures enacted in late 1950 and early 1951 became effective, and as the intensity of private consumer demand subsided after the two buying sprees touched off by the international situation.

Efforts to stabilize the economy and to channel the use of resources into the defense effort were reflected in the series of conservation orders issued by the National Production authority: the credit restrictions imposed on the purchase of consumers' durable goods and housing; the higher income tax rates on individuals and corporations; and the monetary actions of the federal reserve board aimed at reducing or controlling the volume of bank credit. In general, these measures were aimed at controlling the inflationary pressures that had already developed and would be intensified as the government spending program got under way, through control of the supply of money and credit, and through limitations and restrictions on consumer spending.

The Revenue Act of 1950, passed in Sept. 1950, increased tax rates applicable to both individual and corporate incomes in 1950 and made further increases applicable to 1951 earnings in both cases. An excess profits tax partially applicable to 1950 income and fully effective in 1951 together with an additional increase of two percentage points in the regular corporate income tax rate for 1951 were subsequently enacted.

In spite of the control measures adopted in the last half of 1950, expanding consumer demand continued to characterize the economy during the first months of 1951. The increase in private investment and consumption coincident with the prospect of expanding government expenditures for defense resulted in a broad extension of the price rise which had been under way since mid-1950, necessitating the imposition of industry-wide government price and wage controls to halt the upward spiral—the price-wage freeze order of Jan. 26, 1951, and further efforts toward credit and monetary controls.

The president, in February, called upon fiscal and monetary authorities to devise means of obtaining adequate bank-credit control without impairing the prospect of successful government debt financing. Possible courses of action included voluntary restrictions on credit by banks and other lending agencies, increases in reserve requirements of banks and direct curbs on credit in areas not yet subject to such control. As a step in

the direction of restricting the tendency of nonbank holders of United States securities to sell to the banking system, the treasury announced on March 3 that a new issue of nonmarketable long-term bonds yielding 2¾% would be offered later in March in exchange to present holders of marketable 2½% long-term bonds.

The general freeze order of January was followed by more flexible types of control in the latter part of February. The main features of the modifications made were: (1) wage-rate increases were permitted up to 10% from Jan. 1950 for those workers who had not received such an advance; (2) adjustments were allowed under cost-of-living escalator clauses in labour-management contracts; (3) fringe benefits were also permitted in addition to the 10% adjustment formula, if they were in the contract before the freeze date; (4) a margin type of price control for most types of nonfood retail goods replaced freeze prices.

Further flexibility in price controls was authorized before the middle of the year, the most important of which was the manufacturers' general ceiling price regulation (CPR-22) issued by the Office of Price Stabilization on April 24, effective May 28. This order provided pricing standards for a wide range of industrial products. It allowed manufacturers to add increases in factory pay roll and materials costs to the pre-Korean price in optional base periods—April 1 through June 24, 1950, or any one of the three preceding calendar quarters.

The enactment of the Defense Production bill extended the major economic controls to the middle of 1952, with modifications mainly in the direction of liberalizing price and credit control provisions.

National Product and Income.—The increased tempo in all phases of the national economy in 1951 was registered in the increase in the gross national product which rose from an annual rate of $318,500,000,000 during the first quarter to $325,600,000,000 the second quarter and to $328,000,000,000 the third quarter, as estimated by the United States department of commerce.

The national income (the sum of earnings of labour and property arising from producing the nation's output) rose from an annual rate close to $270,000,000,000 the first quarter to close to $280,000,000,000 in the third quarter.

The gross national product and the national income reached new high levels in 1951. (*See* also INCOME AND PRODUCT, U.S.)

Prices.—The inflationary rise in both wholesale and retail prices which had been in progress since mid-1950 was halted by the end of the first quarter of 1951, but not before prices had reached new high postwar levels. In Jan. 1951 the all-items consumers' price index of the department of labour rose to 181.5% of the 1935–39 average, an increase of about 8% from Jan. 1950, and of 6% from June 1950. Retail prices continued to rise during February and March although the momentum of the advance was greatly diminished following the general freeze of prices and wages on Jan. 26. The all-items index in March had advanced only 1.6% above January.

The increase in wholesale prices from June 1950 to the freeze date had mounted to 14% with all major price areas contributing to the advance. Following the Jan. 26 freeze action, wholesale prices continued to advance moderately through March, when they were about 2% above the January level. After the first quarter of the year, there was relative stability in both

Below: FORMER MOTION-PICTURE THEATRE in Detroit, Mich., one of a growing number of motion-picture houses being closed down in 1951. The slump in box office receipts was variously ascribed to TV, poor films and inflation

Above: BUYING RUSH at a New York city department store during the price war which followed a supreme court ruling of May 21, 1951. The ruling freed retailers from abiding by "fair trade" resale prices set by manufacturers. Competitive mark-downs ranged up to 35%

Below: CATERERS trundling coffee urns to a New York city office building, a service that became increasingly popular with office workers during 1951

Below: G.I. UNDERWEAR being produced at an infants' wear factory in Boston, Mass., under a $1,000,000 army contract

wholesale and retail prices, with wholesale prices maintaining a continuous downward trend through September, and retail prices, a slightly upward trend. The general level of both wholesale and retail prices throughout 1951 was substantially above the previous postwar high level reached in 1948. Retail prices in Sept. 1951 were 8.5% above monthly average retail prices in 1948, and wholesale prices were about 7.5% above the monthly average for 1948. (*See* also PRICES.)

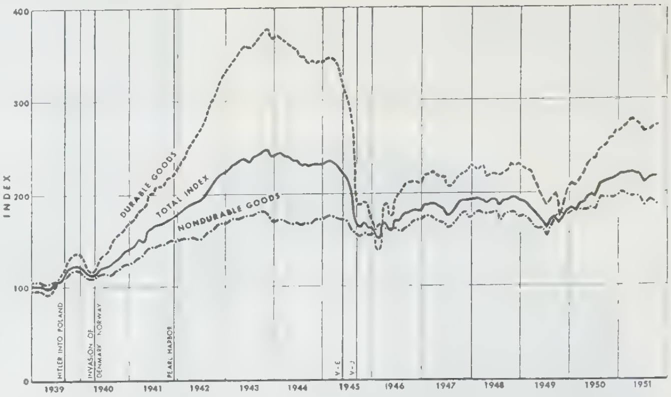
Employment and Wages.—Employment at the beginning of 1951 was near record levels. After dropping slightly in February from January both agricultural and nonagricultural employment increased steadily through October with only minor interruptions. According to estimates of the department of commerce, employment in Jan. 1951 was slightly more than 59,000,000 and unemployment was only 4.1% of the total civilian labour force, lower than the monthly average for any of the previous three years. Nonagricultural employment was estimated at 54,168,000 in October, a gain of almost 1,000,000 workers from Oct. 1950, and of 1,175,000 from Jan. 1951. Agricultural employment in October at 7,668,000 was 823,000 below Oct. 1950, but was up by 1,650,000 workers from Jan. 1951. Thus, total employment in October at 61,836,000 workers was up 2,826,000 from January and unemployment had dropped to 1,616,000 or only 2.5% of the total civilian labour force, the lowest for any period since 1944.

Average hourly earnings in manufacturing rose gradually through September when the average for all manufacturing was $1.61 per hour as compared with $1.55 in January. Retail price increases offset most of this gain, and in terms of 1950 dollars there was substantially no increase in average hourly rates. Average hours worked per week dropped slightly after the first quarter for all manufacturing workers, being slightly more than 41 hr. in the durable goods industries and slightly more than 39 hr. in the nondurable goods industries. (*See* also EMPLOYMENT; WAGES AND HOURS.)

Consumer Credit.—The expansion in consumer credit which had been rapidly increasing since the end of World War II was halted early in 1951 by the controls imposed by the government in late 1950, and the trend was slightly downward through July with slight increases from the July level occurring in August and September. However, although the rapid expansion was curbed, the volume of consumer credit remained high. For each of the first eight months of the year the amount of consumer credit outstanding was only slightly below the high point reached in Dec. 1950, and for each of the first six months of the year was substantially greater than in the corresponding month of 1950. Total credit outstanding in Dec. 1950 amounted to $20,097,000,000 according to reports of the board of governors of the federal reserve system. At the low point in July 1951, the amount outstanding was $19,132,000,000.

Instalment credit, which constituted slightly more than 60% of total consumer credit outstanding during the year, dropped from $13,252,000,000 in Jan. 1951 to $12,903,000,000 in July. By September, instalment credit had risen to $13,156,000,000 which was only $300,000,000 below the high point of Dec. 1950. (*See* also CONSUMER CREDIT.)

Bank Credit.—The expansion in U.S. commercial bank credit which began in May 1950 continued through Sept. 1951 although at a less rapid rate during 1951 than during the fourth quarter of 1950. In Jan. 1951, commercial bank loans stood at $52,700,000,000 and by March had increased to $54,400,000,000 an increase of $1,700,000,000 in the three-month period, according to reports of the board of governors of the federal reserve system. There was little change in the amount of loans outstanding during the four-month period from April through July, but there were increases in August and September, and the September total reached $56,000,000,000, a gain of $1,600,000,000 from March. Thus, during the first three quarters of the year commercial bank credit outstanding increased by $3,300,000,000.



INDUSTRIAL PRODUCTION of U.S. durable and nondurable goods, 1939–51, adjusted for seasonal variation (1935–39=100) (Source: Board of Governors of the Federal Reserve System)

Business loans (commercial, industrial and agricultural loans) of weekly reporting member banks increased by $2,000,000,000 from January to September when they stood at $20,100,000,000. There was a further increase of $500,000,000 in October. The October total of $20,600,000,000 was $4,300,000,000 greater than in Oct. 1950. (*See* also BANKING.)

Personal Income, Spending and Saving.—Total personal income in Jan. 1951 was at the annual rate of $243,600,000,000 and by September had risen to an annual rate of $253,300,000,000, according to reports of the department of commerce. Disposable personal income, that is, income after taxes, rose from an annual rate of $217,500,000,000 in the first quarter to an annual rate of $225,700,000,000 in the third quarter.

Personal consumption expenditures during the first quarter of the year at an annual rate of $208,200,000,000 were higher than for any quarter in 1950, reflecting the second wave of consumer spending touched off by the entrance of the Chinese Communists into the Korean war and the anticipation of rising prices for consumers' goods as well as scarcities in supply as the defense production program progressed. Disposable personal income increased during the second and third quarters as employment expanded and wages increased, but consumption expenditures dropped significantly during the second quarter and rose only slightly during the third quarter.

During the second and third quarters of the year, personal net savings were at an annual rate of slightly more than $21,000,000,000 or almost 10% of the disposable personal income. This was in contrast with net personal savings at an annual rate of only $9,300,000,000 during the first quarter, or only 4.3% of disposable personal income. The total annual personal savings for the year 1951 were estimated to be around $18,000,000,000. the highest at any time since 1945 when savings were forced by lack of things to buy. This amount of savings occurred without any actual dollar reduction in consumption expenditures which, during each of the first three quarters of the year, were at a higher annual rate than in the corresponding quarter of 1950.

Production.—Over-all stability at a high level characterized industrial production during 1951, following the rapid expansion in the last half of 1950. Divergent production trends emerged during the year, however, among the various broad groups of manufacturing. The production of consumer durable goods declined after the first month of the year because of materials shortages and a reduction in demand as instalment credit controls became effective and prices became more stable. The production of producers' durable equipment rose steadily with only a minor setback in the May and July period primarily the result of the materials situation. The federal reserve board's index of total industrial production rose to 220% of the 1935–39 average in October from the July low point of 212% to reach substantially the level of January. The index of manufacturers' durable goods declined during the second quarter of the year after having risen sharply during the first four months of the year, and in July dropped to 266% of the 1935–39 average, the low point for the year and slightly below the January level. During the three-month period August–October, the durable goods index rose sharply and in October stood at 277% of the 1935–39 average, a gain of 11 percentage points from the July low and of 9 percentage points from the January level.

Nondurable manufactures declined steadily from February through July, with a sharp upturn in August followed by declines in September and October. The index of nondurable manufactures in October stood at 190% of the 1935–39 average, only 3 percentage points above the July low, and 11 percentage points below the January level.

The increase during the year in the production of producers' durable goods reflected the effects of the expansion in private business outlays for new plant and equipment and the rearmament program of the government. The decline in the production of consumer durable goods followed the slackening of consumer buying which appeared during the first quarter of the year, at a time when the production of consumers' durables was still close to peak rates. This brought a rather rapid build-up in retail stocks, leading to a sharp contraction in orders placed by retailers and to a subsequent decline in production. The reduction in output in April and May as compared with the previous quarter affected all consumer durable products and, according to estimates of the U.S. department of commerce, ranged from 15% for electric ranges to more than 50% for television receivers. Despite the reduction in the output of consumer durable goods, the flow of these goods to consuming markets during the second quarter of the year was higher than in any other year except 1950, and greater than the existing consumer demand as evidenced by the rapid build-up of retail stocks, particularly of most types of household appliances.

Retail inventories, as reported by the U.S. department of commerce, increased by $2,188,000,000 between January and May to $20,643,000,000 in the latter month. There was some decline during the four-month period June–September, but September inventories of retailers at $18,810,000,000 were still slightly higher than in January. Manufacturers' inventories also rose sharply throughout the year through September with no reduction toward the end of the year, as in the case of retail inventories. Manufacturing inventories in September were estimated by the department of commerce at $40,900,000,000, an increase of $6,780,000,000 from January.

Construction.—Expenditures for new construction continued to increase during the first quarter of the year but declined during the second and third quarters. However, for each month in 1951 through September, expenditures for new construction were higher than during the corresponding month of 1950. October expenditures at $2,395,000,000 were down about $58,000,000 from September in spite of an increase of about $29,000,000 in nonfarm residential construction.

Residential nonfarm construction expenditures continued high during the first quarter, and at $1,049,000,000 in January constituted about 57% of total private construction. Expenditures for residential construction dropped sharply during the second quarter and declined further during the third quarter, but increased by $3\frac{1}{2}$% in October from September.

Federal, state and local government construction expenditures increased during the second and third quarters of the year, as did also private construction other than residential, offsetting to some extent the sharp decline in expenditures for residential construction.

New housing starts for each month of 1951 through September, except for the month of January, were substantially below the corresponding month of 1950. The total of 132,500 new starts in June, the highest month in 1951, compared with 144,300 in June 1950; and the estimated September total of 91,000 was 29,600 below the Sept. 1950 total of 120,600. (*See* also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING.)

New Plant and Equipment.—Expenditures by businessmen for new plant and equipment increased markedly during the first three quarters of the year, from an annual rate of $20,660,000,000 during the first quarter to an annual rate of $27,200,000,000 during the third quarter, an increase in the annual rate of $6,540,000,00. Third-quarter expenditures for new plant and equipment were at an all-time high and were 45% above the third quarter of 1950, according to estimates of the U.S. department of commerce. Fourth-quarter expenditures were estimated to be at a slightly lower annual rate—$26,440,000,000, which, however, was an annual rate greater by $3,110,000,000 than during the fourth quarter of 1950.

Expenditures for new plant and equipment in manufacturing constituted 47% of the total expenditures in the first quarter and rose to 53.7% of the total during the third quarter. Expenditures during the third quarter were at an annual rate of $14,610,000,000 as compared with $9,820,000,000 for the first quarter and $12,560,000,000 for the second quarter. Third-quarter expenditures at an annual rate of $14,610,000,000 were 78% above the third quarter of 1950, and 30% above fourth-quarter expenditures in 1950.

Business Profits.—Corporate profits before taxes reached an all-time peak during the first quarter of 1951, according to reports of the U.S. department of commerce, but declined during the second and third quarters. First-quarter corporate profits before taxes amounted to $51,800,000,000. As a result of the new provisions of the 1950 tax bills becoming fully effective in the first quarter, the tax liability was raised to an over-all rate of about 55% of profits before taxes, so that profits after taxes, amounting to $31,100,000,000 in the first quarter, dropped to $20,700,000,000 in the first quarter of 1951 from $27,800,000,000 in the fourth quarter of 1950. Dividend payments in the first quarter amounted to $8,800,000,000, only about 42% of corporate profits after taxes, the remainder, $11,900,000,000, being retained by corporations to finance their large capital expenditure programs and for other working capital and reserve purposes.

Although corporate profits after taxes declined during the second and third quarters of the year, dividend disbursements in each quarter were greater than in the first quarter and undistributed profits were correspondingly lower. Dividend disbursements in each of the first three quarters of 1951 were greater than in the corresponding quarter of 1950. (*See* also INTERNATIONAL TRADE; LAW.) (V. B. B.)

Other Countries.—Business in 1951 was under the influence of the Korean war and of the rearmament started by it, which caused a violent rise in the price of most of the important raw materials. This was well under way at the beginning of 1951 and reached a climax during its first quarter, being evident, for example, in the price of cotton, linseed, tin and wool.

The extremely high prices in the first quarter were almost certainly, in part, the result of panic buying and its ensuing reaction. This reaction was aggravated in June by the suggestion made by J. A. Malik, the U.S.S.R. representative to the United Nations, that negotiations for a Korean armistice should be started. The boom in raw material prices had been caused in part by U.S. buying for the stock pile, and this proved capable of exerting a steadying effect. The panic buying on the raw material markets was imitated by the retail buyers of many countries. Here, too, the excess of goods piled up in the early months of 1951 led to a reaction later on.

There was a natural time lag between the movements of raw material prices and the prices of the corresponding finished articles. In Great Britain, for instance, suits made from the dearest sorts of wools (those of the first quarter of 1951) did not appear in the shops until November. On the whole, therefore, the trend of retail prices was upward throughout the year.

Although rearmament was the most powerful single factor in the business situation, it was superimposed on the long-term trend to recovery from World War II—a trend powerfully supported by aid provided by the United States through the European Recovery program, which, though diminishing, still played a large part in the economies of France and western Germany. The situation was complicated by the danger that, in view of the strain on many national economies, a slump might be induced, if not by an excess of finished supplies, then from a deficiency of raw materials. Business might slow down simply because a lack of raw materials made profitable working impossible. There were, in fact, indications that the shortage of coal was bringing this about in western Germany.

After the United States, western Europe was the most important economic region. In western Germany signs of overstocking appeared early in 1951; the strength of the preceding rush to buy can be gauged from the fact that applications for import licences for coffee totalled 60 times the normal amount. This overbuying resulted in a certain stagnation. Easter trade brought little help and by the middle of the year it became necessary to lower the prices of textiles, leather and other goods. Drastic steps were thought necessary to clear stocks, and at the summer sales some goods were almost given away. These measures did succeed in clearing stocks, though probably in some instances at a loss.

In the capital goods industries business declined. This was true of building as well as of machinery. In some sections, however, demand remained high. Machine-tool makers were booked up for eight months and textile machinery makers for five or six months. The difficulties were caused by the shortage of raw materials, particularly coal.

In Italy, the economic basis was rather similar to that existing in Germany: both countries relied largely on industry and both were dependent on imports of raw materials. The buying rush for consumer goods soon died down in Italy, and the shortage of raw materials confronted industry. The coal crisis, however, was less acute than in Germany, for the reservoirs were full and there was an abundance of hydroelectric power. Industrial output increased and in June 1951 was 14% higher than a year earlier. More iron and steel were produced, and Italy reached fourth place among the shipbuilding nations.

Among producers of raw materials the price curve took a form similar to that assumed in the highly industrialized countries, but for different reasons. Prices in the producer countries rose because the individual producers of raw materials could bid heavily for consumer goods. The inflationary development could be seen very clearly in Malaya. During the first half of 1951 the average price of rubber was about 125% above the figure for the same period in 1950, and similar conditions existed for tin.

The result was a violent currency inflation, the volume of the note issue being nearly doubled.

In Sweden, large exports, at high prices, of timber, a raw material of world-wide importance, turned the terms of trade in favour of Sweden, but this improvement did not suffice to provide the country with all the raw materials it needed.

Conditions in the great raw-material producing countries in South America illustrated the way in which political factors affected business. In Brazil, where the government fostered industrial expansion, cotton markets were firm at the beginning of 1951, reached a peak in March and had declined by about 42% at the end of June. The market in coffee, though its statistical position was healthier than that for cotton, also showed a progressive weakening. But these deflationary tendencies were partially compensated for by industrial developments. In spite of the importance of the rubber-growing industry in Brazil, the consumption of rubber exceeded production, and the iron and steel industry continued to expand.

In Argentina, though the economic basis closely resembled that of Brazil, differences were brought about by a different governmental policy. The major fluctuation in the prices of raw materials followed the same curve in Argentina as elsewhere, but the tight control over the economy, dictated by political principles, had a special effect. For instance, the desire to maintain a high average standard of living brought about a reduction in meat exports. The export trade was hampered and the country's economy weakened.

Among the smaller states of South America, the general long-term trend toward higher industrialization and output combined with stimulus provided by the demand for raw materials. This could be noted in countries such as Chile, Venezuela and Colombia.

In Japan during the first half of 1951 a boom, culminating about March, was started by the placing of armament orders connected with the Korean war; but production costs were high and some important orders for cotton textiles were cancelled on the ground of costs. The silk trade, too, failed to recover its markets in the U.S. and Great Britain. Meanwhile, the long-term trend toward recovery, coupled with industrialization, continued, and there were great increases in the output of pig iron, crude steel and cotton yarn and fabrics.

Toward the end of 1951, signs that a slump might be starting began to dwindle. The general outlook pointed toward rising prices, scarcities and lively business, but there was no reason for expecting that the national experiences would be uniform. (*See* also EUROPEAN UNION; STOCKS AND BONDS.)

Byrd, Harry Flood (1887–), U.S. senator, was born on June 10 at Martinsburg, W.Va., an elder brother of Adm. Richard E. Byrd. Educated at the Shenandoah Valley academy, Winchester, Va., he began his career as a journalist on the *Winchester Star* (owned by his father), also becoming engaged in farming and fruit-growing. He was a member of the Virginia state senate (1915–25), chairman of the Democratic state committee (1922–25) and governor of Virginia (1926–30). On March 4, 1933, he was appointed U.S. senator to fill the unexpired term of Claude A. Swanson, who had been named Pres. Franklin D. Roosevelt's secretary of the navy. Byrd was elected for the full term 1935–41 and re-elected for the terms 1941–47 and 1947–53. From the first days of the New Deal he opposed almost all its proposed legislation except defense and war measures. He became one of the senate's most persistent advocates of economy in government.

Although Pres. Harry S. Truman in 1950 had complained of "too many Byrds" in congress, Byrd revealed on Jan. 9, 1951, that he had received a cordial letter from the president which was interpreted as a move to reconciliate the southern Democrats. Throughout the rest of the year, however, Byrd continued his attacks on the administration's domestic and foreign policy. On June 25 he charged government leaders with "moral and ethical turpitude." On Nov. 1 Byrd urged all southern Democrats to unite in defeating the Truman Fair Deal in 1952.

Cabinet Members.

The following members of President Harry S. Truman's cabinet held office on Jan. 1, 1952.

Post	*Name*	*State*
Secretary of State	Dean G. Acheson	Maryland
Secretary of the Treasury	John W. Snyder	Missouri
Attorney General	J. Howard McGrath	Rhode Island
Postmaster General	Jesse M. Donaldson	Illinois
Secretary of the Interior	Oscar L. Chapman	Colorado
Secretary of Agriculture	Charles F. Brannan	Colorado
Secretary of Commerce	Charles Sawyer	Ohio
Secretary of Labor	Maurice J. Tobin	Massachusetts
Secretary of Defense	Robert A. Lovett	New York

Great Britain.—The following is a list of cabinet members of Great Britain on Jan. 1, 1952.

Post	*Name*
Prime Minister, First Lord of the Treasury and Minister of Defence	Winston Leonard Spencer Churchill
Secretary of State for Foreign Affairs	Robert Anthony Eden
Lord President of the Council	Lord Woolton
Lord Privy Seal	The Marquess of Salisbury
Lord Chancellor	Lord Simonds
Secretary of State for the Home Department and Minister for Welsh Affairs	Sir David Patrick Maxwell Fyfe
Chancellor of the Exchequer	Richard Austen Butler
Secretary of State for Commonwealth Relations	General Lord Ismay
Secretary of State for the Colonies	Oliver Lyttelton
Secretary of State for Scotland	James Gray Stuart
Secretary of State for the Coordination of Transport, Fuel and Power	Lord Leathers
Minister of Health	Harry Frederick Comfort Crookshank
Minister of Labour and National Service	Sir Walter Turner Monckton
Minister of Housing and Local Government	Harold Macmillan
President of the Board of Trade	George Edward Peter Thorneycroft
Paymaster General	Lord Cherwell

California.

Nicknamed the "Golden state" because of its early association with gold production, this most southerly Pacific coast state of the United States achieved statehood on Sept. 9, 1850. California is ranked second nationally in both area and population. Its land area embraces 156,740 sq.mi. and its water area is 1,953 sq.mi. Total population in accordance with the U.S. bureau of the census reports (as of April 1, 1950) was 10,586,223, marking a decade increase of 3,678,836; 80.7% of California's total population is defined as urban. Chief cities with 1950 census figures (and 1940 populations in parentheses) were: Los Angeles 1,970,358 (1,504,277); San Francisco 775,357 (634,536); Oakland 384,575 (302,163); San Diego 334,387 (203,341); Long Beach 250,767 (164,271); Sacramento (the state capital) 137,572 (105,958); Berkeley 113,805 (85,547); Pasadena 104,577 (81,864); Richmond 99,545 (23,642); Glendale 95,702 (82,582); San Jose 95,280 (68,457); Fresno 91,669 (60,685).

History.—There was much political activity during 1951 in booming "favourite son" Gov. Earl Warren as a possible national Republican presidential candidate in 1952. In addition to Warren the state officers remained: lieutenant governor, Goodwin J. Knight; secretary of state, Frank M. Jordan; treasurer, Charles G. Johnson; controller, Thomas H. Kuchel; attorney general, Edmund G. ("Pat") Brown; superintendent of public instruction, Roy E. Simpson.

Defense, inflation and growth were the keynotes of 1951. Federal service calls took much of California's national guard and stimulated plans for recruitment of a state defense and security corps to serve the "home front," while the office of civil defense undertook the planning, co-ordinating and training work to be performed at the state level in line with national plans for civil defense. Inflation necessitated a 5% salary increase for all state employees effective Jan. 1, 1951, and brought forth a $3,000 minimum annual wage for public school teachers. Growth was reflected by completion of the $7,500,000 east wing to the state capitol building (three times as large as the older portion) and by establishment of various committees for state, area and community planning and study.

Education.—Average daily attendance for budgetary purposes for 1949–50 in elementary school districts was calculated at 1,203,342, in high school districts at 420,548 and in junior college districts at 94.377, and state support for public schools was in excess of $220,000,000. Total enrolment in the state board of education's 11 state colleges was 32,112.

Social Insurance and Assistance, Public Welfare and Related Programs.—As of Oct. 1951, average monthly payment to 274,532 needy aged of California was $66.75 (Oct. 1950, 271,867 at an average of $69.57). Aid to the needy blind paid an average of $81.40 to 10,889 persons. Average monthly assistance payments for 136,806 needy children, both in boarding homes and institutions and in families, was $50.21. Total public assistance was $27,317,281, of which 39.2% was derived from federal funds, 44.8% from state funds and 16% from county sources. For Oct. 1950 beneficiaries of the three unemployment-compensation programs administered by the state averaged 71,640 claimants per week, with benefits for the month totalling $7,246,708. Total expenditures for the state department of corrections for 1950–51 were estimated at $11,278,144. Inmates of California's seven correctional institutions for adults (as of Oct. 1951) numbered 11,629. Population of youth authority institutions (as of Nov. 1951) was 2,340, of which 303 were in two schools for girls, 228 in four work camps for boys, 1,120 in four schools for boys and the remainder in other institutions.

Communications.—Automobile and truck registrations to June 30, 1950, totalled 4,124,582. Estimated total expenditures in 1950–51 for reconditioning, resurfacing and construction of California highways was $126,317,209 (1949–50, $101,572,535). Of this amount, approximately $15,828,919 represented federal-aid contributions (1949–50, $15,816,497). In 1949 California had 8,302 mi. of railways, including 747 mi. of electrically operated roads. As of July 1, 1949, California had 463 airports, including 193 commercial, 142 municipal, 39 military and 89 other fields. There were 2,824 mi. of federal airways as of Jan. 1, 1949. At the beginning of 1950 there were 3,600,000 telephone stations within the state.

Banking and Finance.—Total assets of the 116 state-supervised banks (with 213 branch offices) as of June 30, 1951, were $3,936,558,000 (Oct. 4, 1950, $3,880,601,000). Aggregate assets of 116 state-licensed savings

Table I.—*Leading Agricultural Products of California*

Crop	1951	1950	Average, 1940–49
Cotton lint, bales	1,770,000	978,000	584,000
Cottonseed, tons	696,000	402,000	229,000
All hay, tons	5,426,000	6,226,000	5,704,000
Potatoes, bu.	34,605,000	47,040,000	34,039,000
Oranges, boxes	43,400,000	45,110,000	48,196,000
Lemons, boxes	12,900,000	13,400,000	12,993,000

†Value included with other minerals.

and loan associations operating in California (as of Sept. 30, 1951) were $721,959,204.75.

Estimated total state revenues for 1950–51 were $932,757,501 (1949–50, $841,600,157). Total expense estimates for the year were $1,092,711,250 (1949–50, $1,166,762,418). The state's net bonded debt (outstanding Nov. 30, 1950) was $323,376,077.

Agriculture.—Gross cash farm income for 1950 was $2,335,082,000, or 12% higher than in 1949. Livestock and poultry products returns were $837,502,000 (8% higher than in 1949), while crop returns were $1,483,939,000 (1949, $1,296,143,000). Government payments added $13,641,000 to California's farm income (1949, $9,220,000). Total value of truck crops for 1950 was $276,529,000 (a 6% decrease from 1949), value of field crops was $596,640,000 (a 4% increase) and fruit and nut crop value was $563,740,000 (a 46% increase).

Manufacturing.—Employment in California manufacturing industries reached 953,000 in Sept. 1951. Civilian employment reached an all-time peak of 4,669,000 at the same time, while unemployment dropped to 133,000 as compared with 164,000 in Sept. 1950. Retail sales for 1950 were approximately $12,107,674,000, while new construction amounted to about $2,875,000,000.

During 1950 an average of 758,800 wage and salary workers were employed in California manufacturing industries. In production of nondurable goods 332,700 were employed, and 426,100 were employed in manufacture of durable goods. (D. C. Cr.)

Mineral Production.—Table III shows the tonnage and value of mineral production in the state in 1949 for those commodities whose value exceeded $100,000, and the corresponding data for 1950, so far as they were available at the close of 1951.

California stands second among the states in total value of mineral production (more than half of which is derived from petroleum and natural gas) and also second as a gold producer.

Canada.

A member of the Commonwealth of Nations, Canada is a federal union covering all of North America north of the United States except Alaska. Provinces: Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba, British Columbia, Prince Edward Island, Alberta, Saskatchewan, Newfoundland. Outside the provincial boundaries are the Yukon and the Northwest Territories, under federal jurisdiction.

Area: 3,843,144 sq.mi.; capital: Ottawa (*q.v.*); largest English city: Toronto (*q.v.*); largest French city: Montreal (*q.v.*); governor general: Viscount Alexander of Tunis; prime minister: Louis Stephen St. Laurent (*q.v.*); population (June 1951 census, preliminary figure): 13,893,208.

History.—Several federal by-elections were held during 1951. The Conservatives held the seats of Calgary West and Waterloo South, and won the seats of Brandon, Winnipeg South Centre and Queens from the Liberals. These results increased the Conservatives' house of commons representation to 46 and reduced the Liberals' to 182 (total 262). There was little direct political activity outside these by-elections, but the losses alerted the Liberals, under Prime Minister St. Laurent, to the political dangers of the increasing cost of living.

Government and Legislation.—The fourth session of the 21st parliament was called on Feb. 14 and adjourned June 30, and was a heavy session in terms of legislation. Emergency powers were given to the government to act if the security of the nation were threatened; a new department of defense production was set up; war veterans' legislation was strengthened. The fifth session of the 21st parliament was convened on Oct. 9 and ran to about the end of the year. It was marked by legislation creating an authority to deepen the St. Lawrence seaway, to provide increased old-age security and to curb price fixing in the retail field

Constitution.—Early in May St. Laurent announced that all ten provinces had agreed to the terms of an amendment to the British North America act to permit the federal government to pay old-age pensions to all persons 70 years of age and over without a means test; near the end of the month the British parliament passed the necessary amendment to the B.N.A. act in five minutes without discussion. In October the supreme court of Canada, in a unanimous ruling, established the constitutional power of parliament to control interprovincial and international highway traffic.

Provincial and federal authorities continued to work on a formula for obtaining constitutional amendments, and Stuart Garson, justice minister, announced agreement on 146 sections of the B.N.A. act. The federal government refused to allow an increase or extension of a provincial turnover tax. At the end of 1951, renewed federal-provincial tax agreements were in the offing, to supersede the existing agreements signed with all prov-

inces except Ontario and Quebec in 1947 and expiring in 1952.

External Relations.—Canadian and U.S. civil defense chiefs reached an agreement on joint civil defense research, planning, organization and training. The United States voluntarily gave up certain rights conferred for 99 years by the 1941 agreement on four Newfoundland bases. Therefore the Canadian government extended security laws to protect the security interests of U.S. forces in Canada, and the U.S. recognized Canadian legal jurisdiction over Canadian citizens on the leased bases.

In July a government proclamation ended the state of war between Canada and Germany, which had existed since Sept. 10, 1939; in September Canada signed the peace treaty with Japan; in September also the North Atlantic Treaty organization council met in Ottawa, Ont. Throughout the year Canada donated $195,000,000 of arms to NATO countries, including enough to equip a division for Italy and a division for Belgium. Parliament accepted a government resolution approving Canada's continued "participation in the efforts being made through the United Nations to establish international peace, and in particular to defeat aggression and restore peace in Korea." Parliament voted $7,250,000 to Korean relief through the U.N., and an additional $45,400,000 to cover aid to Asia under the Colombo plan, technical assistance to Pakistan by special agreement, and wheat to India. Parliament also passed conventions with France and Sweden to avoid double taxation and to prevent fiscal evasion, and ratified the international convention for the regulation of whaling.

Defense and Internal Security.—With increasing uneasiness in international affairs, the Canadian government paid increasing attention to the problems of national security. Brooke Claxton, minister of national defense, announced a three-year rearmament program to cost $5,000,000,000, which had as objectives: (1) 40 royal Canadian air force squadrons, (2) a 100-ship navy and (3) a 115,000-man army. It was estimated that 10% of the national income would be necessary to finance the plan. The defense research board announced several new weapons, including armour-piercing shells, an improved anti-tank gun and Canadian-made guided missiles. The air force created new jet fighter squadrons and set up a ground observation corps; the army sent a first contingent of 5,500 men to west Germany as part of the NATO requirements; keels were put down for 12 special antisubmarine vessels, costing $60,000,000. Women's military divisions were reorganized. Paul Martin, minister of national health and welfare, announced that civil defense against atomic attack entered its operational stage with the creation of a $1,000,000 radar network, the provision of the world's first radiation detection course for instructors and the full-time lease of communication systems to warn the populace of an impending air attack.

Internal security measures included an extension of the power of the federal government to take citizenship rights away from Canadians who proved to be disloyal. However, those affected by the legislation had the right to a hearing before a commission. To help prevent sabotage against Canada's vulnerable system of inland waterways, new regulations required all seamen on Canadian ships on the Great Lakes to carry cards issued by the department of labour on recommendation of the royal Canadian mounted police.

Veterans' Affairs.—The federal government extended existing legislation for World War II veterans to members of Canada's special forces serving in Korea and Europe. Pensions to veterans were increased; more help was given to widows of war veterans when children wished to continue their education beyond the statutory age limit; the provisions of the Veterans' Business and Professional Loans act and the Veterans' Insurance act were expanded and the time limit of their availability was extended. On Sept. 8, 1951, 92,519 World War II veterans were receiving pensions.

PRINCESS ELIZABETH and the duke of Edinburgh at a command performance of the Winnipeg Ballet company during the royal couple's tour of Canada in Oct. 1951

Economic Controls.—An Emergency Powers act gave the government the right to control (by order in council) not only things directly pertaining to defense but also trading, exploitation, importation, production and manufacture. Consumer credit regulations were tightened. Before 1951 was far advanced, informal controls of strategic defense supplies were replaced by a complete and strict priority system. Export permits were required for about 150 commodities, in an effort to keep them out of Communist-controlled countries. The foreign exchange controls imposed in 1939 were abolished in December, and Canada became the first controlled-currency country to abandon World War II money restrictions, Parliament rejected, by a vote of 116 to 19, a motion to impose direct price controls. All provinces made provisions to retain rent controls dropped by the federal government April 30, 1951.

Taxation.—Faced with mounting defense costs, Finance Minister Douglas Abbott's 1951–52 budget announced new and increased tax levies. Income taxes went up 20%; sales tax went up 2%; a special 15% excise tax was placed on a limited range of hard consumer goods; the special excise tax on automobiles and a long line of luxury articles was boosted 5%. At the autumn session of parliament, the finance minister announced further tax increases, of 2% on the taxable incomes of corporations and of 2% on the taxable incomes of individuals (returns from both earmarked for old-age pension payments).

Labour Relations.—An Ontario court granted an injunction against the use by picketers of picketing methods that were in themselves unlawful (such as threats and violence), and thus established a distinction between proper and improper picketing. Parliament approved an International Labour office convention fixing minimum age for employment at sea. For the first nine months of 1951 (1950 figures in parentheses) there were 199 (130) strikes and lockouts, involving 65,096 (166,601) workers, with a time loss of 667,622 (1,300,331) days.

Arctic Developments.—The federal government sent the defense research board's motor vessel "Cancolim II" on a 6,000-mi. tour to study the possible uses of the western arctic by enemy forces; it also pushed ahead with a string of air stations across the arctic. Department of national defense studies in the arctic included the insect problem, radio-frequency cold exposure treatments, and winter clothing (by Exercise "Mukluk"). The department of fisheries ketch "Calanus" studied arctic char at Frobisher bay and plankton in the Beaufort sea. The Arctic Institute of North America examined glacier flow on the Alaska-Yukon boundary. A second expedition was sent to Chubb (world's largest meteor) crater in Ungava.

Eskimos and Indians.—A new pattern of Eskimo education was established by steps to create a system of permanent local schools to replace strategically placed boarding schools. A $12,000 federal grant was used to continue research into poliomyelitis among the Eskimos. The federal government completely revised the Indian act, and it became in effect a new charter for Canadian Indians, giving them greater authority in the administration of their own property and affairs; Indian women were entitled to vote in band council elections.

Finance.—Actual 1950–51 federal revenues totalled $3,105,000,000 and expenditures $2,901,844,000. The 1950–51 surplus reduced the national debt to $11,441,100,000 (the World War II peak was $13,421,405,490). Estimated expenditures for 1951–52 fiscal year were set at $3,586,915,657. On Oct. 31, 1951, there was a 1951–52 budget surplus of $604,700,000, but defense spending was not in full flow. At the end of 1951 Canada's reserves of U.S. dollars reached $1,779,000,000 (Nov. 1948, $480,000,000).

National Income.—Preliminary net national income at factor cost for 1950 was as follows: salaries, wages and supplementary labour income $8,300,000,000; military pay and allowances $137,000,000; investment income $2,996,000,000; agriculture and unincorporated businesses $2,875,000,000.

Trade.—Exports for Aug. 1951 (compared with the monthly average for 1950) totalled $349,800,000 ($259,900,000) and imports totalled $370,640,000 ($264,520,000). Canada's total foreign trade for the first nine months of 1951 came to $5,960,200,000, compared with $4,507,700,000 for the similar 1950 period.

Communications.—The Canadian Broadcasting corporation continued to operate 12 high-powered stations in the larger population centres, and hold regulatory powers over the 125 privately owned stations upon which the smaller centres depend for broadcast services. The private broadcasters, organized as the Canadian Association of Broadcasters, in representations to parliament's special committee on broadcasting urged that the regulatory functions vested in the C.B.C. be entrusted to an impartial body similar to the United States Federal Communications commission. The C.B.C.'s new headquarters, Radio Canada building in Montreal, was opened in May to serve the 3,323,000 Canadian radio receivers. Canada's first television stations were in an advanced state of construction in Montreal and Toronto, and contracts were let for a 14-tower microwave circuit from Buffalo, N.Y., to Montreal via Toronto and Ottawa. There were about 100,000 television receivers in Canada at the end of 1951. During the year telegraph and telephone rates were raised.

Transportation.—In 1951 Trans-Canada Air Lines, Ltd., announced it had flown 21,839,355 mi. and carried 820,000 passengers in 1950; during 1951 T.C.A. opened a direct Montreal-Paris service. The government created a new national aeronautical establishment to provide continuing support for co-ordinated research and orderly development in all branches of aviation. The government revised the Railway act to establish rate uniformity recommended by the Turgeon royal commission. Freight rates advanced 12%. In March the department of national defense announced that 40 ships were under construction for the Canadian navy; and in June the department reported the program was expanded by the laying of 12 more keels. In December alone, 70,000 tons of new ships, oil tankers and bulk ore and grain carriers, were launched. The end of the year saw the completion of contracts in eight of ten provinces, representing $50,000,000 or one-sixth of the total trans-Canada highway costs.

Agriculture.—Unseasonal autumn weather left 32% of the 562,000,000 bu. wheat crop of 1951 under snow, and legislation was passed to help farmers with short-term loans. Other federal legislation included creation of a Canadian dairy products board to establish national standards and regulations of interprovincial and international trade; creation of an agricultural products board for the purchase and sale of farm products on a country-to-country basis; and extension of the Farm Improvement Loans act for three years. Parliament voted $65,000,000 for continued water storage as a farm rehabilitation measure. In the 1946–51 period the government spent $10,000,000 to support farm prices; in the 1939–51 period the farm price of agricultural products went up 210.2%. Cash farm income for Jan.-Sept. 1951 was $1,864,900,000, compared with $1,487,600,000 for the same period of 1950 and with $2,169,251,000 for all of 1950.

Industry.—Volume indexes of industrial production (1935–39: 100) in Aug. 1951 (with 1950 monthly averages in parentheses) were: total, 205.3 (198.3); mining, 168.1 (147.5); total manufactures, 210.4 (207.6); nondurable manufactures, 191.4 (197.9); durable manufactures, 243.1 (241.2); electric power, 219.5 (194.4).

Employment.—In Aug. 1951 the Canadian labour force (compared to Aug. 1950) was: agricultural, 1,090,000 (1,153,000); nonagricultural, 4,331,000 (4,171,000); with jobs, 5,343,000 (5,221,000); without jobs and seeking work, 78,000 (103,000).

Wages and Hours.—Average weekly salaries and wages during Aug. 1951: industrial composite $50.16; forestry $47.49; mining $60.77; manufacturing $51.68; construction $49.48; transportation, storage and communication $54.20; public utilities $56.32; trade $43.85; finance, insurance and real estate $46.27; service $31.21. Average hours worked per week during Aug. 1951: metal mining 43.3; coal mining 41.2; manufacturing durable goods 41.4; manufacturing nondurable goods 41.3; construction 40.7.

Natural Resources.—British Columbia's first important oil discovery was made in the Fort St. John area on the Alaska highway, and Manitoba tapped its first successful oil well. Continuing drilling in Alberta and Saskatchewan moved Canada up to the world's tenth largest oil-producing nation. In 1951 Canadian mines produced $1,228,000,000 of minerals (1950—$1,040,000,000); though some of the increase was due to higher metal prices, volume of production was also higher. The Quebec-Labrador iron ore discoveries spurred arctic prospecting, and ores of commercial value were reported under the snowy wastes of Baffin Island. In the 1948–51 period, more than 500 deposits of uranium were reported. First-stage development of hydroelectric power near Kitimat, B.C., heralded construction of a $500,000,000 aluminum plant there.

Canadian Literature.

Fiction.—In 1951, of the 125 or so English Canadians who published books, there were only 16 novelists, 2 poets and 1 dramatist to represent imaginative literature. The 1951 reader, looking for the Canadian novelist who went beyond the mechanics of a good yarn to some instructive criticism of life (Canadian or otherwise), had to look hard and long, and his search was lamentably seldom rewarded. Hugh MacLennan's *Each Man's Son,* dealing with events in a Nova Scotia mining community, and Morley Callaghan's *The Loved and the Lost,* about racial problems in Montreal, stated problems without suggesting answers. Better results came from two newcomers to the fiction field: dramatist Robertson Davies' *Tempest-Tost* satirized Canadian small-town life with an alertly roving eye; poet A. M. Klein's *The Second Scroll* described and analyzed various spiritual values. Some attempts to deal with Canadian living problems were to be found in W. G. Hardy's *The Unfulfilled,* George Glay's *Beggars Might Ride,* John Cornish's *The Provincials,* Hugh Garner's *Cabbage Town,* Lois Edwards' *My Heart in Hiding* and Louise Riley's *One Happy Moment,* but the attempts were disappointing, especially considering the general technical competence of the various works. Gabrielle Roy's *Where Nests the Water Hen* and Kristine Kristofferson's *Tanya* both had scenes laid in Manitoba, but whereas the latter stressed actionful plot, the former was practically plotless. When it came to just plain storytelling, veteran Will R. Bird's *So Much to Record,* dealing with the Nova Scotia scene, and Luella Creighton's *High Bright Buggy Wheels,* about an Ontario Mennonite settlement, led the fiction field.

Poetry and Drama.—Other representatives of imaginative literature were scarce. *The Mulgrave Road* by Charles Bruce, however, exhibited sharp insight into Nova Scotia's special qualities, and *The Victorian House and Other Poems* by Philip Child was an arresting study of the mind's persistent effort to overcome personality.

Nonfiction.—The output of 1951 factual books might be divided into two categories—those which could be called examples of personal literature and those which could be called examples of handbook literature. Among the former, a few were simple autobiography, such as Billy Button's *I Married an Artist,* Kenneth M. Wells's *Up Medonte Way,* Barbara Ann Scott's *Skate with Me* and Oliver Philpot's *Stolen Journey;* some were straightforward travel, such as Lyn Harrington's *Manitoba Roundabout,* Lilian Maxwell's *'Round New Brunswick Roads,* John and Marjorie Mackenzie's *Quebec in Your Car,* Blodwen Davies' *Quebec: Portrait of a Province,* Evelyn Earle's *Leeds the Lovely* and Jessie Lawson and Jean Sweet's *This Is New Brunswick.* It was an indicative fact that the autobiographies were light in vein, and that the travel was Canadian. There were but two peaks in that plain of writing: Barbara Cormack's *Local Rag* was a uniquely different autobiographical novel (but not novel enough to be real fiction), with its material projected through the files of a small prairie town weekly newspaper; Judith Robinson's *As We Came By* was travel (in Europe) with a sharp eye and a sharper tongue. Works of humour included Harry Symons' *The Bored Meeting,* Jan Hilliard's *The Salt-Box* and John Robins' *Cottage Cheese.*

For the most part the rest of the factual books published by Canadian writers during 1951 were handbooks. Some, to be sure, were handbooks almost achieving literary status, such as L. L. Snyder's *Ontario Birds,* Daniel McCowan's *Tidewater to Timberline,* Roderick Haig-Brown's *Measure of the Year,* John Murray Gibbon's *Romance of the Canadian Canoe,* Josephine Phelan's *Ardent Exile* and E. K. Brown's *Rhythm in the Novel,* but the bulk of them were merely recitals of history, politics, geography, religion, government and agriculture, to list about half the things that attracted Canadian nonfiction writers in 1951.

Juvenile.—The pronounced drop in production of nonfiction for young readers was not counterbalanced by a more copious flow of juvenile novels. However, there were a few teen-age novels that were appealing. Olive Knox's *Little Giant* (Henry Kelsey) was the only historical story. Career themes were more popular: Jack Hambleton's *Tom Walden, Cub Reporter* (newspaper), Lyn Cook's *The Little Magic Fiddler* (music) and Foster Hewitt's *Along Olympic Road* (athletics). But few Canadian writers in the juvenile field could surpass veteran Dickson Reynolds for thrill and dash and implicit moralizing, of which her *Angry River,* describing the Fraser river on rampage, was a good example. A new and promising writer, Audrey McKim, appeared with *Here Comes Dirk,* the story of a Dutch boy's Canadianization. (*See* also LITERARY PRIZES.) (C. CY.)

Canals and Inland Waterways.

Of the estimated 65,000 mi. of potential inland waterways in the United States, approximately 28,000 mi. had been improved by the end of 1951 for navigation by commercial and pleasure craft. All operations and maintenance of the system, which included 185 harbours and 400 locks, is the responsibility of the corps of engineers, department of the army, under the direction of the congress.

The principal components of the over-all, interrelated system of rivers, lakes, bays and canals include the Great Lakes, the Mississippi river system, the Illinois waterway, the New York state canal system, the Cape Cod canal, the Chesapeake and Delaware canal, the Atlantic Intra-Coastal waterway, the Gulf Intra-Coastal waterway, the Sacramento river system and the Columbia river system.

The Rivers and Harbors act of 1951 provided for $125,192,613 for the construction of 43 authorized projects in 29 states. An additional $61,287,000 was appropriated for maintenance, operation and care of the nation's vast network of ports and inland waterways, and $500,000 for planning, preliminary examinations and surveys of new projects. Also, in addition, the lower Mississippi river and the Sacramento river in California received separate appropriations of $60,500,000 and $1,000,000 respectively for construction, maintenance and operations.

THE "CLIFFS VICTORY," 620-ft. ore carrier, gliding past the raised spans of the Chicago river at the end of her journey from New Orleans, La., in 1951. The converted victory ship was the largest vessel to have passed through the Illinois waterways' system of locks to that date

Among the principal projects on which construction was begun or continued during the year were the McNary lock and dam and the Chief Joseph dam on the Columbia river in the interest of navigation, power development and irrigation; the New York and New Jersey channels; Demopolis lock and dam on the Warrior river, Ala.; Houston ship channel, Tex.; the Neches and Angelina rivers and the Sabine-Neches waterway in Texas; the lateral canal and lock project on the Mississippi river at Chain of Rocks, near St. Louis, Mo.; Morgantown dam and lock no. 2 on the Monongahela river in Pennsylvania; Missouri river between its mouth and Sioux City, Ia.; Pearl river in Mississippi and Louisiana; San Diego river and Mission bay, Calif.; Jim Woodruff lock and dam, Apalachicola river, Fla. (*See* also FLOODS AND FLOOD CONTROL; RIVERS AND HARBOURS.)

According to preliminary estimates, the total net water-borne commerce of the United States, eliminating all known duplications of traffic between rivers and ports, was 820,582,362 short tons in the calendar year 1950. Ocean traffic, foreign and coastwise, aggregated 285,744,943 tons.

United States water-borne commerce on the Great Lakes totalled 169,879,433 tons, aggregating 111,687,340,000 ton-miles. Inland waterway commerce, excluding the Great Lakes, totalled 51,256,637,000 ton-miles, including the deep-sea traffic on the Mississippi river below Baton Rouge, La. Of this total, the Mississippi river system accounted for 33,597,816,000 ton-miles.

Preliminary tonnage figures indicated that the following ten were the leading U.S. ocean ports in 1950; New York, N.Y., 186,527,019; Houston, Tex., 40,825,048; Philadelphia, Pa., 37,220,812; Baltimore, Md., 35,640,406; New Orleans, La., 35,125,047; Norfolk, Va., 25,049,913; Beaumont, Tex., 21,425,323; Los Angeles, Calif., 20,119,966; Boston, Mass., 19,446,154; Port Arthur, Tex., 19,323,487. (G. Hb.)

Canada.—With the general approval of parliament, the federal government passed an act to establish the St. Lawrence Seaway authority "for the purposes of acquiring lands for and constructing, maintaining and operating all such works as may be necessary to provide and maintain, either wholly in Canada or in conjunction with works undertaken by an appropriate authority in the United States, a deep waterway between the port of Montreal and Lake Erie." Parliament voted $4,523,107 for the maintenance and operation of the canal services for 1951–52, plus $2,013,409 for the continued dredging of the St. Lawrence river ship channel below Montreal. Tonnages taken up and down through the three major lock systems of the St. Lawrence-Great Lakes system set records in the April-Oct. 1951 navigation season (1950 in parentheses): Sault Ste. Marie (Canadian-U.S.) 107,729,730 (93,280,527); Sault Ste. Marie (Canadian only) 2,285,699 (1,886,881); Welland 13,774,107 (12,400,905); St. Lawrence 8,692,183 (8,648,438). (*See* also Electrical Industries.) (C. Cy.)

Great Britain.—The third report of the British Transport commission was published in July 1951. It recorded that during 1950 work was advanced on a new lock at Newark, Nottinghamshire, to accommodate four standard Trent craft—the old lock could take only one such boat. Dredging was carried out on the Trent navigation to provide an improved channel to a general minimum depth of five feet. It was decided to improve the Severn channels to enable craft carrying 400 tons to navigate to Worcester, and to carry out works above Worcester to enable existing craft to load up to 150 tons. Total waterway traffic in 1950 was 11,802,000 tons, an increase of 4.2% over 1949. There was a deficit of £93,795 on the carrying business but an amount of £144,141 accrued to the executive as toll payments in respect of that business. As from May 1950, the executive increased statutory charges by 16⅔% and also raised non-statutory charges where appropriate.

France.—The new Jeu de Mail lock, with a reclaimed drop of 1.43 m., on the canal from Bourbourg to Dunkirk, was brought into use in place of the old lock destroyed in World War II. On a branch of the Neuffouse canal around St. Omer, work on the Flandres lock, with a reclaimed drop of 3.97 m., was further advanced; it would replace the Haut-Pont and St.-Bertin locks and would accommodate barges, vessels up to 600 tons and lighters. Progress was made with the new lock on a branch of the Deule river, at Dow: there were to be two basins, in tandem, and a reclaimed drop of 2.82 m. At the old Lens lock on the Lens canal reconstruction continued; this was designed to repair the effect of mining subsidence and, with a reclaimed drop of 7.7 m., to allow vessels of 600 tons to be docked.

Germany.—Removal of wreckage from navigable rivers continued; shipping traffic operated normally. Progress was made in waterway extensions on the Main river Near Würzburg and at Neckar near Heilbronn (Württemberg). A double lock to lower and raise ships on the Mosel river was completed. Low-water regulation was improved on the Danube. Extension work continued on the Dortmund-Ems canal. On the Kiel canal, slopes, locks and retaining sluices were renewed.

Netherlands.—A new Amsterdam-Rhine canal was opened with the object of shortening the route between the lower Rhine towns and the port of Amsterdam.

U.S.S.R.—It was decided to speed up the work on the Stalingrad-Kalach ship canal in order to finish it in 1952 and thus establish a system joining the Caspian and White seas with the Sea of Azov and the Black sea. (*See* also Aqueducts.)

Canasta.

In the U.S. canasta remained the most-played card game in 1951, though interest in it diminished. Many who had turned from other games, such as contract bridge, pinochle and several games that, like canasta, are members of the rummy family, returned to those games. In England and Scotland, canasta increased rapidly in popularity and was perhaps as much played as contract bridge, though it did not achieve the fad stage as it had in the U.S. in 1949 and 1950.

Early in 1951 new international canasta laws were published, jointly agreed to by commissions representing the U.S. and Argentina. These laws, which made few changes in the procedure of play, were later adopted by British and French players. The majority of players in the U.S. and South America rejected the "official" laws in one respect: A player is not permitted to take the discard pile so as to add the top card to a completed canasta. The international laws permit a player to do so.

During 1951 a canasta variant called "samba" grew in popularity. This game is played with three 52-card decks plus six jokers. Each player is dealt 15 cards and when he draws from the stock takes 2 cards, but discards only 1 in each turn. Sequences may be melded up to seven cards in length (never including a wild card or three-spot) and a seven-card sequence, called a samba, ranks as a canasta and scores a bonus of 1,500 points. Game is 10,000 points and when a side's score reaches 7,000, it needs 150 for its initial meld. Otherwise the procedure is substantially the same as in canasta. (A. H. Md.)

Cancer.

The concerted and intensive scientific and humanitarian attack on cancer, by dissemination of information to the medical profession and to the laity, by diagnostic and therapeutic service to the cancer patient, and by research, continued to gain momentum during 1951. These activities were given unprecedented monetary support by a cancer-conscious public through governmental appropriations and voluntary agencies. Contributing materially to the greatly increased public interest were several motion pictures on various aspects of cancer control, notable among which was *Breast Self-Examination,* which was seen by more than 1,000,000 women.

Considerable funds were apportioned to the training of scientists and clinicians, and to fundamental research in biology and in its ancillary sciences, studies often without immediately apparent oncologic significance. Widely diverse investigations under many disciplines of science focused with increasing definition on the nature, early diagnosis and treatment of cancer. Biologist, biochemist, biophysicist, pathologist, cytologist, virologist and clinician worked as a unit toward an understanding of the fundamental mechanisms of normal cellular growth as an essential prerequisite to an insight into the abnormal mechanism of malignant growth. The electron microscope, which shows structural cellular details of approximately ten times the resolution of the ordinary microscope, revealed still further minutiae of the chromosome, the point of departure of the precancerous from the normal cell, and by its use the relation of virus disease to cancer was further elucidated. Ultra-violet radiation was utilized to distinguish normal from cancer cells under the conventional microscope. Cancer cells absorb more of a fluorescent dye than do normal cells and, after ultra-violet irradiation, they emit twice as much light and may be counted mechanically on the microscopic slide by an electronic instrument, the microfluorometric scanner. Light energy from the self-luminous cells is converted by a photocell into a voltage pulse which activates

CANCER GROWN from a tiny transplant, protruding from the side of a mouse. It was the first successful transplant of experimental thyroid cancers following six years of research at the National Cancer institute, Bethesda, Md.

an electronic counting circuit. An entire microscopic slide can be scanned in four minutes, thus greatly facilitating the cytologic diagnosis in secretions from the uterine cervix and other anatomical sites in the routine screening of great numbers of examinees. Cytologic diagnosis of gastric cancer was greatly facilitated by development of an abrasive balloon which, when inflated in the stomach, gathers exfoliated epithelial cells for microscopic examination. Cancers so small as to elude diagnosis by any other method were diagnosed. A motion picture of this method of exfoliative cytologic diagnosis was widely circulated to the medical profession.

Radioactive isotopes of several of the chemical elements were put to work in the battle against cancer. In the study of intermediary metabolism many compounds were tagged with radioactive carbon, iodine, sulphur, phosphorus, etc., enabling the investigator to follow their courses through the body. Radioisotopes were also used in treatment, iodine in cancer of the thyroid, cobalt in bone metastases and cancer of the uterine cervix, etc.

A two-year statistical study of the aetiologic importance of smoking in cancer of the lung was initiated.

Authoritative atlases of the pathology of cancer of various body regions and corresponding clinical monographs prepared by leading specialists were widely distributed.

Organized utilization of pathologic material from spontaneous cancer in domestic, abattoir and zoological garden animals was initiated.

Progress in hormone treatment of cancer included a partially successful search for a testosteronelike compound, methylandrostenediol, with antineoplastic effect and without virilizing action when used in inoperable cancer of the breast.

Use of a 2,000-v. X-ray machine was made possible by development of a device for continually rotating the patient with the lesion at the centre of the X-ray focus, thus obviating the otherwise unavoidable surface damage.

There were the customarily frequent hopeful announcements, some from high places, of cancer tests and cures, each of which in turn was found wanting.

The clinician's attention was focused on early diagnosis which is possible only through co-operation of the apparently healthy individual by presenting himself to his physician or to an organized detection centre for frequent physical examination. (*See* also ATOMIC ENERGY; CHEMOTHERAPY; MEDICINE; SURGERY; X-RAY AND RADIOLOGY.) (CH. C.)

Candy.

As the year 1951 drew to a close there was the likelihood that the dollar volume of candy sales in the United States for the year would exceed the 1948 record of $1,001,000,000. The bureau of the census reported that for the first ten months of 1951, 1,365 manufacturers, employing 75,000 persons, recorded sales of $788,000,000 or an increase of 4% compared with those of the corresponding period of 1950. Total dollar volume sales for 1950 just shaded the $1,000,000,000 figure, compared with $900,000,000 reported by the confectionery business for 1949.

Tonnage-wise, the latest available figures at the close of the year pointed to an estimated volume of 2,668,800,000 lb. or a decline of 4% compared with the 2,780,000,000 lb. recorded for 1950.

The industry's tonnage record, 2,804,000,000 lb., was established in 1944.

The most significant development in the candy industry during 1951 was the move by many manufacturers toward a program of diversification in products offered and in markets covered. Whereas in previous years more than half the industry's tonnage was distributed by jobbers principally through confectionery stores, ice cream parlours and cigar stands and the balance largely through variety and drug store chains, a definite change toward mass marketing of candy through newly developed outlets was noted in 1951.

As a result, new types of confections, new packages and variations of well-known bar goods were displayed and sold in large quantities in supermarkets and by an expanded vending-machine field.

The industry's 1951 tonnage was broken down as follows: bar goods, 40%; other five- and ten-cent items, 10%; package goods, 25%; bulk goods, 20%; and one- and two-cent items, 5%. Chocolate-coated and chocolate-containing candies continued to lead the field in consumer popularity, and with the price of cocoa beans decreasing toward the end of the year (spot cocoa, 28 cents, futures, 25.50 cents), some of the larger chocolate firms were conducting large-scale consumer promotions on one-pound chocolate bars, at 49 to 55 cents per bar. The average price of candy at the wholesale level was slightly higher than the 34-cent average price reported for 1950 and the 33.7-cent price recorded for 1949.

Ten years before, the average wholesale price of candy per pound was 15.9 cents.

As in previous years, the United States continued to be the greatest candy-producing country in the world, although Great Britain still led the world in per capita consumption. The per capita consumption in the United States in 1951 was estimated at slightly less than 18 lb.

The all-time record, 20.5 lb., was established in 1944, the low, 13 lb., in 1932 and 1933.

It was estimated that more than 10,000,000 lb. of candy were imported into the U.S. in 1951, compared with about 6,000,000 lb. in 1950, 3,364,000 lb. in 1949 and 2,936,000 lb. in 1948. Candy exports in 1951 declined to an estimated 8,000,000 lb. compared with 10,000,000 lb. in 1950 and 13,359,000 lb. in 1949. (H. D. G.)

Cane Sugar: *see* SUGAR.

Canning Industry.

The United States and territorial pack of canned fruits, fruit juices, fruit and vegetable specialties, vegetables, milk, fish and meat in 1951 totalled approximately 640,000,000 standard cases (preliminary estimate) compared with 566,300,000 standard cases to 1950. Preliminary statistics for the 1951 pack compared with that for

1950, in terms of millions of standard cases, were shown as in the following table:

	1951	1950
Fruits	90.0	82.0
Fruit juices	72.0	60.8
Vegetables	220.0	172.8
Fruit and vegetable specialties	120.0	115.0
Milk	71.9	68.9
Fish	24.2	29.8
Meat*	41.7	37.0
Total	639.8	566.3

*Total pounds of meat canned divided by factor of 45.

With the exception of canned fish, which showed a substantial decrease, all packs were significantly larger than in 1950. On the basis of year-end estimates, the total pack increase for 1951 over 1950 was 13%.

As in 1950, retail prices of canned fruits and vegetables, according to data from the United States bureau of labour statistics, remained closer to pre-World War II levels than other foods, showing an increase of about 66% as compared with about 125% for all foods.

The bureau of agricultural economics of the United States department of agriculture estimated the per capita consumption of canned fruits and vegetables at 57% more than the 1935–39 average. Principal increases were noted in canned fruit, 14.9 lb. to 19.7 lb.; canned fruit juices, 3.9 lb. to 15.5 lb.; and canned vegetables, 29.9 lb. to 41.5 lb.

The International Tin Study group estimated the world production of metallic tin for January-April 1951 at 55,900 long tons with consumption at 47,300 tons during this period. Production and consumption in the same period of 1950 were 55,000 and 45,400 tons, respectively. At the September meeting in Rome of the International Tin Study group, mine production for 1951 was estimated at 168,000 long tons with consumption at 147,000 tons. Production and consumption for 1950 were 172,100 and 147,500 tons, respectively. In Jan. 1951 commercial stocks (metallic tin and concentrates) in the hands of the United Nations amounted to 104,400 long tons plus stock piles estimated at more than 160,000 tons. (*See* also Tin.)

Advances in technological developments in the canning industry included extended use of high-short (high temperature-short time) processing which utilizes the principles of agitation and aseptic filling. The latter, which involves rapid heating to high temperatures (280° F.–300° F.) followed by filling into sterile containers under conditions which prevent contamination, came into increasing use in canning milk.

Continuing studies were conducted on sterilization by means of antibiotics, particularly subtilin. In various publications and releases the bureau of agricultural and industrial chemistry of the United States department of agriculture stated that subtilin, with mild heat, would destroy heat-resistant bacterial spores that are important in spoilage of canned foods and particularly *Clostridium botulinum,* the only sporeformer associated with food poisoning. This claim was not substantiated by industry research nor had the use of other antibiotics shown promise as an alternate for heat sterilization.

In the field of fundamental research further progress was made in studies relating to sterilization by means of cathode rays. Interest in the possible utilization of radioactivity for sterilization was increased through the announcement by the United States Atomic Energy commission that it expected to be able to make available to industry large quantities of by-product radioactive materials known as "gross fission products" which are produced as waste products by the operation of nuclear chain reactors. Certain of these fission products emit gamma-rays which have greater penetrative power than cathode rays and which are also lethal to bacteria. For experimental purposes, radioactive sources (cobalt 60) which produce gamma radiation were located in several universities where sterilization experiments were in progress. However, no commercial application of sterilization of foods by radioactivity was in sight.

(E. J. C.)

Other Countries.—The event of the year was the World Congress on Canning (Paris, Oct. 16–19) organized by the Comité International Permanent de la Conserve. Developments mentioned by British delegates included a rapid "flame peeling" process for fruits, tests on aluminum cans for fruits and vegetables and the use of electrolytic tin plate for canning vegetables. G. G. Knock (South Africa) said that 12 years earlier the total output of South Africa's canneries was 55,000,000 lb., whereas it was now about five times that figure. W. Krehl of the Yale Nutrition laboratory, U.S., said that more was known about the nutritional value of canned foods than about any other type of processed food. F. Jakobsen (Sweden) mentioned new types of modified phenolic lacquers used for deep-drawn cans in the U.S. and in Scandinavia.

Statistics published during the year by the British ministry of food showed that the United Kingdom production of canned vegetables increased from 300,800 long tons in 1949 to 322,000 tons in 1950, including 143,600 tons of processed dried peas and 93,400 tons of baked beans. Canned fruit fell from 89,100 tons to 75,100, including 35,200 tons of plums and 16,000 tons of apples. Canned soups fell from 71,200 tons to 60,300, and homogenized baby foods from 7,200 tons to 5,100.

The International Tin Study group reported that of a world consumption of nearly 5,750,000 tons of tin plate in 1950, the American continent used 4,152,000 tons, Europe 1,026,000 tons, Asia 250,000 tons, Australasia 124,000 tons and Africa 96,000 tons. Despite a world production approaching 6,000,000 tons in 1951 there was a shortage of tin plate in most countries.

The Colonial Development corporation erected a cannery for turtle soup on Grand Cayman Island, British West Indies, to process 3,000 turtles a year. In Portugal, after several years with poor yields of fish, the sardine-canning industry improved, having begun to revive in the middle of 1950. In Malaya, the pineapple-canning industry produced about 1,000,000 cases against only 9,000 in 1946. There were also considerable developments in pineapple canning in Australia and South Africa. South Africa's crop was valued at £1,000,000.

Cartography.

The Korean war and general world unrest had a noticeable effect on cartography during the year 1951. Military mapping expanded considerably, with the production of a large number of topographic maps and models. Nonmilitary mapping trended along more routine lines and important new programs were lacking. Publication of outstanding individual maps and atlases, however, continued as in past years with several outstanding achievements.

United States.—In 1951 a new topographic map series was released for public sale through the U.S. geological survey. The maps, at a scale of 1:250,000, were compiled by the army map service, starting in 1946, to fill military needs for a medium-scale map of the United States. Of the 469 sheets to cover the United States, 84 were available by the close of the year. The maps, with both contours and shading to express relief, had considerable detail on roads, railroads, towns and forests. Each map covered 2° of longitude and 1° of latitude and was compiled from existing topographic maps or from special high-altitude aerial photographs designed for medium-scale mapping.

The topographic division of the U.S. geological survey began the publication in March 1951 of a quarterly quasi-official *Bulletin* dealing with topographic mapping and cartography. The publication, the first U.S. government periodical dealing with mapping, contained data on current mapping activities and new technical developments, as well as interesting personal experiences of mappers.

In July the U.S. geological survey published a map showing the status of geologic mapping in the United States. This 1:5,000,000-scale map, showing coverage of published and unpublished geologic maps classified into three scale groups, was a summary of information shown on the state indexes of geologic mapping that were published by the geological survey. The status of geologic mapping was the sixth of a series of inventory-type indexes, the others, dealing with aerial photography, photomosaics, horizontal control, vertical control and topographic maps, having been published previously.

The American Congress on Surveying and Mapping held its 1951 annual meeting in Washington, D.C., June 18–20. There were 663 persons from Canada, the U.S. and many Latin-American countries attending the meetings. The cartographic session was highlighted by a paper describing the importance of cartography in determining boundaries of hydrographic and shore features in the tidelands oil case.

The *Soil Survey Manual*, published by the U.S. department of agriculture as its *Handbook 18* in Aug. 1951, contained a wealth of cartographic information on the preparation of soil maps. About one-third of the 503-page manual was devoted to the principles and methods of processing soil survey data into map form, which made it one of the new texts dealing with specialized, nontopographic cartography available to students.

The second and third of the series of maps that were to compose the *Atlas of Disease* were published in the April and October numbers of the *Geographical Review* (American Geographical society). These maps, depicting the world distribution of cholera and malaria vectors, were compiled by Jacques M. May, and like the others in the series were accompanied by a brief text and bibliography. The map on the distribution of cholera was made possible by a grant of $15,000 from the Upjohn company of Kalamazoo, Mich., in 1949.

Copies of the *Atlas Geográfico General de Mexico* were distributed in 1951, although the cover page carried a publication date of 1949. The atlas was edited by Jorge L. Tamayo and had 24 small-scale, detailed maps covering physical and social subjects. The atlas was accompanied by a two-volume text entitled *Geografía General de Mexico*, which described in considerable detail the physical, social and economic geography of Mexico by regions keyed to the atlas.

Europe.—The ninth general assembly of the International Union of Geodesy and Geophysics was held in Brussels, Belg., Aug. 21 to Sept. 1, 1951. More than 700 delegates from 43 countries attended. From the cartographic standpoint the high light of the meetings was the endorsement by resolutions of the extension of international adjustments of European geodetic control to the Mediterranean area. These adjustments, initiated by the Association of Geodesy, had been under way since 1948, and the work on central and western Europe was completed through the efforts of the U.S. army map service and the U.S. coast and geodetic survey.

The third meeting of the Deutschen Gesellschaft für Kartographie was held at Frankfurt-on-Main, Ger., May 10–11, 1951. This organization resumed meetings on a biennial basis starting in 1947. More than 200 cartographers from various central and western European countries were in attendance.

A new Michelin road map of Spain was published in 1951. This map, in two sheets at a scale of 1:1,000,000, replaced the prewar 1:400,000 series that formerly was standard for Spain and Portugal. The Portuguese part of the series was replaced in 1950 by a new 1:500,000-scale map. With the issuance of the map of Spain, Michelin completed the revision or replacement of its prewar series.

The Italian Touring club world atlas, which was originally issued in 1936, was reprinted in an interim edition in 1951. Although there was little or no revision to the plates, the atlas was the most detailed one covering the world that was available.

Preparation for the International Geographical congress to be held in the United States in the summer of 1952 placed considerable emphasis on cartography. A. Libault of Paris proposed an annual international cartographic competition in which maps portraying physical and social data would be judged on their cartographic merit, and prizes either of cash or scholarships awarded. This suggestion would place cartography in a realm with other sciences where international contests and prizes were a recognized part of the profession.

Reconstitution of the Ordnance Survey library at Surrey, Eng., was undertaken in 1951. The library, as well as many of the records of the survey, were destroyed by direct bomb hits and fire in an air raid on Southampton, its former home, during the early part of World War II.

Eduard Imhof's textbook on cartography, *Gelande und Karte*, became available in the United States in 1951. It was published in Switzerland late in 1950 and dealt with cartography from a new and progressive viewpoint. It went into great detail concerning land forms, cultural patterns and their portrayal at different map scales. The book was designed around Swiss maps and the illustrations contained many beautiful examples of Swiss mapping

Another 1950 publication received in the United States during 1951 was the *Bibliographie cartographique internationale 1948*. It was compiled by experts from 12 countries under the direction of M. Foncin and P. Sommer and was published by the Comité National Français de Géographie and the International Geographic union in co-operation with the United Nations Educational, Scientific and Cultural organization.

Africa and Asia.—Three new parts of the *General Atlas of Belgian Congo* were published by the Institut Royal Colonial, Brussels, during the year. The sections, covering Catholic missions, geology and animal production, consisted of a map and an explanatory text. This made a total of eight parts of the atlas that had been issued since it was started in 1948.

The second volume of the *Historical Records of the Survey of India*, published late in 1950 by the Survey of India, were received in the U.S. in 1951. This volume, by Col. R. H. Phillimore, covered the period of 1800 to 1815 and contained a detailed account of the cartographic history of the East India company during its greatest expansion as well as data on the early trigonometric surveys of the Indian states that led to the founding of the Survey of India. Colonel Phillimore had begun the compilation of the history 17 years before, and volume one appeared in 1945. Several volumes to complete the history were in preparation.

International.—Volume one of *World Cartography* was published in June 1951 by the department of social affairs of the United Nations. The periodical was to be published annually as an international review of mapping activities. The publication is divided into four sections covering general and technical articles, bibliography and notes on current mapping activities. The 1951 issue contained articles on Canada, the United States, Brazil and the Americas in general.

Cement.

World production of cement increased from 126,325,000 short tons in 1949 to 144,954,000 tons in 1950, of which about one-third was in the United States.

United States.—The salient features of the cement industry in the United States were reported by the U.S. bureau of mines as follows:

Cement Industry in the U.S.

Both production and shipments made new record highs in 1950, and continued to increase in 1951. Production through Oct. 1951 was 205,453,000 bbl., and shipments rose to 211,517,000 bbl., against 186,693,000 bbl. and 195,520,000 bbl. in the same period of 1950. (G. A. Ro.)

Census Data, U. S.

In providing for the census of 1790, the United States became the first of the current national entities to establish a series of regular census enumerations. The first census of the United States was a relatively simple affair, however. It recorded for each household, without listing the names of the members, the number of persons in each of five categories, namely, free white males under 16 years of age, free white males 16 and over, free white females, free persons other than white, and slaves. Subsequent censuses increased the number of categories somewhat, but still required only a count for each household, and it was not until 1850 that the census taker recorded information for each individual person. This was perhaps the most important change that has so far been made in U.S. census methods—though the invention of punched-card tabulation in 1890 and the introduction of questions on a sample basis in 1940 might be close competitors.

From 1850 on, the census schedules (lists of questions) became increasingly complex, until in the 17th census, in 1950, there were 18 questions to be asked about every person, 27 additional questions to be asked of a random sample (mostly 20%) of the persons enumerated, and 31 questions (9 on a sample basis) with regard to the dwelling occupied by each family or household. Even these figures do not constitute a full measure of the complexity of the enumerator's task, at least in the rural areas, since for each farm operator there was another schedule containing numerous inquiries with regard to tenure, equipment, livestock and crops.

While these large numbers of questions, with their classifications and cross classifications, provided literally acres of published statistics (the published reports of the 1940 census of population and housing occupied 75,000 quarto pages, for the most part set in six-point type), requests for simple and purely quantitative data, such as the total population of specified areas on specified dates, were still more frequent (though not necessarily more important) than any other type of inquiry received by the census bureau.

The figures for the 1950 population of the United States, by states, were made public early in Nov. 1950, or nearly a month in advance of the date on which they were required by law, but the final population counts for cities, counties and smaller areas suffered unexpected delays, coming out slowly, state by state, over the subsequent 11 months.

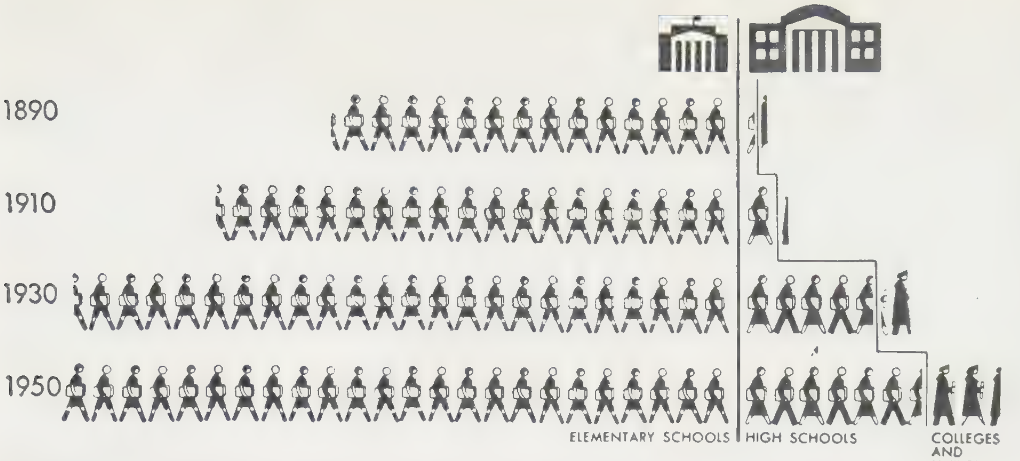
In order to give information with regard to the various characteristics of the population of the United States at the earliest possible date, a random sample comprising the returns for 150,000 persons was selected and tabulated. These sample tabulations afforded preliminary figures for the population classified by colour, sex, age, marital status, education, employment, etc., not only for the United States as a whole but also for the four principal regions and for the ten largest states. Final figures for the characteristics of the population were being made public, state by state, but as of Dec. 1951 there were no U.S. totals for characteristics (other than urban and rural) except those from the sample.

Figures from this sample tabulation are presented in Tables IV to VIII, while in Tables IX to XI are presented figures from the current monthly survey, which covers 25,000 households, or roughly half as many as the census sample just referred to. Though these samples are fairly adequate, especially with respect to U.S. totals, it should be borne in mind that the sample-based figures are all subject to a moderate sampling variability which increases with the decrease in the size of the figures concerned, and that small differences between one figure and another are even more seriously affected by this variability.

Population Growth.—The population of the United States on April 1, 1950, the date of the 17th decennial census, was 150,697,361, as compared with 131,669,275 on April 1, 1940, the date of the 16th census. The increase in population in the decade ending in 1950 thus amounted to 19,028,086 persons, or 14.5%.

Numerically, this was the largest increase attained in any census decade, though the percentage increase was smaller than that recorded in any earlier ten-year period except the period of the depression, between 1930 and 1940, during which the population increased only 7.2%.

The population in 1790, when the first census was taken, was only 3,929,214. Each subsequent census up to 1860 showed an increase of about one-third over the preceding one; from 1860 to 1910 the decennial increase was around 20% or 25%; for the next two decades, around 15% or 16%; and for the decade ending in 1940, only 7.2%, as indicated above. The much more rapid growth which took place between 1940 and 1950 represented, therefore, a reversal of a long-time trend toward slower



ENROLMENT in elementary schools, high schools and colleges, according to U.S. decennial censuses between 1890 and 1950. Each symbol represents 1,000,000 enrolled students

and slower population growth. The data from the 17 censuses are presented in Table I.

Current Estimates.—Monthly estimates of the population of the United States had been made since the 1940 census by adding each month the number of births, subtracting the number of deaths (including an allowance for underregistration of births and deaths) and adding the net civilian immigration. A precensus estimate for April 1, 1950, published in June 1950, exceeded the final census count by less than 100,000. The current estimates were later revised to make the series agree exactly with the census. The revised estimates for July 1 of each year are presented in Table II, together with the three elements on which they are based. These figures indicate significant changes in the rate of population growth within the decade and stress the persistent maintenance of unexpectedly high rates of increase beginning with the high-birth-rate year, 1947.

The average annual increase in the population of the United States between 1930 and 1940 was less than 900,000. During the fiscal year 1940–41 the increase went up to 1,281,000 and then in 1942–43 to a wartime maximum of 1,857,000. For the next three years the increase was maintained at around 1,500,000 or 1,600,000, followed by an all-time maximum of 2,743,000 in 1946–47.

In the years immediately following midyear 1947 the annual increase was maintained at a point only little below this maximum; and the year 1950–51 even showed a considerable gain over the preceding year.

Since the number of deaths in fiscal year 1950–51 was somewhat larger than four years earlier—almost enough larger to cancel the increase of 72,000 in net immigration—the main factor in the persistent maintenance of high rates of population increase was the number of births, which was nearly 6% above 1949–50 and only a little smaller in 1950–51 than in the maximum year, 1946–47, presumably showing the effect of the war activity in Korea. In fact, the number of births registered from January through September in 1951 was practically identical with the number in the same months of the peak year, 1947.

Table II.—*Estimated Total Population of Continental United States, Including Armed Forces Overseas, July 1, 1940, to July 1, 1951*

July 1, 1951†	154,318,000	2,646,000	1.74	3,836,000	1,485,000	2,352,000	294,000

*Births and deaths adjusted for underregistration.
†Preliminary figures.

Many population experts interested in forecasts for future dates had regarded the large number of births which took place in 1947 as a temporary matter, a sort of aftermath of demobilization, and rather expected that the birth rate would shortly resume the pre-World War II downward trend. The maintenance of the number of births for four years at around 3,650,000 or higher (with the possibility of a new record in calendar year 1951) afforded evidence in support of an alternative opinion, namely, that the nation might look forward to a long period of high birth rates and consequent rapid population increase.

If, to make an extreme assumption, an annual increase of 2,500,000 were maintained until 1955, the population of the United States would then stand at 164,300,000; and if the same rate continued until 1960, the total would then be about 177,000,000. One should not forget, however, that the number of persons 10 to 19 years old in 1950 was smaller by about 2,000,000 than the number in this age range in 1940; and that this was the group which was coming into the major reproductive age range in the years just ahead. In other words, without regard to current rates or happenings, the number of potential fathers and mothers would decrease by 10% or 12% in the decade 1950–60.

The sources of the increase between July 1, 1950, and July 1, 1951, may be summarized as follows: there were during this 12-month period 3,836,000 births, partly offset by 1,485,000 deaths, leaving a natural increase of 2,352,000; and the net civilian immigration amounted to 294,000.

The immigration figure, it may be noted, had increased materially during the decade, rising from around 60,000 in the years ending June 30, 1941 and 1942, to 230,000 in 1945, to 285,-

Table I.—*Census Population of Continental United States: 1790 to 1950*

*Revised figure, including estimate for underenumeration in southern states.

000 in 1948 and to figures around 300,000 or above in the remaining years of the period covered by Table II.

The estimates given in Table II represent the population of the United States including men in military service overseas, these being the figures best adapted to showing the actual and potential growth of the nation. Estimates are also made for the civilian population and for the population present in continental United States, which is the population that would be covered by a census. The estimate of the civilian population for July 1, 1951, was 151,002,000, and for the population present in the U.S., including military stationed in the states but not overseas, for the same date it was 153,307,000.

The population on Oct. 1, 1951, including military overseas, was estimated at 155,107,000.

Centre of Population.—As computed for 1950, the centre of population was located in Denver township, Richland county, Ill. about 60 mi. N.N.W. of Evansville. During the decade from 1940 to 1950 the centre of population moved 42 mi. westward and 7.6 mi. southward, reaching its most southerly as well as its most westerly point. It may be noted that, except for the state of Michigan, most of the areas of very rapid 1940–50 increase in population were in the west and the south; and the fact that the computed centre did not move farther south and west stands as evidence of the stability of the great body of the population as a whole.

Urban and Rural.—From 1910 to 1940 the urban population of the United States was defined substantially as the population living in incorporated places of 2,500 or more, with certain unincorporated places in a few states classified as urban under special rule. The urban classification was limited for the most part to incorporated places, because the unincorporated villages had no definite boundaries and therefore could not readily be enumerated separately from the remainder of the township or other civil division in which located. This definition left out of the urban classification most of the larger unincorporated places and much of the population living in the suburbs of the cities. To bring into the urban classification these two fairly important areas, two changes were made in the definition adopted for the 1950 census. First, the suburban areas around all cities of 50,000 or more (in 1940) were carefully mapped and boundaries were established for an area termed the "urban fringe." This urban fringe included of course some incorporated places already classified as urban in their own right, but it also included many thickly settled suburban areas previously classi-

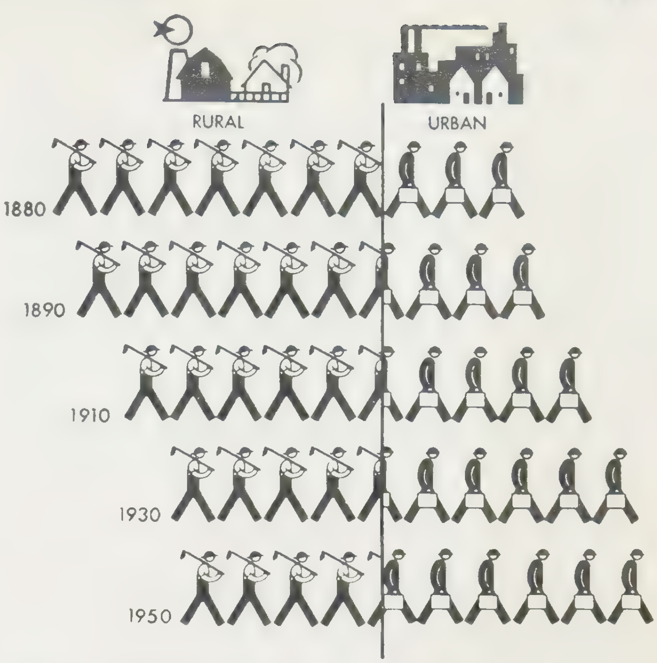
*The "old" definition is the definition that had been used, with only minor changes, from 1910 to 1940.

fied as rural. Second, arbitrary boundaries were established for a large number of unincorporated villages, so that separate counts could be made for these places and these could be classified as urban if they had 2,500 inhabitants or more, along with the incorporated places. These places, except for the few that had been counted as urban under special rule in 1940, represented a net addition to the urban area, as did likewise the previously rural parts of the urban fringes around the large cities.

In order to provide material for evaluating the effect of these changes in the definition of urban territory, the 1950 census returns were tabulated also according to the 1940 definition. The resulting figures are presented, by states, in Table III, with 1940 figures for comparison and various percentages which facilitate their analysis.

For the United States as a whole the 96,467,686 persons living in territory classified as urban under the new 1950 rules constituted 64.0% of the total population, while the 88,927,464 that would have formed the urban population under the old or 1940 rules formed only 59.0%. These percentages may be compared with the 1940 figure of 56.5% urban. The new urban population in 1950 was larger than the 1940 urban population by 29.6%, while the 1950 total under the old rule represented an increase of only 19.5%, or not so very much more than the 14.5% of increase in the total population, urban and rural combined.

It had been expected that the increase in the urban population as measured by the old rule applied to the 1950 counts would more closely represent what might be termed the actual increase in the importance of the urban area; but an analysis of the state figures presented in Table III indicates that this was probably not true, and that the new urban population not only served better for interarea comparisons of 1950 data, but was perhaps also better (certainly not much worse) for comparisons between 1940 and 1950, by reason of the fact that during the intervening decade so much of the population living under strictly urban conditions had been established in unincorporated places and especially in the previously rural parts of the urban fringes. There were 13 states (New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Ohio, Michigan, Delaware, Maryland, Oregon and California) in which the percentage urban computed under the old rule for 1950 was smaller than the 1940 percentage, and the percentage of increase in rural population classified as in 1940 was greater than the percentage of increase in urban population. Most of these states were states in which it was safe to assume that urbanization was still going on—certainly that the urban population was not becoming a less important element in the state total. In New Jersey, for example, the state which had the highest percentage urban in 1950, the increase in the urban population under the old rule was only 13.3% (as compared with 29% for the rural area), while under the new rule the urban population increased 23.3% and the rural decreased 15.2%. Similar comparisons can be made for most of the other states on the list just given, except for Massachusetts and Rhode Island, where the special-rule procedure of 1940 and earlier censuses had thrown unduly large numbers of entire towns (townships) into the urban column, so that the application of the new 1950 rules resulted in an urban population smaller than what the old rule would have given—and a percentage urban in 1950 materially lower than that of 1940. Except for these states, and three other states in which there were neither urban-fringe cities nor large unincorporated places, the urban population was appreciably larger under the new rule than it would have been if the traditional definitions had been maintained.



RURAL AND URBAN POPULATION in the U.S. based on data of decennial censuses from 1880 to 1950. Each symbol represents 10% of the population

Farm Population.—Another classification somewhat similar to that which separates urban from rural is that which divides the rural population into rural-farm and rural-nonfarm. Farm population is defined, in general terms, as comprising those persons who live on farms. The farm population enumerated in rural areas in 1950 numbered 23,368,433, leaving 30,861,242 for the rural-nonfarm. As compared with the rural-farm population reported in 1940, the 1950 figure represented a decrease of 22.7%, while the nonfarm part of the rural population registered a gain of 14.2% and the urban population a gain of 29.6% partly by reason of a somewhat more inclusive definition, which took over a part of what would have been rural-nonfarm under the old classification.

The real decrease in farm-resident population may not have been quite so great as the 22.7% just quoted would indicate, for there were some changes (presumably improvements from points of view other than that of comparability) in the definition of farm population. For one thing, the population of institutions located on farms, included in 1940, was excluded from the farm-population classification in 1950. This item, however, would not account for more than about 200,000. Another change which tended to make the 1950 definition narrower and less inclusive than that of 1940 took the form of specific instructions to the enumerators not to count as a farm family any family which paid cash rent for the house and yard only, that is, not including space for a garden or anything like that, even though the house was located on what might physically be considered a part of a farm. Doubtless many such families were excluded, even in prior censuses, before these instructions were issued, since the enumerator would often decide, on the basis of common sense, that the house lot was really no longer a part of the farm—that is, of a tract of land that was being used in the production of agricultural products. But the unexpected decrease in the farm-population returns indicated that more borderline cases were excluded as a result of the specific instruction.

The total farm population would include a small element in urban areas, though the urban-farm population was probably not more than 300,000—making a total farm population of around 23,600,000 or 23,700,000.

The figures representing urban, rural-nonfarm and rural-farm population are summarized in Table IV, which gives figures

Table IV.—*Urban, Rural-Nonfarm and Rural-Farm Population by Regions,* 1950 and 1940*

Region and date		Total	Urban†	Rural nonfarm‡	Rural farm‡
United States	1950	150,697,361	96,467,686	30,861,242	23,368,433

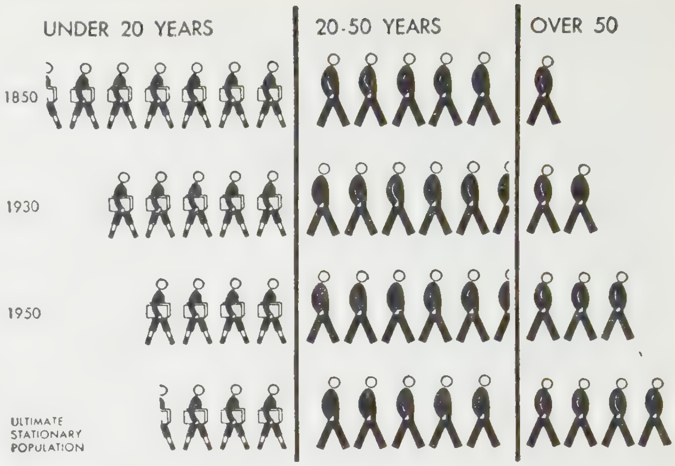
South	1950	47,197,088	22,955,762	12,233,388	12,007,938
	1940	41,665,901	15,290,483	10,031,504	16,343,914
Per cent increase		13.3	50.1	21.9	—26.5
West	1950	19,561,525	13,647,792	4,052,699	1,861,034
	1940	13,883,265	8,127,651	3,427,290	2,328,324
Per cent increase		40.9	67.9	18.2	—20.1

*The northeast comprises the New England and middle Atlantic divisions, as shown in Table III: the north central region includes the east and west north central divisions; the south, the three southern divisions; and the west, the mountain and pacific divisions.

†Final figures. The sum of the rural nonfarm and the rural farm is the final rural total.

‡Distribution of 1950 rural between nonfarm and farm based on the tabulation of a small sample.



AGING OF THE U.S. POPULATION, based on decennial censuses for the last century. Each symbol represents 8% of the population

for the four major regions into which the country is divided, as well as for the United States as a whole, with comparative data for 1940.

The decrease in the rural-farm population was greatest in the south, where the farm population declined from 16,343,914 in 1940 to 12,007,938 in 1950, or 26.5%—accompanying a decline of 11.9% in the number of farms and an increase of 50.1% in the urban population; and least in the northeast, where the decline, 13.6%, was almost exactly equal to the increase in the urban population, 13.8%, and where there was a decline of more than 17% in the number of farms.

Marital Status.—The unusual increases in the numbers of marriages and in the numbers of births which had taken place since 1940, directly or indirectly as a result of war and war conditions, played an important part in the increased rates of population growth which were in evidence especially after 1946 or 1947. The radical changes in the distribution of the population in accordance with marital status which resulted from the increased number of marriages are clearly shown in the 1950 census statistics which are presented in Table V.

The whole number of females 14 years old and over in the population increased from 50,549,176 in 1940 to 56,991,000 in 1950, or 12.7%, but during the same period the number of married women increased from 30,090,488 to 37,338,000, or 24.1%, with an actual decrease in the number of single women amounting to 16.6%. On a relative basis the percentage married in this group increased from 59.5 in 1940 to 65.5 in 1950, while the percentage single declined from 27.6 in 1940 to 20.4 in 1950.

The figures for males show similar changes, though in this case allowance has to be made for the fact that hundreds of thousands of young men were in the armed forces overseas at the time of the census and were thus not included in the count. This accounts in the main for the fact that the number of males 14 years old and over in the resident population increased only 8.6%, as compared with 12.7% for females. It also explains in part, since a large proportion of the men in military service are single, the higher percentages married shown by the census for men as compared with women. The number of married men included in the census count increased from 30,192,334, or 59.7% of the total 14 and over, in 1940 to 37,238,000, or 67.8% of the total, in 1950, while the percentage single declined from 34.8 to 26.2.

Married Couples.—There were 35,320,000 married couples returned in the 1950 census. In the case of 33,054,000 couples, or 93.6% of the total, the husband was returned as the head of the household, these couples being classified in the official reports as "with own household." The remaining 2,265,000 couples, officially classified as "without own household," were for the most part living in other households, that is, sharing a home with other persons. While not identical with the so-called doubled-up families, their number provides a good index of the number of such families. The proportions of all married couples in these two categories were about the same in 1950 as in 1940, the percentage living in other households being 6.4 in 1950 as compared with 6.8 in 1940.

As between one part of the United States and another, there were significant differences. In the northeast 8.1% of the couples were in the status of doubled-up families, as compared with 6.5% in the south, 5.5% in the north central states and 5.1% in the west.

Families.—There were 38,788,000 families in the United States in 1950. This figure was based on a new definition (new, that is, since the 1940 census) in accordance with which a family is a group of two or more persons related by blood, marriage or adoption and residing together. In 1940 the count of families included persons living alone or with no related persons in the same household—the so-called one-person families. It also omitted a considerable number of groups of related persons living in hotels, boarding houses, etc., or as subfamilies in larger households. It is estimated that there were in 1940 about 32,-

Table V.—*Marital Status of the Population 14 Years Old and Over by Sex, 1950 and 1940**

Sex and marital status	1950 Number	1950 Per cent	1940 Number	1940 Per cent	Increase 1940–50

Table VII.—*Families in the United States, Urban and Rural, by Regions, 1950**

Region	Total	Urban	Rural nonfarm	Rural farm
U.S.	38,788,000	25,467,000	7,701,000	5,621,000
Northeast	10,005,000	8,081,000	1,474,000	451,000
North central	11,804,000	7,704,000	2,201,000	1,899,000
South	11,859,000	6,090,000	2,981,000	2,788,000
West	5,120,000	3,592,000	1,045,000	483,000

*Figures based on the tabulation of a small sample.

166,000 new-definition families. In comparison with this estimate the 1950 figure represents an increase of 20.6% in the number of families, as compared with an increase of 14.5% in the population, reflecting the effect of a considerable decline in the average size of family.

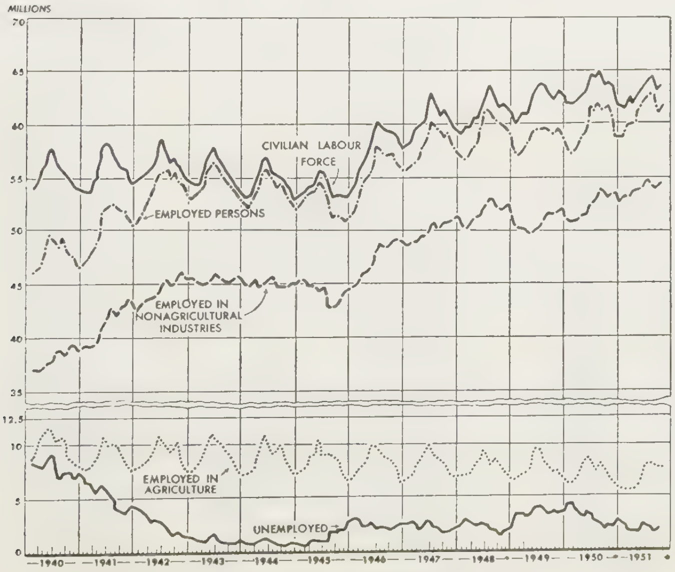
The effect of the change in the definition of a family may be summarized as follows: the new definition excluded, for 1950, about 4,000,000 household heads with no relatives in the household, who would have been classified as one-person families in 1940, and included about 400,000 groups of related persons living as subfamilies in larger households or in hotels or other quasi-households, which would for the most part have been omitted in 1940.

Table VII shows the number of families in rural and urban areas, by regions, the distribution among the various areas being of course similar to the distribution of the population, as shown in Table IV.

Family Income.—Total money income during 1949 was reported by 36,441,000 of the 38,788,000 families in the United States, in response to one of the questions on the 1950 census schedule. Of this number, 3,129,000, or 8.6%, reported a money income of less than $500, and 2,496,000, or 6.8%, reported between $500 and $999. These two groups included, however, considerable numbers of farm families whose cash income was supplemented by farm products raised for home consumption. The largest number in any one of the officially established income groups was 3,989,000, or 10.9%, in the group which reported incomes between $3,000 and $3,499. In the maximum income group, comprising families with $10,000 or more, there were 1,054,000 families, or 2.9% of the total.

The median income for all families in the United States was $3,068 and for rural and urban families, omitting most farm families, $3,245.

There were considerable differences as between one region and another in the distribution by income. In the two northern regions and in the west there were two income groups with more than 10% of the total, all above the $2,500 level, while in the south the only groups with more than 10% of the total were the three groups with income under $1,500. The median income for the west was $3,435; for the northeast, $3,362; for the north central states, $3,257; and for the south, only $2,248. Here again allowance should be made for the fact that the percentage of farm families was highest in the south—though even omitting the rural-farm areas the median for the south was only $2,622.



TRENDS in the labour force, 1940 to 1951 (Source: U.S. Bureau of the Census)

Table VIII.—*Income of Families in the United States, by Regions, 1949**

Income group	United States	Northeast	North central	South	West
Total families. . .	38,788,000	10,005,000	11,804,000	11,859,000	5,120,000

Not reporting income. .	2,348,000	827,000	685,000	622,000	214,000
Median income	$3,068	$3,362	$3,257	$2,248	$3,435

*The figures, which represent total money income during the calendar year 1949, are based on the tabulation of a small sample.

For nonwhite families in the United States, the median money income was only $1,426, and for nonwhite families in urban and rural-nonfarm areas alone, omitting the rural-farm families, $1,658.

In the south the median for all nonwhite families was $1,168, and for nonwhite families, even omitting those in rural farm areas, only $1,389.

Employment and Unemployment.—Estimates of the number of persons in the civilian labour force, the number employed and unemployed, etc., had been published each month since 1940 on the basis of a sample survey covering about 25,000 representative households. For the purpose of these statistics a person who did any work for pay or profit during the week preceding the inquiry or who had a job from which he was temporarily absent was counted as employed; and a person who was seeking work, using the term in a rather broad sense, was counted as unemployed. The employed and the unemployed, taken together, constituted the labour force.

These figures are summarized for the months of Nov. 1951 and 1950, in Table IX.

The civilian labour force decreased slightly from 63,512,000 in Nov. 1950 to 63,164,000 in Nov. 1951, or 0.5%, the decrease being somewhat more than the decrease in the civilian population which resulted from inductions into the armed forces. The number of persons employed nevertheless increased from 61,271,000 to 61,336,000, or 0.1%, while the number of unemployed continued the decrease which had been under way since 1951, dropping from 2,240,000 in Nov. 1950 to a record low of 1,578,000 in Aug. 1951 (a month of high employment in agriculture), from which point there were slight changes from month to

month, with 1,828,000 in Nov. 1951, this figure being 18.4% below the level of Nov. 1950.

The changes in the several elements in the labour force for the entire period from 1940 to Nov. 1951 are presented in graphic form in the chart on page 153.

Part-Time Workers.—The extent to which the nation's work is done by part-time workers was set forth in specific terms in the report of a survey made by the bureau of the census in Jan. 1951, covering (by representative sample) all persons who worked at any time during the year 1950, then just closed. The whole number of such persons included 7,361,000 persons who were neither at work nor seeking work at the time of the survey. The returns from this survey are summarized in Table X.

In all, nearly 19,000,000 persons who worked at some time in 1950 reported either that they usually worked only part time (that is, less than 35 hr. a week), or if they worked full time that they did so for half a year or less. These part-time workers, who were mainly women and school-age persons, represented about 27% of all persons with work experience in 1950.

In Table X the 68,876,000 persons who at some time during 1950 worked for pay or profit or without pay on a family-operated farm or in a family-operated business are classified into three broad categories. Those who worked 50 weeks or more at full-time jobs (35 hr. a week or more) were designated "year-round full-time workers." Those who worked primarily at part-time jobs (less than 35 hr. a week) or at full-time jobs for 26 weeks or less were designated "part-time or intermittent workers." Those who worked between 27 and 49 weeks at full-time jobs were designated "part-year full-time workers."

The 38,375,000 year-round full-time workers included 8,592,000 women, this group forming 36.8% of all women who worked during 1950, as compared with 65.4% for the men.

Of the 18,708,000 part-time or intermittent workers, on the other hand, 10,588,000, or more than 56%, were women; and this group formed 45.3% of all women who reported work experience (but only 17.8% of the men). Of these 10,588,000 part-time or intermittent female workers, 6,211,000, or nearly 60%, worked at part-time jobs, while the remainder worked at full-time jobs for less than 27 weeks during the year. The proportion of male workers in this class who were employed at part-time jobs was slightly less, about 55%.

The classification of the survey returns by occupation indicated, as one might expect, that occupations which require relatively little training or which are subject to strong seasonal variations depend heavily on part-time or intermittent workers as a source of labour supply. Among persons, for example, whose longest job in 1950 was in private household work, two-thirds worked only on a part-time or intermittent basis, and likewise with farm labourers. Trade and service establishments, partly because of the irregular or seasonal variations in their activities, meet a far larger part of their labour requirements through the employment of part-time or intermittent workers than do manufacturing and other nonfarm industries—such workers forming about one-third of those who had worked in trade and service industries in 1950, as against one-fifth in other nonfarm industries.

Work Experience by Age and Sex.—More than 63% of the civilian population 14 years old and over in Jan. 1951 had worked at some time during 1950, including 86.8% of the males and 41.1% of the females. These figures are distributed by age and into the three major work-groups defined earlier, in Table XI.

In addition to the fact just stated, that the proportion of men who worked was decidedly higher than the proportion of women, the figures indicate that a much larger proportion of men who worked were employed full-time year-round—65.4% as compared with 36.8% for the women. Conversely, only 17.8% of the men worked part-time or intermittently, as compared with 45.3% of the women workers. And, referring to the age classification, it may be noted that male part-time workers were important only in the age groups between 14 and 24 years old and among men 65 and over, whereas part-time workers formed 35.8% of the female workers even in the age group (20–24 years) where they formed the smallest proportion of all workers.

The general average of 86.8% of the male population 14 and over with work experience in 1950 represents the merging of much lower percentages for the younger and the older age groups with percentages around 97 or above for men from 25 to 54 years

Table XI.—*Work Experience in 1950 of Persons 14 Years Old and Over in the Civilian Noninstitutional Population of the United States in Jan. 1951, by Age and Sex**

*Labour force figures based on a small sample.
†Worked 50 weeks or more at full-time jobs.
‡Worked 27 to 49 weeks at full-time jobs.
§Worked at part-time jobs, or at full-time jobs for 26 weeks or less.

of age. The proportion of the workers who were in the full-time year-round class was likewise higher for the middle age-range men, running more than 70% for all men from 25 to 64 years of age. Conversely, few of the men from 25 to 54 were in the part-time class.

In the female population the proportion who worked in 1950 was highest (61.1%) in the group 18 to 19 years old. Instead of increasing with increasing age, this percentage fell off to 58.7 in the 20–24 years age group and still further to 43.7% in the 25–34 years group, as increasing numbers of women were married and acquired families. After age 35 there was some increase in the percentage who worked, followed by a decline after age 55, with a very low percentage at 65 and over—11.8% as compared with 49.3% for men in this final age group. Roughly, the percentage in the full-time group followed the trend of the percentage of work participation, as with the men, but for most of the age groups the percentage of part-time workers exceeded that of full-time workers.

Places of 5,000 or More.—Table XII gives the 1950 population of all places of 5,000 inhabitants or more, including unincorporated places as well as incorporated, with 1940 figures for comparison. The 1950 figures represent the final revision of the census count for these areas. (*See* also ALIENS; BIRTH STATISTICS; EMPLOYMENT; HOUSING; MARRIAGE AND DIVORCE; WAGES AND HOURS; WEALTH AND INCOME, DISTRIBUTION OF.)

*Unincorporated place; in some cases part of a minor civil division of the same name.

†Incorporated place, excluding part of civil division of the same name.

‡Not enumerated separately in 1940.

Ceramic Products. By the end of 1951, the volume of building construction in the United States had exceeded that of the previous year, providing peak markets for structural clay products, sanitary ware, enamelled kitchenware and structural and window glass.

Though the shortages of such materials as cobalt, copper and soda ash were felt severely by manufacturers in some phases of the ceramic industry, they were beginning to look for, and find, substitutes.

The U.S. steel industry, outdoing itself in production, could not keep up with demand in the industry, particularly in the special steels for enamelling.

As a whole, the U.S. pottery industry suffered a severe slump. Dinnerware imports from other countries, particularly Japan, were cutting into the home market. The industry shipped substantially less in 1951 than in the previous year.

In the china, glass and giftware fields, the United States threw a spotlight on Italian, French, Swedish and west German merchandise by making major tariff concessions at the Torquay (Eng.) conference. In return, the U.S. received tariff cessions for its own manufacturers.

At trade shows the trend seemed to be toward casual ware, with modernized forms of traditional items in the lead. The shortage of pieces made of critical materials such as copper, brass and certain types of steel was minimized by the ingenious use of ceramic substitutes. These included enamelled silver, pottery and glass.

Pottery and glass buyers in Great Britain reported a flood of glassware for their home market, but a continuing dearth of quality tableware. The greatest demand on the British market was for decorated tableware, but the prospects for delivery were not promising.

The continuing popularity of the "picture" window in the modern home and the trend toward greater window-glass area in automobiles contributed to the need for more flat glass. The steel shortage probably accounted for the fact that the glass-container industry produced approximately one-fifth more pieces than during 1950.

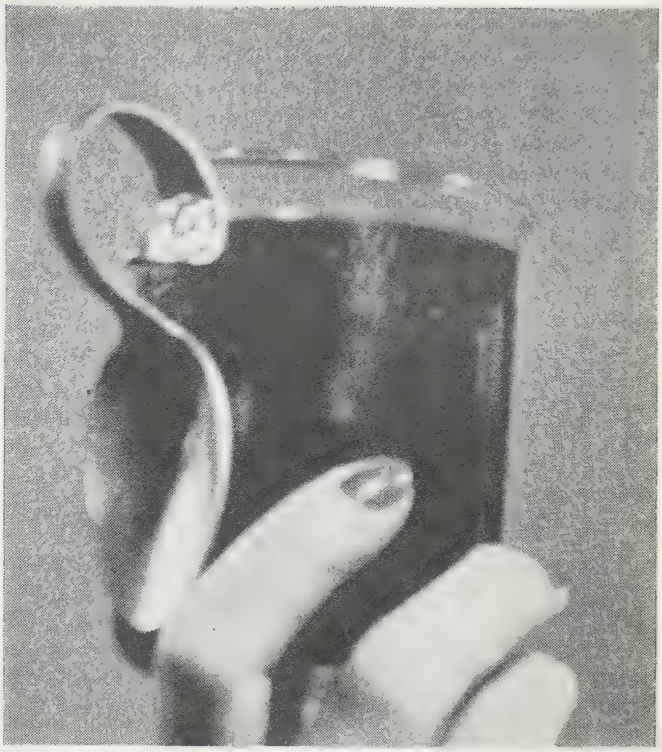
(*See* also GLASS.)

Blocking some manufacturers' plans for greater production in the glass industry was a government ban on the production of tubes for colour television, again to conserve critically short materials needed for armament.

Glass production figures showed that production in most phases of the west German glass industry was as high as in the whole of Germany before the war.

Art and high-quality glass accounted for a substantial share of the exports.

New Developments.—In line with the defense program, ceramic materials began finding their way into the construction of military goods and weapons. An outstanding example was the use of heat-resistant ceramic coatings in the exhaust systems of U.S. jet aircraft. The coatings provided "header" sections with improved protection from the violent heat of gases produced in the jets.



SPOON SOLDERED to a glass by a process for direct joining of glass or ceramics to metal. The process was developed by engineers of the General Electric company in 1951

Designers of power-type capacitors and condensers for electronic equipment and radio and television receivers were finding new uses for an extremely fine glass fibre which was being manufactured. Equipment made of the fibre had lower electrical loss, greater high-temperature stability and greater capacity per unit of weight and size than those made previously. The fibre was said to be smaller in diameter than any glass fibres before manufactured on a commercial basis.

A program advocating the use of porcelain enamelled curtain walls (thin, sandwich-type walls having an inner and outer facing of metal with an insulating core between) was instituted in the United States. The fact that colour can be used to a great competitive advantage in porcelain promised to make these walls superior to aluminum, stainless steel and glass walls.

Porcelain enamelling of aluminum, commercially begun in 1950 but with limited success, was still in the perfecting stage.

For the automotive industry, a graduated glare-reducing glass was developed and put on the market. Stained a deep blue-green at the top to screen out the sun's glare and unwanted heat rays, the glass eliminated the need for sun shields.

In the field of television tube manufacturing, large 26-in. mirror blanks were manufactured. Installed in a reflective optical system, a blank provided pictures large enough to cover an average-size theatre screen.

A process was conceived by which glass could be soldered to metal, making a bond stronger than the glass itself. The method, it was found, could also be used to solder metal to ceramics and carbon.

A device for supplying low-level lighting, called Electroluminescence, was put on the market. The new-type light had a coating which glowed when electricity was applied.

A kind of glass was introduced which could be precision machined by using ultra-violet light, heat and hydrofluoric acid to form intricately cut patterns of any desired shape and depth. The "chemically machined" glass was being used in the manufacture of "printed" electronic circuits.

The functional rather than the decorative was again the keynote in the field of ceramic art.

Films of 1951.—*Simple Ceramics, The Potter's Wheel* (Allen-Moore Productions). (C. S. Pe.)

Ceylon. A self-governing member of the Commonwealth of Nations, Ceylon lies southeast of the southern extremity of India. Area: 25,332 sq.mi. Pop.: (1946 census) 6,695,605; (Dec. 1950 est.) 7,639,000. Language: mainly Sinhalese (69%) and Tamil (21%). Religion: Buddhist (61%), Hindu (22%), Moslem (9%) and Christian, mainly Roman Catholic (7%). Chief towns (pop. 1946 census): Colombo (cap., 362,000); Jaffna (63,000); Dehiwala-Mt. Lavinia (56.000); Kandy (52,000).

Governor general, Lord Soulbury; prime minister, Don Stephen Senanayake.

History.—The Port of Colombo Administration act, which came into force on Jan. 1, 1951, gave the Colombo Port commission a Ceylonese majority among the nonofficial members for the first time. The increase in the number of Ceylonese employed in commerce and industry engaged the government's attention. A. E. Goonesinha, minister in charge of what was termed "ceylonization," told the house of representatives that more Ceylonese should be employed in the higher posts on estates and in commercial firms and banking institutions. The planting industry was sympathetic but contended that many years of practical experience were required before proficiency in all branches of planting was reached. The criterion should be efficiency, not nationality. The percentage of Ceylonese superintendents to Europeans in the planting industry within the last 12 years had increased from 10% to 19%, and Ceylonese assistant superintendents to Europeans from 10% to 40%.

The budget presented on July 13 showed an estimated revenue for 1951–52 of Rs. 971,000,000 and expenditure Rs. 1,244,000,000. Of this expenditure Rs. 910,000,000 was to be provided from the consolidated fund and the balance, Rs. 330,000,000, from the loan fund. The budget was the largest in the history of Ceylon. The main items of revenue were estimated to be: customs Rs. 553,000,000; income tax, estate duty, excess-profits tax Rs. 202,000,000; railways Rs. 65,000,000; excise and salt Rs. 46,000,000. The chief items of expenditure were estimated to be: food and co-operative undertakings Rs. 176,000,000; health and local government Rs. 131,000,000; education Rs. 140,000,000; agriculture and lands Rs. 79,000,000; labour and social services Rs. 24,000,000.

The total expenditure on defense was estimated at Rs. 22,000,000 as against Rs. 9,000,000 for 1950–51.

The budget provided for an increase in the profits tax from 20% to 25%, and for increases in income tax on incomes of more than Rs. 20,000 a year, ranging from 22% to 24% in the Rs. 20,000 income group and from 66% to 76% at the other end of the scale. Increased family allowances were granted to the middle- and lower-income groups. The tax payable by resident companies was increased from 28% to 38%, and by nonresident companies from 24% to 36%. There was a reduction of import duties on certain consumer goods and on capital goods such as motor vehicles. A sliding scale for export duties on rubber and coconuts took effect from Sept. 10. Reliefs to industry, including exemption from taxation for the first three years on investment in government-sponsored corporations and taxation only on profits exceeding 5% for the first three years on defined industrial undertakings, started after April 1, 1951.

Exchange controls were relaxed from Sept. 19, and travel rations increased.

A trade agreement between Ceylon and Pakistan was signed in Karachi, Pak., on Sept. 14, coming into force retrospectively from July 1, 1951. From Pakistan Ceylon was to receive foodstuffs, bone meal, manure, ash and sulphuric acid. Ceylon was to supply Pakistan mainly with copra and coconut oil. On June 9 the prime minister informed a deputation of Ceylonese rubber producers that Ceylon would continue to be a free market for all buyers. This emphasized Ceylon's decision not to cut off supplies of rubber to China, a decision which was recognized, despite certain criticisms, as in conformity with Ceylon's economic requirements. Radio Ceylon was supplied with radio equipment in return for facilities to broadcast "Voice of America" programs as a result of an agreement concluded with the U.S. government on May 14.

Prime Minister Senanayake attended the Conference of Commonwealth Prime Ministers in London in January. On July 12 S. W. R. D. Bandaranaike, minister of health, resigned because of a difference of opinion with the cabinet. The prime minister took over the health portfolio pending further arrangements. J. R. Jayewardene, minister of finance, led the Ceylon delegation at the Japanese Peace conference (*q.v.*) at San Francisco, Calif., and signed the peace treaty on behalf of Ceylon. (E. Hd.)

Education.—Schools (1949): Sinhalese and Tamil government and assisted 5,610, pupils 1,010,184; central and English 631, pupils 237,678. Technical college (1949–50): students 1,969. Teachers' training colleges (1949) 20, students: primary 1,653, secondary 222, postgraduate 68. University (1949–50): students 1,850.

Finance and Banking.—Budget (1950–51 est.): revenue Rs. 794,000,000, expenditure Rs. 704,000,000. Gross national debt (Sept. 1950): Rs. 561,400,000. Currency circulation (Aug. 1951): Rs. 362,000,000. Bank deposits (July 1951): Rs. 637,000,000. Monetary unit: rupee, with an exchange rate of Rs. 13.33 to the pound and Rs. 4.775 to the U.S. dollar.

Foreign Trade.—(1950) Imports Rs. 1,164,000,000; exports Rs. 1,560,000,000. Main sources of imports: U.K. 20%; Burma 20%; India 16%; Australia 7%. Main destinations of domestic exports: U.K. 24%; U.S. 22%; Australia 8%; Canada 6%. Main imports: rice, cotton piece goods and sugar. Main exports: tea, rubber and coconut oil.

Transport and Communications.—Roads (1949): 6,535 mi. Licensed motor vehicles (Dec. 1950): cars 32,500; commercial 14,800. Railways (1949): 896 mi.; passengers (1949) 26,700,000; freight (1949–50) 1,350,000 metric tons. Air transport (1950): passenger-miles 6,152,000; cargo, ton-miles 73,000. Telephones (1949): 14,884. Radio receiving set licences (1950): 28,000.

Agriculture.—Main crops (metric tons): tea (1950) 138,900; rice, paddy (1949) 295,000; cassava (1948) 150,000; sweet potatoes and yams (1948) 52,000; millet (1948) 10,000. Copra exports (1950) 21,000 metric tons. Livestock (Dec. 1949): cattle 1,249,000; sheep 57,000; pigs 104,000; buffaloes (Dec. 1948) 658,000; goats (May 1950) 370,000. Coconut oil exports (1950) 77,000 metric tons, (1951 est.) 112,000 metric tons.

Industry.—Fuel and power: manufactured gas (1950) 9,000,000 cu.m.; electricity (1950) 81,000,000 kw.hr. Raw materials (metric tons): rubber (1950) 115,302; graphite (exports, 1949) 12,434; salt (1949) 28,775.

Chapman, Oscar Littleton (1896–), U.S. secretary of the interior, was born on Oct. 22 in Omega, Va., and graduated from Randolph-Macon academy in Bedford, Va. He served in the navy in World War I and studied at the University of Denver, Colo., the University of New Mexico, Albuquerque, and at Westminster law school in Denver, where he received a law degree in 1929. He was chairman of the Colorado Child Welfare committee and later president of the Colorado state board of control. In May 1933 he was appointed assistant secretary of the interior. He was a member of Pres. F. D. Roosevelt's so-called "little cabinet," and for a dozen years supervised at one time or another virtually all the interior department activities. In Dec. 1949 he became secretary of the interior. In Feb. 1951 he announced the resignation of the director of the national park service, Newton B. Drury, who had four years until retirement. Drury said Chapman forced him out; he had opposed Chapman's plan to build hydroelectric and irrigation dams in Dinosaur National Monument in Utah and Colorado. In July, to offset the possible loss of production from the Iranian oil fields, Secretary Chapman set up a Foreign Petroleum Supply commission representing 19 oil companies doing overseas business, charged with making plans to increase crude oil production and refining and to improve transportation.

Chemistry.

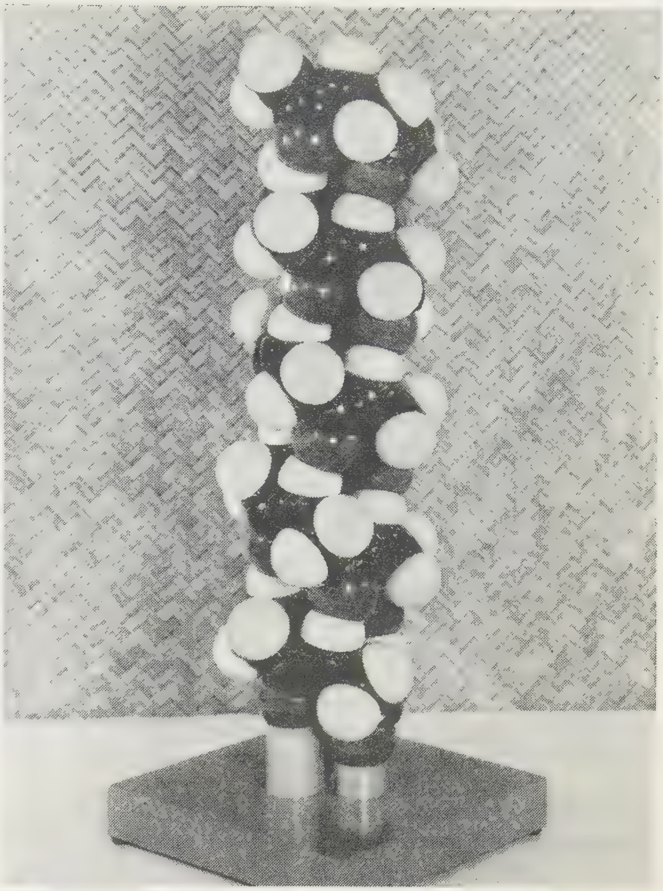
Names of Elements.—At its 1951 meeting the International Union of Pure and Applied Chemistry adopted W as the symbol for wolfram but reinstated the name tungsten as an acceptable synonym. Elements 97 and 98 were named berkelium (Bk) and californium (Cf), respectively.

Hydrogen Isotopes.—The three hydrogen isotopes of atomic weights 1, 2 and 3 are named hydrogen, deuterium and tritium. The availability of 15 c.c. of tritium gas from the reaction of neutrons on lithium of atomic weight 6 made it possible for E. R. Grilly of Los Alamos Scientific laboratory (N.Mex.) to determine vapour pressures of the three isotopes in the temperature range of 14–29° K., using baths of liquid hydrogen (14–24.5° K.) or of liquid neon (24.6–29° K.). The pressure of one atmosphere or 760 mm. of mercury was attained by hydrogen at 20.39° K., deuterium at 23.67° K. and tritium at 25.04° K. At temperature 18.7° K. solid deuterium had a pressure of 127 mm., whereas at 18.9° K. it melted and showed a pressure of 137 mm. At 27.7° K. the pressure was 2,130 mm., about three atmospheres. These are the corresponding data for tritium: solid at 20.5° K., 158 mm.; liquid at 20.6° K., 163 mm., and at 27.2° K., 1,350 mm.

Hydrides of Boron.—Diborane may be prepared by reaction of boron fluoride etherate with lithium hydride: $2BF_3+6LiH \rightarrow B_2H_6+6LiF$. Comparison with ethane, C_2H_6, is inevitable, and there is resemblance in physical properties (diborane, m.p. −165° C., b.p. −92° C.; ethane, m.p. −172° C., b.p. −84° C.), but there are great differences in chemical behaviour. For example, diborane reacts rapidly with water, yielding boric acid and hydrogen. The electron deficiency of diborane is responsible for this reactivity, since carbon has four valence electrons and boron only three. For this reason chemists had long been interested in the structure of boron hydrides. The year 1951 saw major advances on this problem.

Electron diffraction methods were employed by Kenneth W. Hedberg and Verner Schomaker of the California Institute of Technology (Pasadena). Their data eliminated any possibility of the ethanelike model for diborane but confirmed the "bridge model." In the latter the two boron atoms do not hold each other but each is associated with four hydrogen atoms in a tetrahedral arrangement. Thus two of these six hydrogens furnish a hydrogen bridge between the borons as they are held jointly by both boron atoms. The B-H bond distance was measured and found to be 1.19 A, the B-H bridge 1.33 A and the separation of boron atoms 1.77 A. The H-B-H bond angle was 121°. Comparable values for ethane are these: C-H 1.11 A, C-C bond distance 1.54 A, C-C-H bond angle 110°.

At temperatures around 200° C. or below, diborane undergoes pyrolysis into other boron hydrides, especially pentaborane, B_5H_9. The presence of hydrogen seems to assist in giving better conversions. The above work was reported by Lewis V. McCarty and Philip A. Di Giorgio of the General Electric Co. (Schenectady, N.Y.). The kinetics of this pyrolysis were studied by Robert N. Pease of Princeton university (Princeton, N.J.). The reaction was believed to be a radical-type polymerization process complicated by quasi-reversible dehydrogenation.



MODEL showing the fundamental structure of protein molecules of the alpha keratin type (hair, horn, muscle, etc.) as proposed in 1951 by Linus Pauling and Robert B. Corey of the California Institute of Technology, Pasadena

The structure of pentaborane was investigated by V. Schomaker, who used electron diffraction methods, and by W. J. Dulmage and William N. Lipscomb, Jr., of the University of Minnesota (Minneapolis), who used X-ray diffraction methods. In this compound the five boron atoms were found to be attached to each other as at the corners of a pyramid. The B-B distances at the base were 1.77–1.80 A, and the B-B distances on the edges of the pyramid were 1.66–1.70 A. A hydrogen bridge also connected each B-B pair at the base, these B-H distances being 1.35 A. The other B-H bonds (one for each boron atom) were 1.20 A long. Pentaborane, a liquid of b.p. 65° C., is one of the most stable hydrides of boron. It is not spontaneously inflammable in air, and it is not completely hydrolyzed by water even in three days at 90° C.

Plutonium.—Glenn T. Seaborg (*q.v.*) and M. L. Perlman discovered naturally occurring plutonium in 1942 in a sample of Canadian pitchblende concentrate. Seaborg, a Nobel prize medallist for 1951, continued these studies at the University of California, Berkeley. He reported that plutonium, element 94, was isolated from three pitchblende ores (from Canada, the Congo and Colorado), two monazite ores (from Brazil and North Carolina), a Colorado fergusonite and a Colorado carnotite. In the pitchblende and monazite ores the uranium content varied from 50% to 0.24% but the Pu:U ratio was fairly constant at about 10^{-11}. The fergusonite ore (0.25% U) and the carnotite (10% U) contained a substantially smaller plutonium ratio. All the plutonium was of atomic weight 239, probably formed from the U^{238} in the ore through captured neutrons and emission of beta particles: $U^{238} + n \rightarrow U^{239} \xrightarrow{-\beta} Np^{239} \xrightarrow{-\beta} Pu^{239}$.

The neutrons available for capture would be those emitted during spontaneous fission of uranium, those resulting from the action of alpha particles on the near-by light elements and those from cosmic rays.

D. F. Peppard and collaborators of Argonne National laboratory, Chicago, Ill., also reported on studies of a similar nature.

Americium.—Element 95, americium, was discovered in 1946 by G. T. Seaborg, R. James and L. Morgan. It arose from plutonium, irradiated in the chain reacting pile: $Pu^{239} \xrightarrow{n,\gamma} Pu^{240} \xrightarrow{n,\gamma} Pu^{241} \xrightarrow{-\beta} Am^{241}$. Burris B. Cunningham (University of California, Berkeley) first isolated a few micrograms of the pure element in 1949. Two groups of workers studied its chemistry in 1951.

Sherman Fried of Argonne National laboratory prepared the halides, AmF_3, $AmCl_3$, $AmBr_3$, AmI_3, and the sulphide, Am_2S_3, all in the III oxidation state. One compound in the IV state was the black dioxide, AmO_2, which was prepared by igniting the nitrate or hydroxide to 1,000° C. The trichloride was prepared by action of carbon tetrachloride on the dioxide at 900° C.: $AmO_2 + 2CCl_4 \rightarrow AmCl_3 + 2COCl_2 + \frac{1}{2}Cl_2$.

E. F. Westrum, Jr., and L. Eyring also prepared americium trifluoride from the dioxide but they used hydrogen fluoride and a little hydrogen at 650° C. From the fluoride they prepared the element by heating with metallic barium at 1,100° C. Metallic americium is silvery, very malleable and ductile. Its density was 11.7, much less than that of uranium (18.7).

Curium.—First isolation of curium, element number 96, in microgram quantity from neutron-irradiated americium was described by L. B. Werner and I. Perlman of California. Separation from unchanged americium was by means of an ion exchange resin.

Benzene from Petroleum.—Until very recent years the only commercial source of benzene, toluene and xylene was coal tar. Toluene emerged from this category during the World War II years and benzene and xylene emerged during 1951. The new source was petroleum.

In the U.S. coal tar is capable of giving about 175,000,000 gal. of benzene annually, which is used largely in motor fuel. Large increased demands for benzene as a raw material were brought about by present-day production of aniline, phenol, nylon, synthetic detergents and styrene. The last of these represented the biggest increase, because of its use in polystyrene plastic and as an ingredient with butadiene in synthetic rubber. The estimated 1951 U.S. production of benzene was 225,000,000 gal. and higher requirements were predicted.

To obtain this additional benzene, petroleum refiners separate the appropriate cyclohexane or methylcyclopentane (naphthenes) fraction from crude oil and treat it at 850–1,000° F. (455–535° C.) and 200–700 lb. per square inch pressure with an appropriate catalyst for the dehydrogenation. The benzene recovery from unchanged naphthenes essentially makes use of its greater solubility (as in diethylene glycol or liquid sulphur dioxide or by extractive distillation or azeotropic distillation) or of its greater adsorbability as on activated silica. The catalysts used may be platinum or heavy metal oxides on carriers such as molybdena-on-alumina.

Toluene also continues to be made from petroleum, and it is interesting to note that toluene was during 1951 a cheaper chemical than benzene. Coal tar productivity in the U.S. at that time was about 35,000,000 gal. to 40,000,000 gal. per year. Petroleum contributed more than twice that amount.

Xylene (about 10,000,000 gal. per year from coal in the U.S.) also was a new petroleum product. The 1951 U.S. output from the latter source was estimated at 50,000,000 gal. to 60,000,000 gal. The year also saw a new development in coal technology. Union Carbide and Carbon Corp. announced that it was hydrogenating 300 tons of coal per day for a daily output of about 500 bbl. of liquid product. This, therefore, provided a new source of hydrocarbon raw materials.

Somewhat related was a new phenol process announced by the Barrett division of Allied Chemical and Dye Corp. for use in its new Philadelphia, Pa., plant. In this process benzene and propylene were caused to react to form isopropylbenzene. The latter was then oxidized to phenol and acetone.

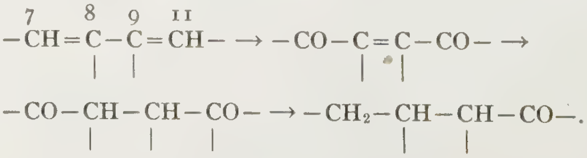
Protein Structure.—2,4-Dinitrofluorobenzene was developed by F. Sanger of Cambridge, Eng., as a reagent to detect free amino groups in proteins. During 1951 he established with its aid that bovine insulin has four free amino groups per molecule, assuming a molecular weight of 12000. This points to four open peptide chains in insulin. Two of the amino groups are on glycine and two on phenylalanine residues. The polypeptide consists of four peptide chains joined by six S-S bridges of cystine residues.

Performic acid oxidation of the dinitrophenyl derivative caused cleavage at the S-S bonds into an acidic fraction and a basic fraction. The latter was studied by methods of partial hydrolysis to a point where Sanger could list the sequence of the 30 amino acid residues comprising it. The order of the last ten was: histidine, serine, glycine, cystine, leucine, histidine, glutamic acid, aspartic acid, valine and phenylalanine.

Sanger believed that any particular protein had a very definite structure with a strict sequence of amino acid residues and that differences among proteins were due to differences in this sequence.

Cortisone.—As would be expected from the medical interest in this steroid, an intensive effort was made in several laboratories for new and simpler syntheses. The difficulty was the insertion of an oxygen at the 11-position, for such an oxygen is missing from the available starting materials such as cholesterol, cholic acid, diosgenin, etc. Some successful advances were reported.

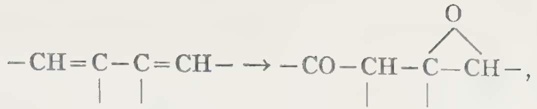
Max Tishler and collaborators of Merck & Co., Inc. (Rahway, N.J.), were successful in making 11-keto steroids starting with ergosterol. The unsaturation between carbons 5,6 was the point of attack for the synthesis, but several steps were involved. A Harvard university group under Louis F. Fieser accomplished this objective also, starting with cholesterol. This compound has one double bond only, between atoms 5,6. The immediate problem was how to remove it and get two double bonds at 7,8 and 9,11. To do this, cholesteryl acetate was oxidized (by chromic acid) to the 7-hydroxy compound, the latter esterified and pyrolyzed thereby placing two double bonds in the molecule, at 5,6 and 7,8. The double bond at 5,6 was saturated by hydrogenation in the presence of nickel catalyst. Then, by dehydrogenation with mercuric acetate, cholestadienol was obtained with two double bonds in the desired positions. Oxidation (by sodium dichromate and acetic acid), reduction (by zinc and acetic acid) and further reduction with hydrazine by the Wolff-Kishner method left carbon 11 with the oxygen which would be necessary in a cortisone structure. These steps are exhibited to show the transformations on atoms 7,8,9,11:



$$-\overset{7}{\mathrm{CH}}=\underset{|}{\overset{8}{\mathrm{C}}}-\underset{|}{\overset{9}{\mathrm{C}}}=\overset{11}{\mathrm{CH}}- \longrightarrow -\mathrm{CO}-\underset{|}{\mathrm{C}}=\underset{|}{\mathrm{C}}-\mathrm{CO}- \longrightarrow$$

$$-\mathrm{CO}-\underset{|}{\mathrm{CH}}-\underset{|}{\mathrm{CH}}-\underset{|}{\mathrm{CO}}- \longrightarrow -\mathrm{CH_2}-\underset{|}{\mathrm{CH}}-\underset{|}{\mathrm{CH}}-\mathrm{CO}-.$$

Carl Djerassi, G. Rosenkranz and co-workers at Syntex, Mexico City, Mex., provided another means of accomplishing this end. Starting with the 7,8:9,11 diene they used performic acid to oxidize it directly:



then by treatment with alkali into

$$-CO-C=C-CHOH-.$$

Then hydrogenation and Wolff-Kishner reduction yielded the sequence

$$-CH_2-CH-CH-CHOH-$$

from which

$$-CH_2-CH-CH-CO-$$

was obtained directly by oxidation with chromic acid.

The Syntex chemists announced a 22-step process for the manufacture of cortisone from diosgenin of Mexican yam, *Dioscorea.* Diosgenin is the most abundant steroidal sapogenin. It has unsaturation between carbons 5,6 as in cholesterol and differs from cholesterol in the structure at C_{17} and beyond. The company was, at the close of the year, processing 500 tons of yams per month for this purpose.

Other laboratories which reported important contributions to this problem were those of R. B. Woodward (Harvard university), Robert H. Levin (Upjohn company, Kalamazoo, Mich.), Percy L. Julian (Glidden company, Chicago, Ill.), Lew H. Sarett, Jr. (Merck & Co., Inc.), R. B. Wagner (Pennsylvania State college, State College, Pa.).

Eight-Membered Ring Compounds.—The availability of cyclo-octatetraene by synthesis from acetylene ($4C_2H_2 \rightarrow C_8H_8$) stimulated many investigations on it and its analogues. Much of this work was done by Arthur C. Cope of the Massachusetts Institute of Technology (Cambridge). Cope and H. C. Campbell found that acetylene and substituted acetylenes could be made to copolymerize to form substituted cyclo-octatrienes. Thus, dimethylacetylene and acetylene heated in tetrahydrofuran solvent at 70–90° C. and 250–300 lb. per square inch in the presence of nickel acetylacetonate and calcium carbide yielded 1,2-dimethylcyclo-octatetraene. Similarly, phenylacetylene was converted into phenyloctatetraene.

In its chemical reactions, Cope found that phenylmagnesium bromide reacted with cyclo-octatetraene at 100° C. to yield biphenyl and cyclo-octatrienes. Phenylsodium or phenyllithium gave rise to phenylcyclo-octatetraene, phenylcyclo-octatriene and cyclo-octatrienes. E. R. Lippincott and Richard C. Lord, also of the Massachusetts Institute of Technology, obtained various thermodynamic functions of cyclo-octatetraene such as entropy, heat capacity, heat of formation and the like.

Dibenzocyclo-octatetraene also was studied by Cope and S. W. Fenton. This hydrocarbon is like anthracene in being tricyclic but differs in that the middle ring is eight-membered rather than six. A tetrahydro derivative of this compound was obtained by hydrogenation with palladium as catalyst. This compound brominated readily when treated with N-bromosuccinimide. The compound obtained, 3,7-dibromo-1,2:5,6-dibenzocyclo-octadiene, underwent an unusual reaction in dehydrobromination by amines. Instead of regenerating dibenzocyclo-octatetraene, the central eight-membered ring underwent contraction to a seven-membered ring with a methylene side chain; namely, 7-methylene-1,2:5,6-dibenzocycloheptatriene.

1,8-Tetramethylenenaphthalene and Related Compounds.—The three radicals, CH_3, CH_2, CH, bear the names methyl, methylene and methylidyne, respectively. From this, $-CH_2CH_2CH_2CH_2-$ is the tetramethylene radical and $-CH=CH-CH=CH-$ the tetramethylidyne radical.

If the tetramethylidyne radical were substituted across the 1,8-positions of naphthalene, a new seven-membered ring would result. This hydrocarbon had never been made, but the analogous one from acenaphthene was prepared and studied by Virgil C. Boekelheide of the University of Rochester (N.Y.). In acenaphthene, the 4,5-positions of naphthalene are substituted by an ethylene (or dimethylene) radical. Thus, the substance in question would be named tetramethylidyneacenaphthene.

It was a fairly simple synthesis. Condensation of acenaphthene with succinic anhydride yielded succinylacenaphthene, a diketone. The two ketone positions were reduced to alcohol groups by means of lithium aluminum hydride. Dehydration of the alcohol groups ($-CHOHCH_2CH_2CHOH-$ to $-CH=CH-CH=CH-$) was effected with hydrogen chloride, thus completing the synthesis.

The compound was less reactive than anthracene but more reactive than phenanthrene. Maleic anhydride formed an adduct but with some difficulty, and bromine reacted by substitution. Hydrogenation (platinum catalyst) yielded tetramethyleneacenaphthene.

1,8-Tetramethylenenaphthalene was prepared in 1951 by R. C. Gilmore, Jr., and Walter J. Horton of the University of Utah, Salt Lake City. Their approach was quite different from that of Boekelheide. Tetralin was changed into tetralone, thence into tetralinbutanoic acid. This was cyclized (dehydration) by means of phosphoric acid which contained phosphoric anhydride to a cyclic ketone, which in turn was reduced to the hydrocarbon by means of amalgamated zinc and hydrochloric acid.

Tropolones.—In 1942 B. Raistrick and collaborators isolated stipitatic acid as a cream-coloured metabolic product of the mould *Penicillium stipitatum* Thom. It was readily established that the compound possessed two phenolic hydroxyls and a carboxyl. A masked ketone group was suspected, since hydrogenation yielded a substance capable of reacting with ketone reagents. There was difficulty of incorporating these and other facts with the empirical formula, $C_8H_6O_5$, until M. J. S. Dewar's suggestion in 1945 that a seven-membered ring system was probably the basis of the structure. This system he regarded as the enol form of α-diketocycloheptadiene, and he coined its name as tropolone to show the seven-membered ring as in tropines, the hydroxyl group as in enols, and the ketone suffix. Stipitatic acid was regarded as 4-hydroxy-6-tropolonecarboxylic acid. Later work substantiated this viewpoint.

A. N. Johnson and A. R. Todd of Cambridge, Eng., showed that this acid is cleaved by alkaline peroxide into malonic and aconitic acids. Another reaction in harmony with the structure is the fusion with caustic potash to yield 5-hydroxyisophthalic acid, the mechanism following the well-known benzilic rearrangement of alpha diketones.

Tropolone was unknown in 1945 when it was suggested by Dewar. It was synthesized in 1951 by W. E. Doering and Lawrence H. Knox of Hickrill Chemical Research foundation (Katonah, N.Y.) by oxidizing tropilidine with alkaline permanganate. They pointed out that this remarkable compound is not only an acid (yielding a sodium salt) but also a base (yielding salts with hydrochloric or picric acids). It behaves like phenol in substitution reactions with bromine, nitrous acid, nitric acid or benzenediazonium chloride. Edgar Heilbronner and Kenneth W. Hedberg of the California Institute of Technology reported that electron diffraction measurements taken on tropolone support its structure unambiguously.

J. W. Cook (Glasgow, Scot.) and co-workers also synthesized tropolone in 1951 but by a different route. From cycloheptanone, they prepared 1,2-cycloheptanedione by oxidation with selenium dioxide. Most of the hydrogens were stripped off by bromine, leaving 3-bromotropolone, the sodium salt of which was converted to tropolone by hydrogen with palladium catalyst.

R. D. Haworth and P. R. Jeffers of Sheffield, Eng., synthesized 4-methyltropolone, using degradation methods on purpurogallin (*see* below) and from it prepared the several isomeric nitro and amino derivatives. The amines were diazotizable but did not decompose into phenolic analogues in the presence of hot acid solution; instead, there was ring contraction to yield methylsalicylic acid.

T. Nozoe and collaborators of Tohoku university, Japan, also observed formation of salicylic acid during diazo treatment of an aminotropolone.

The fifth independent synthesis of tropolone was reported by J. D. Knight and Donald J. Cram (University of California, Los Angeles). Their approach involved an acyloin condensation of ethyl pimelate, followed by a dehydrogenation using bromine.

Tropone (cycloheptatrienone) was synthesized by Hyp J. Dauben, Jr., and H. J. Ringold (University of Washington, Seattle) in 1951 from 2-cycloheptenone by bromination followed by hydrogenolysis. Its substitution reactions resembled those of tropolone, and here again the carbonyl group was indifferent. The same authors prepared cycloheptanone from cyclohexanone by a nitromethane condensation sequence, the last step being ring enlargement of 1-(aminomethyl) cyclohexanol by diazotization with nitrous acid.

Thujaplicin.—Western red cedar (*Thuja plicata* D. Don.) contains compounds removable from its heartwood by steam distillation, which contain the same unusual cycloheptatriene ring system. Apparently these compounds are responsible for the strong resistance shown by this wood against wood-destroying fungi. The work of H. Erdtman and J. Gripenberg (Helsinki, Fin.) demonstrated that the three isomeric thujaplicins (α of m.p. 34° C., β of 52° C. and γ of 82° C.) are simply 2-, 3- and 4-isopropyltropolones. The fourth compound, thujic acid, is 4,4-dimethylcycloheptatrienecarboxylic acid. This structure explains its isomerization to cumic acid by hot acids, its decomposition to dimethylmalonic acid by permanganate oxidation and its reduction to hexahydrothujic acid by hydrogen and platinum.

Colchicine.—This alkaloid had been known for many years but interest in it among geneticists and biochemists had become large since about 1940 because of its capacity to stop cell division at the early metaphase. This makes it valuable in cytological studies, in the bioassay of hormones, in the artificial production of polyploid varieties of animals and plants and possibly also as a chemotherapeutic agent against cancer. It was once thought to have a tricyclic structure like phenanthrene, but after Dewar's suggestion in 1945 that its tricyclic structure contained two seven-membered rings, it was reinvestigated in many chemical laboratories, especially those of J. D. Loudon and J. W. Cook (Glasgow, Scot.), D. Stanley Tarbell (University of Rochester), T. Reichstein and F. Santavý (Switzerland) and Henry Rapoport (University of California, Berkeley). The Swiss workers isolated no less than seven new crystalline alkaloids from the seeds, flowers and corms of the common autumn crocus (*Colchicum autumnale* Linn). At least four of these are closely related to colchicine, the differences being $-NHCHO$ in place of $-NHCOCH_3$, or OH in place of OCH_3 in the formula.

As a result of the recent work the following structure for colchicine may be visualized: a central 1,2:3,4-cycloheptadiene ring holding an acetamido ($-NHCOCH_3$) group at position 5; fused at 1,2 is a benzene ring carrying three methoxy (OCH_3) groups; fused at 3,4 is tropolone methyl ether, the tropolone attachment being at its 4,5 bond. The tropolone structure explains the esterlike properties of the alkaloid revealed by the ease of hydrolysis of the methyl group in this ring, forming colchiceine and methanol, and the nonreaction of the compound with carbonyl reagents. Rapoport degraded colchicine to a simpler compound lacking the amide group on the central ring and lacking the oxygens and the double bonds of the other seven-membered ring.

Rapoport also developed a method for enlarging the central 6-ring of phenanthrene to a 7-ring analogue, which synthesis is valuable in colchicine studies.

Purpurogallin.—This red-coloured compound formed by oxidation of pyrogallol was discovered in 1869 by A. Girard. M. Nierenstein found in 1919 that it occurred naturally as glucosides in the colouring matter of various galls. Its structure was established about 1948 as a benzotropolone by J. Barltrop and J. S. Nicholson (England). Thus, a benzene ring holding three phenolic hydroxyls as in pyrogallol is fused at position 4,5 to the 3,4 bond of tropolone.

Sir Robert Robinson speculated during 1951 on the possible origin of these several tropolone ring systems in nature. He suggested that catechols react with formaldehyde or its biological equivalent so that a quasi-cyclopropane ring arises by attachment of the CH_2 group from formaldehyde to adjacent carbons of the catechol. Opening of the cyclopropane ring and readjustment of hydrogens would give rise to the tropolones. (*See* also BIOCHEMISTRY; CHEMOTHERAPY; PHYSICS; VITAMINS AND NUTRITION.)

(C. D. HU.)

Chemotherapy.

In 1951, experiments on both humans and animals indicated that hydrocortisone (Compound F), rather than cortisone (Compound E), was the chief hormonal component of the adrenocortical secretion. Hydrocortisone had greater effectiveness than cortisone when injected into local joint spaces of rheumatoid arthritic patients. Both ACTH and cortisone became relatively plentiful but hydrocortisone was in short supply. The possible dangerous effects of the use of these hormones became more evident during the year. Certain infections seem to spread more rapidly if the patient is treated with ACTH, cortisone or hydrocortisone. The hormones also must be used with caution in patients with diabetes, peptic ulcer, high blood pressure and chronic heart disease. Cortisone and hydrocortisone had simplified the control of Addison's disease.

The first total synthesis of a steroid hormone from the relatively simple chemical compound orthotoluidine was reported

SWIRLING WARM WATER treatment for U.S. veterans stricken with frostbite during winter combat in Korea. New treatment concentrated on the use of drugs at the outset to maintain circulation and prevent loss of limbs

by chemists of Harvard university during the year.

The three antibiotics capable of attacking most infections, aureomycin, chloramphenicol and terramycin, gained wider usage during the year and were found to possess antiprotozoan activity against *Endamoeba histolytica,* the organism responsible for amoebic dysentery. The antibiotics were found effective against the malarial parasites, but verification of this work was necessary before these antibiotics would be employed in malarial treatment.

Streptomycin, aureomycin, chloramphenicol and terramycin were reported successful in the treatment of the highly infectious venereal disease lymphogranuloma venereum.

Polymyxin B sulphate was introduced commercially during 1951. It is effective against gram-negative organisms including *Pseudomonas aeruginosa* which is resistant to the other available antibiotics.

Neomycin, which resembles streptomycin in its antibacterial range, showed usefulness in genitourinary infections and septicaemia. Its use, however, is limited by its tendency to cause damage to the kidneys.

Bacitracin, in conjunction with penicillin, showed effectiveness in controlling endocarditis, an inflammation of the lining surfaces of the heart.

Activity in antibiotic research was manifested by the introduction for experimental purposes of Fungicidin, effective against certain fungi which cause histoplasmosis, a disease resembling tuberculosis; of Prodigiosin, effective against *Endamoeba histolytica,* the causative agent of amoebic dysentery; and of Synnematin, effective against salmonella and shigella organisms which are responsible for bacterial dysenteries.

Certain streptococci and many varieties of staphylococci were discovered to be developing resistance to the effects of penicillin. Because of the wide use of penicillin, more cases of severe allergic reactions were encountered in patients. To make possible the use of penicillin in such allergic patients, several varieties of hypoallergenic penicillins were developed and at least two were introduced commercially. It was hoped that these new penicillins would reduce the number and severity of allergic reactions.

Tetraethylthiuram disulphide or Antabuse, a drug which had been extensively studied for the long-term treatment of alcoholism, was released commercially during the year. The drug must not be utilized to treat acute alcoholism but may be used in conjunction with psychotherapy to break the alcohol habit. A patient who has been treated with the compound and imbibes even small quantities of alcohol undergoes an extremely unpleasant cycle of events. The face flushes, the heart rate increases alarmingly, breathing becomes difficult and nausea and vomiting ensue.

This treatment requires the active co-operation of the patient who must be psychologically prepared to accept the method of therapy.

Radioiodine 131, a radioactive isotope, became recognized as a treatment for both thyroid cancer and for hyperthyroidism. Radioiodine 132, because of its extremely short half-life, was advocated as the safer therapeutic form of radioactive iodine. Both isotopes of iodine were recommended for test of thyroid function by measurement of the amount of radioiodine taken up by the thyroid over a period of time. This method seemed to yield results superior to those obtained with the usual methods of computing basal metabolic rates.

Gold 198 was found to localize in ovarian tumours and to inhibit their growth. This form of treatment provides gamma-rays without the necessity of deep X-ray therapy.

Gallium 72 proved valuable in the early diagnosis of cancer spread to the bones. Localization of such tumours was possible with radioactive gallium before the lesions were discernible by skiograms (X-ray negatives).

In the treatment of cancer, triethylene melamine had shown value in leukemia and Hodgkin's disease. First used in the rayon industry, its chemical resemblance to the nitrogen mustards led to its employment. In contrast to the mustards, which must be administered intravenously, triethylene melamine was given orally and produced significantly less nausea and vomiting but had equal therapeutic effect. Progesterone, one of the female sex hormones, given in large doses was reported as exerting at least a temporary ameliorative effect upon cancer of the cervix.

The citrovorum factor, so named because it is essential to the life of the organism *Leuconostoc citrovorum,* showed itself capable of overcoming the adverse effects of the antifolic acid compounds such as pteropterin. This permitted use of larger doses of the folic acid antagonists in cancer treatment.

The enzymes streptodornase and streptokinase, derived from haemolytic streptococcus organisms, were advocated for cleansing infected wounds, thus reducing the amount of scar tissue formed. The combination of enzymes was also said to be valuable in the treatment of sinusitis, pleurisy and osteomyelitis.

Another enzyme, trypsin, from animal sources, was made available in highly purified form and was reported effective in dissolving necrotic (dead) tissue and pus, especially in tuberculous empyema. It apparently possesses the advantage of attacking only dead tissue without affecting viable cells.

The penta-, hexa- and decamethonium bromides showed ability to reduce blood pressure in hypertensive patients, but tolerance to the drugs develops rapidly. It was also disclosed during the year that the effects of a hypertensive factor, apparently secreted in the brain, were overcome by a new compound 1-hydrazinophthalazine.

In 1951 increased hope for patients with myasthenia gravis, a chronic disease with characteristically progressive muscular weakness, resulted from the introduction of octamethyl pyrophosphoramide, an anticholinesterase with longer protective action than formerly attainable.

Ethyl vanillate was reported fairly effective in the treatment of disseminated histoplasmosis, a serious illness which attacks vital internal organs.

Xenon, one of the rare gases, in 80% concentration with 20% oxygen, was shown to be an effective anaesthetic agent producing unconsciousness in five minutes and anaesthesia of the surgical plane in ten minutes. No unpleasant side effects were noted.

Two new drugs of the quaternary ammonium series, 3-hydroxy-trimethyl-phenyl-ammonium bromide and 3-hydroxy-phenyl-dimethyl-ethyl-ammonium bromide, successfully overcame overdosage effects of curare. Curare is of value in securing adequate muscle relaxation during surgery but may cause paralysis of respiration.

Banthine, an anticholinergic quaternary amine previously successful in the therapy of peptic ulcer and conditions complicated by nausea and vomiting, was reported to quickly abort herpes zoster, the painful skin and nerve condition familiarly known as shingles.

Selenium sulphide was introduced in a suspension form as an agent for the relief of the itching and burning of seborrhoeic dermatitis, especially of the scalp (dandruff).

Depressed psychotic patients were reported to respond favourably to d-lysergic acid diethylamide, an ergonovinelike compound. It apparently induced a state of well-being and permitted recall of provoking experiences without causing confusion or the distressing convulsions of insulin and electroshock therapy.

The carboxylic resins, originally developed for shipwrecked sailors and used to make drinking water out of sea water by removing the salt, were shown after several years of intensive experimental research to be valuable adjuncts in the treatment of heart disease. They also were of value in hypertension because of their ability to remove sodium ion from the system. The commercial grades of the resins proved unsuitable for therapeutic use. The carboxylic resins are combined with some potassium ion to prevent development of potassium deficiency since the resins tend to remove all cations. The resins are of extremely small mesh, almost resembling an impalpable powder. Their chief value is in controlling the quantity of sodium in the body and thus indirectly controlling the amount of water in the tissues and blood.

Drug Production.—The total output of synthetic medicinals in the United States in 1950 was 46,100.000 lb., which was a rise of 11% over 1949 production. The production of antibiotics was 852.900 lb. Total production of synthetic vitamins was 3,500.000 lb., compared with 2,900,000 lb. in 1949. The output of sulfa drugs was 5,000,000 lb. compared with 4,900,000 lb. in 1949. Production of aspirin in 1950 totalled 11.000,000 lb. compared with 10,400.000 lb. in 1949. Barbituric acid derivative production was 688,500 lb., or 8,700 lb. greater than in 1949. (*See* also Allergy; Bacteriology; Chemistry; Malaria; Medicine; Surgery; Veterinary Medicine; Vitamins and Nutrition.) (P. L. W.)

Chemurgy. A new substitute for jute made its first extensive appearance on United States soil during 1951. The newcomer was kenaf (*Hibiscus cannabinus*). A 700-ac. crop from muckland areas in the Okeechobee section of Florida was harvested in November.

Jute, grown mostly in Pakistan and India, had become highly essential to the economy of the U.S. for bagging and cordage and for certain uses in floor coverings. Defense authorities had asked the department of agriculture to develop nearer sources so that supplies might be obtained despite possible future interruptions of overseas commerce.

Kenaf was chosen as the most promising plant, since jute itself appeared not to be adaptable to the western world. Kenaf apparently had oriental origins, and was produced to some extent in the Italian colonies before World War II. During recent years the office of foreign agricultural relations of the U.S. department of agriculture had fostered experiments with kenaf in Cuba and Central America. Cuban seed was therefore available for the 1951 Florida plantings. The Commodity Credit corporation contracted with three companies for production, offering 30 cents per pound for top-quality fibre. Yields upward from 1,500 lb. per acre were expected. At the year's end kenaf fibre was being offered in generous sample quantities for industries which desired to experiment with it.

The plant grows 8 to 12 ft. high. Stalks measure from one-half to three-fourths inch in diameter. Kenaf matures in 100 to 125 days. About 200 varieties were being tested by the Everglades Experiment station of the University of Florida.

Defense requirements had demanded extraordinary increases in production of castor beans for oil. The 1950 plantings had been 9,000 ac., and the munitions board requested that 90,000 ac. be harvested for 1951. This was accomplished, and the goal for 1952 was stepped up to 200,000 ac. In midsummer Pres. Harry S. Truman requested by special message to congress that $200,000 be set aside to hasten castor-bean research and to seek substitutes for other oils which were essential to the defense program and which had to be imported. In lubricants and brake fluids castor oil retains its fluidity at temperatures either extremely low or extremely high. The increased demand was related in part to developments in jet planes. For more than a decade public and private research had sought to overcome difficulties incident to establishing castor beans as a new crop for U.S. farmers. While 150,000,000 lb. of the beans were imported in 1939, mostly from Brazil, demand had grown until 250,000,000 lb. annually was expected to be normal.

To fit U.S. farming practices, varieties of castor beans that were adapted to machine harvesting had to be bred. This required a short stalk, four to eight feet high, the characteristic of retaining the seeds so that all could be gathered at one time, larger yields and less foliage. These objectives were accomplished, although further improvements were being sought. A suitable harvesting machine had also to be devised, which was done. Chemical defoliants were used successfully in situations where frost did not remove the leaves naturally.

California, Arizona, Oklahoma and Texas were growing most of the castor beans. Under irrigation, yields were obtained which exceeded 2,500 lb. per acre, while 500 to 1,500 lb. per acre were produced without irrigation. Growing costs compared favourably with those of corn, peanuts and cotton. The 1951 guaranteed price was ten cents per pound. Castor oil is an ingredient in many plastics, in types of synthetic rubber, protective coatings, nylon, cosmetics, linoleum and many other items. Its complicated molecular structure gives it unusual versatility.

Antibiotic manufacture, which leaped to huge dimensions after World War II, emerged in 1951 with a by-product sale estimated at nearly $50,000,000. Considerable notice was given during the year to APF (animal protein factor), which stimulates the growth rate of young animals by 15% to 20%. APF is produced from the crude dried solubles in the fermentation broths from which pharmaceutical antibiotics are manufactured. Since these broths are compounded of corn steep water and milk sugar, the new material is wholly chemurgic. It was marketed to livestock-feed manufacturers as a free-flowing powder, added to feeds at rates of from 5 to 50 g. per ton.

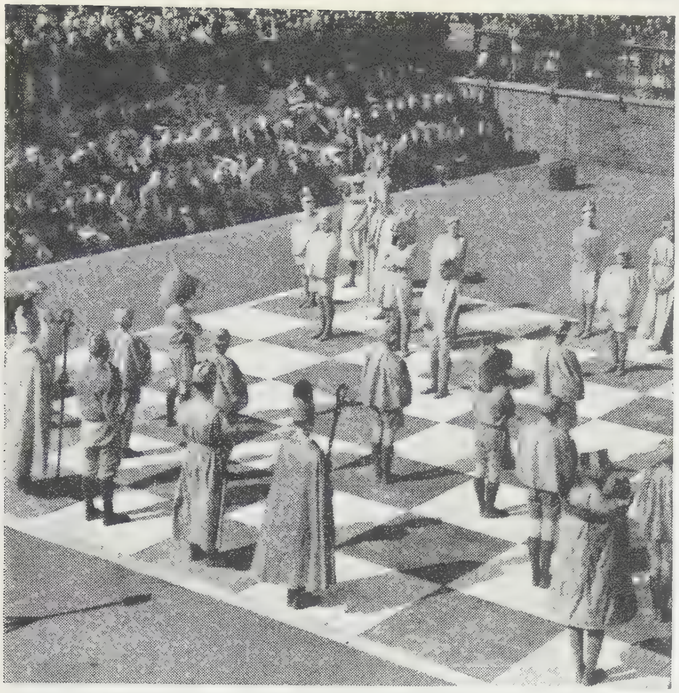
Substitutes and extenders for blood plasma were the subject of considerable 1951 chemurgic research. Dextran, a polysaccharide derived from cane or beet sugar, showed substantial promise, and was shortly to be in production. A plant for this purpose, costing $1,500,000, was being erected at Terre Haute, Ind. Its output was to go exclusively to meet military requirements. (W. McM.)

Cherries: *see* Fruit.

Chess. Larry Evans, 19-year-old student at the College of the City of New York, became the youngest player ever to win the United States Chess federation closed title when he placed first ahead of 11 rivals at New York city in August. Evans finished with a score of 9½–1½ points. Evans had already captured national open laurels and retained his U.S. speed title at Ft. Worth, Tex., in July. Mrs. Mary Bain, Miami, Fla., triumphed in the U.S. women's championship at the Marshall Chess club, New York city, in November.

Visits by international masters added interest to the American scene. Samuel Reshevsky of New York city topped a field of 12 in the Wertheim Memorial tournament at the Manhattan Chess club, but only by a narrow margin. Another meeting of six masters at the Marshall club resulted in a tie between young Evans and Reuben Fine, New York city.

James T. Sherwin, Columbia university, won New York state laurels at Syracuse in September, dethroning Eliot Hearst, another Columbian, who was runner-up. Sherwin took another title from Hearst on Dec. 30 at Philadelphia when he led 23 players in the biennial session of the National Intercollegiate Chess league. Sherwin finished with 6–1, with Hearst again second with 5½–1½. Columbia won the intercollegiate league team honours and Boston college triumphed in the Jesuit league tourney.



LIVING CHESSMEN at the 1951 Festival of Britain demonstrating a match between the British and French champion players R. J. Broadbent and Nicholas Rossolimo

The challenge match for the world title held by Mikhail Botvinnik of the U.S.S.R. and David Bronstein, another soviet star, was staged in Moscow, and the prolonged battle ended in a deadlock with each player being credited with 12 points. However, under a ruling of the International Chess federation, Botvinnik retained his championship. B. Ivkov of Yugoslavia won the world junior title at Birmingham, Eng.

Miguel Czerniak of Israel starred in international competition with triumphs in the Schlechter Memorial tournament at Vienna, Aus., in July, when Erik Lundin of Sweden was second, and in the masters' tourney at Venice. Wolfgang Unzicker of Munich, Ger., came out on top in the first major tournament of 1951 when he won the annual competition of the Hastings Chess congress in England early in January. Honours at Madrid, Sp., in June were taken by Lodewijk Prins of Amsterdam, Neth.

(T. V. H.)

Chiang Kai-shek (1887–), virtual ruler of China for more than two decades before the national government was driven to Taiwan (Formosa) in 1949 by the Communists, regained some of his lost prestige and popularity with the Chinese people during 1950 and 1951, particularly after the Peking regime's intervention in the Korean war and its suppression and execution of the "counterrevolutionists." To the western democracies which were fighting Communist aggression as well as to the political parties and social groups in the United States which were debating the U.S. far eastern policy, Chiang remained a controversial figure and a storm centre of international politics. Nevertheless Chiang was firm in his fight against the Chinese Communists and the soviet domination of China. Early in May 1951 he urged the Chinese on the mainland to unite and expand their underground activities, and shortly afterward said that his forces could hamper if not halt the Chinese Communist aggression in Korea by invading the mainland.

The exclusion of China from the Japanese Peace conference at San Francisco, Calif., in September caused bitter disappointment to Chiang, who insisted on nationalist China's right to participate. On the 40th anniversary of the Chinese republic on Oct. 10, Chiang expressed confidence that free China would not fail to recover its national territory and sovereignty. In his message of Oct. 25, observing United Nations day, he said: "We, the freedom-loving people of China, will always stand for the cause of the United Nations. . . . We will continue this fight until freedom is restored to our compatriots on the mainland and peace prevails on earth." (*See* also CHINA.) (H. T. CH.)

Chicago. Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., Chicago lies at the southwest corner of Lake Michigan. Its population in the 1950 census was 3,620,962, an increase of 6.6% over the 1940 population. For the six-county Chicago metropolitan area the 1950 census showed 5,495,364, a 13.9% increase. The mayor in 1951 was Martin H. Kennelly.

The city in 1951 enjoyed a year of exceedingly high business activity, setting all-time records in many industries, including steel production, foods, fabricated metals, machinery, chemical and petroleum products and in the output of electric power. Employment rose to an all-time high and unemployment dropped to a low level. During the year production for defense purposes expanded greatly, partly through a shift from manufacture of civilian goods and partly through the use of new facilities and additions to the labour force.

Bank clearings for 1951 increased 11.1% to $44,780,176,838 from $40,674,982,625 in 1950. New investment in industrial plants in 1951 amounted to $401,586,000, compared with $325,347,000 in 1950. The 1951 figure was the largest for any year except 1942.

Production of the Chicago area's manufacturing plants amounted to $17,300,000,000 in 1951, a record volume. Steel production in the Chicago metropolitan area, second only to that of Pittsburgh, amounted to 18,890,000 net tons in 1951, an increase of 7% over the previous record of 17,590,000 tons produced in 1950.

Retail sales in 1951 were estimated at $4,800,000,000 for the year 1951, an increase of 4% over the 1950 retail sales. Chicago continued to be the world's largest centre of rail and air traffic.

There were no major labour difficulties in Chicago during the year. The total number of workers involved in strikes was 18,000 in 1951 as against 22,700 in 1950.

Passengers carried on the lines of the Chicago Transit authority continued to decline. In 1951 the total passengers carried numbered 736,987,283, a decline of 6.6% from 790,230,981 passengers carried in 1950.

All types of construction in the first 11 months of 1951 involved an outlay of $482,132,552, a decline of 10.6% from the first 11 months of 1950 when similar expenditures amounted to $539,767,688.

In the first 11 months of 1951 permits for the building of individual homes in Chicago totalled 6,401; in suburban towns 15,023; and in unincorporated areas 4,591—a total of 26,015. At the same time there were constructed within the city limits 4,365 apartment units and in the suburbs 841 apartment units for a grand total of 31,221 dwelling units in the period.

The total public assistance burden in Cook county in 1951 approximated $66,000,000, with an average of 133,300 persons on relief rolls throughout the year. The December total for persons obtaining some form of assistance in Cook county was down to 130,000.

The 1952 total budgets of the six governments that cover Chicago in whole or in part follow: city of Chicago $326,502,975; Cook county $72,183,779; Cook county forest preserve $5,596,192; Chicago board of education $274,838,905; Chicago sanitary district $29,281,347; Chicago park district $40,487,805.

(L. LN.)

Child Labour.

United States.—According to estimates of the U.S. bureau of the census, an average of 2,500,000 minors 14 through 17 years of age were employed full time or part time during the first ten months of 1951, an increase of approximately 200,000 over the same period in 1950. Of these, 900,000 were 14 or 15 years of age, and 1,600,000 were 16 or 17 years of age. One-third of all young workers were employed in agriculture; the two-thirds in nonagricultural employment were concentrated mainly in trade and service occupations.

The program of the U.S. department of labour for the administration of the child-labour provisions of the Fair Labor Standards act was extended further to give protection to children brought under the child-labour coverage by the amendments which became effective in Jan. 1950. Special attention was given to the application of the 16-year minimum age to children employed in agriculture during school hours, to spreading understanding of the provision and to stimulating action aimed to get children under 16 years of age into school.

Comparatively little legislation relative to child labour or employment standards for young workers was enacted by the individual states during 1951. Delaware passed a law requiring that age certificates be obtained for employed minors of 16 and 17 years of age. Formerly the law required employment certificates for minors under 16, while age certificates were issued only upon request for minors of 16 and 17 years of age. New Hampshire extended the 14-year minimum age standard in that state to include all occupations except agriculture and domestic service, instead of only specified occupations. California provided 50% additional compensation under the workmen's compensation act for minors injured while illegally employed.

Compulsory school-attendance provisions, closely related to the employment of children, were strengthened or clarified in Illinois, Indiana, Wisconsin and Oregon.

A significant trend in the U.S. was the continued increase in the number of minors enrolled in school who worked outside school hours. In Oct. 1950, 83% of the population 14 through 17 years of age were enrolled in school. Approximately 25% of these young persons, or one out of every four, were working outside school hours.

The needs for expanding guidance and counselling facilities in schools, employment offices and youth-serving agencies and for further protection of young workers were given national emphasis by the Midcentury White House Conference on Children and Youth. The conference also recommended recognition of the emotional factors involved in vocational adjustment, the establishment and enforcement of standards on minimum age, working conditions and wages, and stressed the importance of good standards for part-time employment outside school hours.

National concern over the lack of adequate educational provisions for the children of agricultural migrants found expression in the report of the president's Commission on Migratory Labor. The commission made recommendations for development of a plan to provide an adequate program of education for migratory workers and their children, for vigorous enforcement of the child-labour provisions of the Fair Labor Standards act, for raising the standards of state child-labour laws and making them fully applicable to agriculture and for action along many other lines to improve conditions for migratory workers.

Great Britain.—About 536,625 young persons under 18 years of age entered employment in Great Britain during the 12-month period ending Jan. 31, 1951, after terminating full-time school. The majority, both boys and girls, left school at the legal 15 years of age, and entered employment before 16 years of age. In general the interval between leaving school and entering employment was short.

A permanent program was developed by the Youth Employment service to assist young people with special aptitudes for skilled occupations for which there were no suitable training facilities within daily travelling distance of their homes. The program provided financial assistance through grants to cover travelling expenses and maintenance away from home. In the first nine months of operation more than 700 applications from individual young people for assistance were approved.

Other Countries.—During 1951, four countries—Ceylon, France, Iraq and Pakistan—ratified International Labour organization conventions dealing with child labour. Ceylon ratified convention no. 5, fixing the minimum age at 14 for industrial employment; convention no. 15, fixing the minimum age for the admission of young persons to employment as trimmers or stokers; and convention no. 16, concerning compulsory medical examinations of children and young persons employed at sea. Pakistan ratified convention no. 90, prohibiting night work for young persons in industrial undertakings. France ratified convention no. 10, establishing a 14-year minimum age for employment in public or private agricultural undertakings during hours fixed for school attendance; and convention no. 78, concerning medical examinations of children and young persons for employment in nonindustrial occupations. Iraq and France ratified convention no. 77, concerning medical examinations for fitness for employment in industry of children and young persons.

(E. S. J.)

Children's Books.

The emphasis in children's books of 1951 was notably on realism, on informational and historical books, on easy-to-read material, on lavish colour in picture books and on a generally high level of book design. The picture books ranged from pastels to startling colours. The Caldecott winner, Leo Politi, reminisced in *Little Leo* and that intrepid pair William Lipkind and Nicolas Mordvinoff produced *Finders Keepers*. *Me and the Bears* by Robert Bright and *Jeanne-Marie Counts Her Sheep* by Françoise were appealing; originality of plot, vigour of illustration and humour characterized *The Camel Who Took a Walk* by Jack Tworkov, *Polly's Oats* by Marc Simont and *Mr. T. W. Anthony Woo* by Marie Hall Ets. Enjoyable stories to be read to the six- to eight-year-old were *The Horse Who Had His Picture in the Paper* by Phyllis McGinley, the delicately imaginative *The Mousewife* by Rumer Godden and the account of the New Year's Mummer's parade in *Patrick and the Golden Slippers* by Katherine Milhous. This younger age also was introduced to space through *Ups and Downs* by Ethel S. Berkley and to movement in art in *What's in a Line?* by Leonard P. Kessler. Easy-to-read pioneer books included *Caroline and Her Kettle Named Maud* by Miriam E. Mason and *Broncho Charlie* by Henry V. Larom. Several nature books were Olive L. Earle's *Thunder Wings* (ruffed grouse) and Robert M. McClung's *Stripe* (chipmunk). Stories in sequel were Ruth S. Gannett's *The Dragons of Blueland* (about Elmer Elevator) and Maude Crowley's *Azor and the Blue-Eyed Cow*. Girls in the third grade sympathized with *Ellen Tebbits* by Beverly Cleary and with *Ginnie Joins In* by Catherine Woolley.

Boys and girls of 10 to 12 enjoyed *The Wishing Pear* by Elizabeth Coatsworth (New Amsterdam, 1664) and the family story of *The Golden Root* by William O. Steele (Tennessee, post-Revolution). Biography and legend for this age was represented by *Andrew Jackson* by Genevieve S. Foster and *The Apple and the Arrow* (William Tell) by Mary and Conrad Buff. Humour characterized *Miss Pickerell Goes to Mars* by Ellen MacGregor and *Gertie, the Horse Who Thought and Thought* by Margarite Glendinning. Stimulating to inquiring minds were *The Great Whales* by Herbert S. Zim and *Minn of the Mississippi* by Holling C. Holling. Equally interesting were *People Are Impor-*

tant by Eva K. Evans, *Patterns in the Sky* by William M. Reed, *Everyday Weather and How It Works* by Herman Schneider and *Easy Puppets* by Gertrude Pels. Noteworthy for characterization and integrity were Valenti Angelo's *The Marble Fountain,* a story of post-World War II Italy, and *Little Vic* by Doris Gates, about a Negro stable boy. The contributions of different racial groups provided the theme of *Tansy for Short* by Ruth L. Holberg (Norwegians), *The Quarry Adventure* by Lee Kingman (Finns), *Elder Brother* by Evelyn S. Lampman (Chinese) and *Carol's Side of the Street* by Lorraine Beim (Jews).

Books with a historical setting for older boys and girls ranged from prehistoric times in *Fire-Hunter* by James Kjelgaard, to biblical Persia in *Behold Your Queen!* by Gladys Malvern, to 14th-century England in *Three Golden Nobles* by Christine Price and to the American scene as in *Unwilling Pirate* by West Lathrop (1720) and *Indian Fur* by Glenn Balch (Shoshone and Blackfeet, 1832). There were several unusual animal stories for the mature reader, including one by a Russian-American, Nicholas Kalashnikoff, *The Defender* (a shepherd and his rams). Kenneth C. Randall wrote of hunting dogs in *Wild Hunter* while William M. Rush did an above-average story in *Wild Horses of Rainrock*. Boys kept abreast of some of the latest developments in science through *Rockets, Jets, Guided Missiles and Space Ships* by Fletcher Pratt and *Aircraft U.S.A.* by H. E. Huntington, and enjoyed *Experiments in Optical Illusion* by Nelson F. Beeler and F. M. Branley. Worth-while books were Elizabeth C. Baity's *Americans Before Columbus;* Katherine B. Shippen's *Leif Eriksson* and James H. Daugherty's *Of Courage Undaunted* (Lewis and Clark); while younger teenagers read *America's Robert E. Lee* by Henry S. Commager. Older girls enjoyed *Ride Out Singing* by Alice F. Loomis and boys found *Pong Choolie, You Rascal!* by Lucy H. Crockett a gripping story of a South Korean boy today.

There were several enjoyable translations, notably *The Saucepan Journey* of Edith Unnerstad (Swedish), the highly original picture book *The Blue-Eyed Pussy* by Egon Mathiesen (Danish), *The Wonderful Farm* of Marcel Aymé (French) and a tale of epic quality laid in Greenland, *Eskimo Boy* by Pipaluk Freuchen. Folk literature was preserved through an account of Charlemagne, *Huon of the Horn* (André Norton) and by some Northwest Indian legends, *Nine Tales of Raven* (Frances G. Martin). The ethnic contributions of the Indians of the Pacific northwest were found in *The Story of the Totem Pole* by Ruth Brindze and *Before the White Man Came* by Mildred Jenkins.

Christmas stories were numerous and books for family enjoyment were represented by *Famous Paintings,* edited by Alice E. Chase; *This Is the Way,* edited by Jessie M. Jones, showing the universality of worship; and *An Album of Horses,* compiled by Marguerite Henry and illustrated by Wesley Dennis. A new edition of *The Story of a Bad Boy* by Thomas B. Aldrich appeared, also freshly illustrated old favourites in the Macmillan New Children's classics. Librarians and teachers welcomed two valuable reference books, *The Oxford Dictionary of Nursery Rhymes,* edited by Iona and Peter Opie and the new edition of *The Junior Book of Authors,* edited by Stanley J. Kunitz and Howard Haycraft. (*See* also BOOK PUBLISHING; LITERARY PRIZES.) (E. A. Gs.)

Great Britain.—During 1951 fairy stories, original and traditional, continued to cast their spell. Children delighted in the imaginative qualities of *The Faun and the Woodcutter's Daughter* by Barbara Leonie Picard and the Chinese tales in *The Peach Blossom Forest* by Robert Gittings and Jo Manton. They found fantasy and adventure ingeniously blended in *The Dark Sailor of Youghal* by Patricia Lynch, *The Valley of Song* by Elizabeth Goudge, *Prince Caspian* by Clive S. Lewis and *The Flag from the Isles* by William Croft Dickinson. They appreciated the droll Finnish humour in *Comet in Moominland* by Tove Jansson and the animal characters in *Doctor Dolittle and the Green Canary* by Hugh Lofting.

PHOTOGRAPHING BIRDS in full colour in 1951 for a series of plates to appear in *Britannica Junior.* The plastic cage was especially built for the project and set up in the Chicago Zoological park at Brookfield, Ill.

English history was re-created in several stories with good characterization and interesting detail, including *Jockin the Jester* by Ursula Moray Williams and *The Gauntlet* by Ronald Welch (both 14th century), *The Wool-Pack* by Cynthia Harnett (15th century) and *The Armourer's House* by Rosemary Sutcliff (16th century). *Knave-go-by* by C. Fox Smith, *The Lintowers* by Elisabeth Kyle and *The Young Inverey* by John Niven were vigorous adventure stories with a period setting.

Among several stimulating career stories, mining was depicted with accuracy and understanding against a background of mystery in *The Whinstone Drift* by Richard Armstrong, journalism in *The Monday Story* by James Leasor and teaching in *First Year Up* by Doris W. Hackman.

Boys read about the wanderings of a poor lad and his cat in *The Cat Did It* by Brian Fairfax-Lucy, day school life in *Barry's Exciting Year* by A. Stephen Tring and country pursuits in *Rough Water* by Roland Pertwee. They found humour in *Timpetill* by Manfred Michael and stark realism in *The Long Arctic Night* by Kurt Schmeltzer, both originally published in Switzerland. Adventure and suspense at sea was the theme of *Thunder in the Bay* by Adrian Seligman. Modern science provided thrills in *Sunday Adventure,* by John Pudney.

Girls appreciated the building up of atmosphere in *The Dark Lantern* by Viola Bayley, the happy family relationships and Scottish background of *The House at Kilmartin* by Ann Bridge, and the vicissitudes of an early Victorian theatrical touring company in *Family Playbill* by Pamela Brown. They enjoyed the sensitive study of a child artist in *Picture Come True* by

Priscilla Warner and the activities of amateur detectives in *The Jennifer Jigsaw* by Shirley and John Newton Chance. Gardening formed a satisfying background to *The Dog-Leg Garden* by Dorothea Street and skating was featured in *White Boots* by Noel Streatfeild. *Four Rode Home* by Primrose Cumming and *Cargo of Horses* by Monica Edwards were outstanding among pony stories with human as well as equestrian interest.

Much thought and artistry went into children's picture books. Colour lithography was effectively used in Edward Ardizzone's *Tim and Charlotte,* Sergei Prokofiev's *The Story of Peter and the Wolf* and Clarke Hutton's *A Picture History of France.*

Informative books were popular and helped to satisfy curiosity on many subjects. Younger children were attracted by the clear, colourful drawings and simple text of *How the First Men Lived* by Marie Neurath and J. A. Lauwerys. *Come out of Doors* by C. D. Dimsdale and *Pond Life* by Richard L. E. Ford, were well-illustrated contributions to nature study. A revised edition of *The Animal's World* by Doris L. Mackinnon presented simple facts on zoology. *Flip* by Joan Wanklyn told the story of an otter. Children with a taste for travel books read *The Young Traveller in China* by C. E. Roberts and *Wall of Spears* by Mildred Cable and Francesca French. Interesting facts were assembled in *London Adventure,* a guide to London by Margaret M. Pearson. Practical books on sports and hobbies included *The Junior Woodworker* by Charles H. Hayward, *Cooking is Exciting* by Lady Peacock and *Soccer for Boys* by F. N. S. Creek.

Among biographical works were *Sir Walter Raleigh* by Hugh Ross Williamson, and Lord Mountevans' own story of his early career in *Happy Adventurer.*

Fine poetry was represented by Eleanor Farjeon's selection of her best verse in *Silver-Sand and Snow* and drama by *Beauty and the Beast* by Nicholas Stuart Scott. Geoffrey Trease helped children to appreciate good books in his *Enjoying Books.*

Several classics appeared in attractive new editions, including *Lorna Doone,* illustrated by Lionel Edwards, and *Fairy Tales from the Arabian Nights,* illustrated by Joan Kiddell-Monroe. The Library association Carnegie medal was awarded to Elfrida Vipont for *The Lark on the Wing.*

FILMS OF 1951.—*Children's Tales* (6 films) (Sterling Films); *Fox and the Rooster* (Encyclopædia Britannica Films Inc.); *Hansel and Gretel* (Austin Productions); *Wonderland Tales* (13 films) (Cornell Film Co.). (D. D. Ct.)

Child Welfare. The cost of child care and child welfare services was higher in 1951 than in other recent years. Consequently there was a testing of the willingness and ability of families and organizations, including governments, to increase the amounts spent in behalf of children. In some situations the results might be measured in terms of ground lost, but in most countries there were expansions and improvements in response to demands of the increased child population and the organized planning for children generated after World War II.

International Services.—"Health for Your Child and the World's Children" was the central theme for the observance of World Health day on April 7, 1951. A practical step toward realization of this goal was the development of a world-wide coordinated program, one of the principal achievements of the fourth World Health assembly held in Geneva, Switz., May 7 to 25. Regardless of the sources of funds available, the integration of services in 1952 was to include activities of three of the specialized agencies of the United Nations, the U.N. International Children's Emergency fund (U.N.I.C.E.F.), the Program of Technical Assistance for Economic Development and the World Health organization (W.H.O.). The W.H.O. fixed its effective working budget for 1952 at $7,700,000, in contrast with the $6,300,000 available in 1951.

SIDEWALK AUDIENCE watching the Whittier Boys' club house in Jersey City, N.J., get a new coat of paint in May 1951. One hundred union painters donated their work and completed the project in 7 min. 2 sec.

The W.H.O. and related organizations added in 1951 impressive gains in their campaigns against malaria, syphilis, tuberculosis, typhoid, typhus, yaws and other communicable diseases. Environmental sanitation, essential as a basis for the prevention of many diseases, was promoted in many parts of the world.

Among the efforts to supply the personnel needed was the first international project sponsored by the W.H.O. for field training of nurses, health visitors and midwives, started in Feb. 1951 in a rural area near New Delhi, India. The organization of four maternal and child health centres and the training of a substantial number of Indian health visitors were among the first year's achievements. The three-member W.H.O. team in charge, led by a Finnish pediatrician, operated with a local health unit established in 1937 by the Rockefeller foundation and continued for several years by the Indian health services. The area served consisted of 160 sq.mi. with a population of about 55,000 living in 70 villages.

The W.H.O. organized its regional committee for the western Pacific and established its temporary office for this region in Hong Kong. The region extended from Japan to New Zealand and, with the exception of China (not participating in the work in 1951) reached all areas with large populations and even some of the thinly populated islands.

The U.N.I.C.E.F. completed in 1951 its fifth year of operation and the first year under policies revised in accordance with a resolution adopted by the general assembly of the United Nations Dec. 1, 1950, and a budget which was a small fraction of the amount spent annually during the first years of the fund's existence. The resolution approved use of the fund's resources for the purpose of meeting, through the provision of supplies, training and advice, emergency and long-range needs of children and their continuing needs particularly in underdeveloped countries, with a view to strengthening, wherever this may be appropriate, the permanent child health and child welfare programs of the countries receiving assistance.

Typical of the program of the U.N.I.C.E.F. was its provision of supplies and equipment for a two-year maternal and child health project in Burma, begun in 1951, in collaboration with the W.H.O., which provided a team of 12 international experts, and the government of Burma, which provided Burmese counterparts for the international personnel, necessary auxiliary staff, necessary materials and services available locally, and office and living accommodations for the international staff.

The aims of the Burma project were: (1) establishment of a pediatric department in the Rangoon General hospital; (2) increasing the diagnosis and treatment of syphilis in mothers and children, including improved facilities for laboratory diagnosis, and supplies of penicillin for treatment on the most modern lines; (3) reorganization of the children's ward of the Rangoon General hospital and improvement of equipment at that hospital, at the Dufferin hospital and at the Mother's and Children's Welfare clinics; (4) improvement of facilities for teaching maternal and child care to doctors, nurses, midwives and other public health workers; (5) expansion of school health services; (6) a general strengthening of the Burmese health services by the provision of fellowships for study abroad, and by training given to nurses and other health personnel by the international staff.

The first four years of U.N.I.C.E.F. operations included provision of food and clothing as well as health supplies to children in war-devastated countries, the equivalent of about $150,000,000. A major and historic achievement was the antituberculosis campaign conducted under the joint auspices of U.N.I.C.E.F., the Danish Red Cross, Norwegian Relief for Europe and the Swedish Red Cross. This service, provided in 22 countries on five continents, included the testing of 37,000,000 children and young adults and vaccination with BCG (Bacillus-Calmette Guérin) of nearly 17,000,000 whose test reactions were unfavourable. Upon withdrawal of the Scandinavian organizations in 1951, this work was to be carried on by the W.H.O. with the assistance of U.N.I.C.E.F.

The International Refugee organization (I.R.O.) included hundreds of thousands of children among the 1,500,000 persons aided during the period 1947–50. Of these, nearly 900,000 were resettled and about 75,000 repatriated. Nearly 500,000 were still receiving legal protection or other types of assistance when the U.N. discontinued the I.R.O. in 1950 and established as its successor a high commissioner's office, located in Geneva, which began operations Jan. 1, 1951. This agency, with an annual budget of only $300,000, compared with the millions required to operate the I.R.O., had no responsibility for care and maintenance of refugees or for their repatriation or emigration. It ensured legal protection for many children and adults in various countries.

International conferences in 1951 significant to the welfare of children included the International Catholic Child bureau, Madrid, Sp., April 26–30; the fourth World Health assembly, Geneva, May 7–25; the World Assembly of Youth, Ithaca, N.Y., Aug. 5–16; the second International Poliomyelitis conference, Copenhagen, Den., Sept. 3–7; and the fifth World congress of the International Society for the Welfare of Cripples, Stockholm, Swed., Sept. 9–14.

National Developments.—Most of the countries devastated during World War II were able to restore many of the educational, health and welfare services which had been in existence before the war. Their continued provision of family allowances assured an economic basis for child care, especially in those countries least affected by inflation. The United States was the only large industrial country without a plan for family or children's allowances in 1951. Widespread improvement of nutrition and expansion of health services to children and mothers helped to lower the rates of morbidity and mortality.

The infant mortality and stillbirth rates in England and Wales were lower in 1950 than ever before. The infant mortality rate was 29.8 per 1,000 live births, approximately one-half the rate (60) that prevailed in 1941. In the United States the infant mortality rate also hit an all-time low of 29.2. (*See* INFANT MORTALITY.)

Typical of national developments in 1951 was the opening of the first children's hospital in Bolivia, which was to serve as a training centre for nurses and other professional personnel. The scarcity of physicians and nurses had become apparent as governments and voluntary organizations throughout the world sought the staffs necessary for their expanding health services. Hence the establishment of more training centres, expansion of existing training schools and recruitment of men and women for these and related professions constitute basic measures in

KOREAN ORPHANS clothed in outsized G.I. wear at a "collection station" in Seoul, where scores of homeless children were brought after being picked up by U.N. troops

nation-wide health programs affecting children.

Mental health was receiving increased attention in all countries where resources were needed for the development of child guidance clinics or other facilities for treatment of the emotionally disturbed. A study of the mental health aspects of the needs of homeless children by John Bowlby, made in France, the Netherlands, Sweden, Switzerland, the United Kingdom and the United States, was the subject of a W.H.O. report in 1951. The Child Welfare League of America concluded its study of residential treatment centres for emotionally disturbed children.

Children, often separated from their families, were victims of warfare in Korea. In behalf of them and adults deprived of homes and left without resources a voluntary organization, American Relief for Korea, was established.

Nearly 1,000,000 refugees living in camps in the Arab countries bordering Israel, many of them children, found life better in 1951 than in the preceding years. The International Committee of the Red Cross, League of Red Cross Societies, American Friends Service committee and agencies of the U.N. provided food, health supplies and various services. The plight of the children in these camps at the end of the year remained one of the world's most severe unsolved child welfare problems.

Child welfare planning in the United States was advanced during 1951 by federal, national, state and local organizations, several of which were created to carry out objectives of the Midcentury White House Conference on Children and Youth. On May 28 a new National Midcentury Committee for Children and Youth held its first meeting. Several state committees, most of them previously engaged in planning for the Midcentury White House conference in 1950, released reports of child welfare needs and resources within their states. Outstanding among these were the findings published by state committees in Illinois and New York and the Ohio Commission on Children and Youth.

Day care of children of working mothers received the attention of many organizations. Late in 1951 nearly 5,000,000 mothers with children under 18 years of age were employed outside the home. The Child Welfare League of America, co-operating with other national and federal agencies, completed a nationwide review of day care resources. Special studies of the need for this type of child care were made in several communities where defense industries sought large numbers of women workers. The Child Welfare league expanded its staff of day care consultants, using for this purpose funds obtained through the United Community Defense services, a project whereby several voluntary welfare agencies sought support for emergency activities developed after the Korean war made so many demands upon the United States.

Aid to dependent children, with larger grants than in 1950, constituted the country's most effective single measure for prevention of family breakdown and severe neglect of children. In June 1951 there were 1,617,893 children whose 632,649 families thus were spared distress or complete disruption. The grants for this purpose by the states, supplemented by federal funds authorized under the Social Security act, as amended in 1950, were available for the expenses of the mother or other relative providing care for the child, as well as for the child himself.

Increased narcotics addiction among youth in large cities received widespread attention of child welfare and law-enforcement authorities during 1951. Many organizations issued statements on the subject and participated in efforts to combat the illicit sale of narcotics and to develop services for treating young addicts. (*See* also Birth Statistics; Child Labour; Juvenile Delinquency; Marriage and Divorce; Red Cross; Social Security.)

Chile.

A republic extending along the southern Pacific coast of South America, with a coast line of 2,653 mi., and varying in width from 50 to 250 mi., Chile is bounded by Peru on the north, the Antarctic ocean on the south, Argentina and Bolivia on the east and the Pacific ocean on the west. It has an area of 286,323 sq.mi. and a population of 5,877,000 (1951 est.). Santiago, the capital, has 1,200,754 inhabitants (1950 est.). Other leading cities are: Valparaíso (198,068), Viña del Mar (98,156), Concepción (87,620), Antofagasta (47,326), Talca (44,859), Temuco (37,105), Iquique (34,864), Chillán (31,687) and Valdivia (30,308). Religion: Christian, mostly Roman Catholic. President in 1951: Gabriel González Videla.

History.—During 1951 Chile remained politically stable, continued its economic improvement and reaffirmed its democratic principles. The government was faced with strikes among the white-collar workers in February and in the copper industry in June. A six cents per pound increase in the price of copper, to 30½ cents per pound, as a result of trade negotiations with the United States made it possible to pay better wages in the copper industry. This increase was expected to produce an additional income of $77,500,000 per year.

Early in the year at a meeting of the United Nations Economic and Social council held in Santiago, the Chilean delegate, Eduardo Cruz Coke, suggested that Latin-American deposits in U.S. banks estimated at $800,000,000 be used to guarantee loans to the governments of the American republics in order to relieve the dollar shortage. At the same meeting another Chilean delegate, Francisco Labbe, praised the Point Four program for the economic development of backward areas and recognized the fact that the United States was contributing 55% of the funds for this program.

Eugene Black, president of the International Bank for Reconstruction and Development, visited Chile early in the year and agreed to make a complete study of Chilean industry and economy. Previously, President González Videla had attacked the bank publicly in a speech for its failure to assist in national economic development. Later the bank agreed to recommend a $10,000,000 loan for the mechanization of the coal industry and another $2,000,000 loan for power development. Another $10,000,000 loan for irrigation in north central Chile was postponed.

In his message to congress in May, President González Videla expressed confidence in Chile's political and economic future. He announced that the steel mill at Huachipato, built at a cost of $87,425,000, was producing 236,000 tons of steel ingots yearly; a large ore smelter at Paipote would start operating shortly; and the nitrate industry would use a solar evaporation process for treating low-grade nitrate. This would increase the exploitable reserves and lower production costs. The only menace he saw to the nation's safety was from Communist infiltration.

Diplomatic relations were renewed with Venezuela, after a break of three years. Political parties started preparations for the presidential election in Sept. 1952; former Interior Minister Pedro Enrique Alfonso won the Radical party nomination in the primary over Marcial Mora, formerly ambassador to the United States, and a five-party right-wing coalition nominated Arturo Matte. There were rumours that Gen. Carlos Ibáñez del Campo might also be a candidate. (J. Mc. Ad.)

Education.—In 1948 the public primary schools had 518,446 pupils and the private and municipal primary schools 149,802 pupils. Secondary

TIBETAN DELEGATES signing an agreement at Peking, China, May 23, 1951, giving the Chinese communist government control of Tibetan foreign and military affairs

schools had 70,622 pupils. University education was available at the state university of Chile (5,287 students), the Catholic university of Santiago (1,528 students) and the University of Concepción. In 1951 there were 410 motion-picture theatres with seating capacity of 300,000.

Finance.—The monetary unit is the peso, valued at $0.0108 U.S. currency, free market rate, on Oct. 31, 1951. The rate for imports into Chile was $0.0166 (provisional commercial), $0.0322 (official), $0.0232 (banking market), $0.02 (special commercial) or the free market rate, depending upon their relative importance to the economy. The 1952 budget, as submitted to congress, balanced revenue and expenditure at 27,832,000,000 pesos (1951 as enacted: revenue 23,257,087,125 pesos; expenditure 23,259,070,480 pesos). Actual revenue in 1950 was 18,887,000,000 pesos; expenditure, 20,637,000,000 pesos. Notes and coin in circulation on Sept. 30, 1951, totalled 7,350,000,000 pesos; gold reserve $45,100,000; sight and current deposits 14,833,000,000 pesos; time deposits 5,520,000,000 pesos; government deposits 2,240,000,000 pesos.

Trade and Communications.—Exports in 1950 (excluding gold) amounted to $282,000,000; imports were $248,000,000. Leading exports were copper bars (50%), nitrate of soda (25%) and wool (3%); leading imports, machinery and vehicles (28%), textile fibres and cloth (13%), iron and steel and manufactures (9%) and sugar and derivatives (9%). Chief customers were the U.S. (52%), Argentina (6%), the United Kingdom (5%), France (5%) and Egypt (5%); chief suppliers, the U.S. (48%), the United Kingdom (12%), Peru (7%), Argentina (5%) and Germany (2%).

The railway system totalled 5,434 mi. in 1949, of which 3,859 mi. were owned by the government. Highways (Dec. 31, 1947) included 1,785 mi. of international highway, 3,815 mi. of national highway and 26,300 mi. of provincial roads. Motor vehicles (Dec. 31, 1950) included 40,098 automobiles, 27,507 trucks and 4,164 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 88 vessels (100 tons and over) aggregating 169,349 gross tons on June 30, 1950.

Agriculture.—Production of the principal crops in the crop year 1950–51 was estimated as follows (in short tons): wheat 1,080,000; barley 97,000; oats 98,000; rice (paddy) 44,000; potatoes 396,000; (1949–50) beans 69,000; chick-peas 41,000. Production of wine in 1950 totalled 86,300,000 U.S. gallons. Livestock (1950) included 2,331,000 cattle, (1949) 585,000 pigs, 636,000 goats and 6,345,000 sheep. Wool production averages 17,000 short tons a year, lumber production about 275,000,000 bd.ft. a year and landings of fish (including shellfish) about 70,000 short tons.

Manufactures.—Manufacturing establishments were reported to number 5,585 in 1948, with capital of 1,466,587,000 pesos and 296,000 employees. There were about 375 textile mills in 1950, including 43 cotton mills, 220 knitting mills and 46 silk and rayon mills. Production figures (1950) included steel 61,655 tons; pig iron 120,688 tons; cement 565,312 tons; and woven cotton fabrics 39,500,000 yd. The index for manufacturing industries averaged 155 in 1950 and employment in manufacturing averaged 134 (1937=100). Electrical energy is used extensively; production in 1950 was 1,520,465,075 kw.hr. The cost of living index stood at 778 in Aug. 1951 (1937=100).

Mineral Production.—Chile is the leading mineral-producing country in South America. Production in 1950 included copper 399,867 tons; nitrate of soda 1,779,273 tons; mercury 23,886 lb.; manganese 37,240 tons; iron ore 3,255,349 tons; silver 740,832 troy ounces; gold 185,538 oz. Petroleum production on Tierra del Fuego totalled 100,152 cu.m. (about 550,000 bbl.) in 1950.

China.

Situated on the southeastern part of the continent of Asia and bordering the U.S.S.R. and Outer Mongolia for more than 6,000 mi., China has an area of 3,876,956 sq.mi. with 475,000,000 people (1950 official est.). Under the national government China had been divided into 35 provinces plus Tibet. The Central People's (Communist) government, which was inaugurated in Oct. 1949, divided China into six administrative districts plus the Inner Mongolian autonomy and Tibet. Under these political divisions there were 29 provinces and 8 administrative areas with provincial status plus 13 special municipalities. The Central People's government in Peking, which controlled practically all the Chinese mainland, and the national government in Taipei, Formosa, continued during 1951 to contend for the loyalty of the Chinese people and for international recognition and position.

Mao Tse-tung (*q.v.*) was chairman of the Central People's government; Chiang Kai-shek (*q.v.*) was president of the national government.

Cities with more than 1,000,000 population totalled eight, and the late 1950 official figures were: Peking, 1,940,290; Shanghai, 5,406,644; Tientsin, 1,785,813; Mukden, 1,551,317; Canton, 1,495,694; Port Arthur, 1,054,466; Chungking 1,038,683; Nanking, 1,020,000.

History.—The problem of China continued in 1951 to be a focal point in the struggle between the east and west, as the Central People's government became more involved in Korea and in soviet strategy and policy, and particularly after the United States took a firmer attitude toward Communist expansion in Asia. An invasion of Formosa by the People's Liberation forces became less likely than a year earlier and there were signs of political and economic improvement in Formosa. On the Chinese mainland, only two years after the inauguration of the Central People's government in Peking, complete organization of a new society based on the ideologies of Marx, Lenin and Mao Tse-tung to replace the traditional Chinese life of Confucian cultural pattern was virtually accomplished. The important activities and policy of the Peking government in 1951 may be reviewed under the following related and interlocked issues: resisting the United States and aiding the North Koreans; suppressing and liquidating "counterrevolutionists"; land reform; strengthening Sino-soviet friendship; eliminating imperialistic influence in China.

Following Peking's rejection of the appeal of the United Nations committee seeking a cease-fire in Korea in Dec. 1950, and to allay Communist suspicion as well as to reassure United Nations members, which feared a spread of the Korean war, Pres. Harry S. Truman declared early in January that the United States would not bomb China without U.N. authority and probably not without a declaration of war. Later in the month, against the objection of both the soviet and Chinese nationalist delegations, the political committee of the U.N. general assembly, with the United States' affirmative vote, approved a five-

"TIME TO READ THE FINE PRINT," a cartoon by Pratt published in the *Sacramento Bee* (Calif.) in 1951

point plan for arranging a cease-fire and convening a Four-Power conference, including Peking, to achieve an over-all settlement of far eastern problems. In reply Peking insisted on negotiations first and suggested adding France, India and Egypt to the conference, to be held in China. Sen. Tom Connally, chairman of the U.S. senate foreign relations committee, protested that his committee had not been consulted on such a major foreign policy decision as the latest cease-fire proposal, and U.S. Secretary of State Dean Acheson turned down and denounced Peking's counterproposal. Then the United States moved swiftly to present a resolution branding Peking an aggressor. After passage of house and senate resolutions on Jan. 19 and 23, respectively, calling on the U.N. to denounce Peking at once as an aggressor and to keep it out of the United Nations, President Truman said that his country was solidly behind him in condemning Peking. Despite India's emphatic warning, the general assembly adopted a resolution naming Peking an aggressor in Korea and requesting the collective measures committee to submit recommendations on additional measures to meet the aggression unless a new good offices committee made progress with a cease-fire proposal. Peking denounced the resolution and declared that it would have nothing to do with the good offices committee. When the general assembly's political committee met in early May to consider the fruitless efforts of the good offices committee and the recommendations of the additional measures committee, the tide of battle in Korea had been changed with the U.N. forces once more across the 38th parallel. On May 18 the general assembly adopted a resolution with a vote of 47 to 0 calling all governments to impose an arms embargo against Communist China and North Korea.

No matter how effective the arms embargoes might be, the resolution virtually barred the entrance of Peking into the U.N. for the time being. The special committee on the representation of China under the leadership of the Indian delegate established by the fifth session of the general assembly on Sept. 19, 1950, reported in Oct. 1951 that in the existing circumstances it could not make any recommendation on the question. Meanwhile, the U.S. attitude toward the national government and the Peking government became more definite. In April Robert A. Lovett, deputy secretary of defense, said Formosa ranked with western Europe in terms of priority of shipment of arms and ammunition, and the next day the state department revealed that under the Mutual Defense Assistance program aid had gone to the Chinese nationalists. Maj. Gen. William C. Chase, head of a permanent military commission, arrived in Formosa in May. In his message to congress on May 24 asking for foreign military aid, President Truman included military assistance to Formosa. About $307,000,000 was proposed for Formosa, $90,000,000 of which would go for economic aid. In defending its position, the U.S. state department released a memorandum dated Aug. 20 stating that to prevent the seizure of Formosa by a hostile force had been an unwavering policy of the United States and that U.S. aid to Formosa was expanded to include military measures. Likewise, the United States' firmer opposition to the admission of Peking into the U.N. was evidenced by Gen. George C. Marshall's statement in May before the senate hearings on the dismissal of Gen. Douglas MacArthur, Ambassador Philip C. Jessup's testimony in early October before a senate subcommittee, and statements of nine other presidential nominees for the U.S. delegation to the general assembly. In November the general assembly adopted a resolution with a vote of 37 to 11 shelving the question of seating Communist China.

The MacArthur episode revealed the U.S. strategy and policy concerning the bombing of Communist bases in Manchuria and the question of blockading the China coast and accepting the Chinese nationalist forces to fight in Korea or allowing them to invade the mainland.

On June 23, almost the anniversary of the start of the Korean war, the soviet delegate to the U.N., Jacob A. Malik, stated in an unusual radio broadcast that as a first step toward a settlement of the Korean war, discussions should be started between the belligerents for a cease-fire and for an armistice providing for the mutual withdrawal of forces from the 38th parallel. On June 25 Peking officially endorsed Malik's statement. Negotiations started in Kaesong, Korea, on July 10 but were suspended on Aug. 23. In the meantime the Communist military losses were staggering and on Oct. 23 Mao Tse-tung stated that if the United States was willing to seek a settlement in Korea on the basis of justice and reasonableness the armistice negotiations could be worked out. Two days later cease-fire talks in Korea were resumed at Panmunjom and on Nov. 27 agreement was reached on a cease-fire line, mostly above the 38th parallel, to be effective in 30 days provided agreements could be reached on the inspection-enforcement issue and the exchange of prisoners. (*See* KOREAN WAR.)

The exclusion of China from the preparation and signing of a Japanese peace treaty at the San Francisco conference in September caused bitter disappointment to the national government and brought strong protests from both the nationalists and Communists. On Sept. 3, the national government declared that any peace treaty with Japan without equal Chinese participation would not be binding on China, while Peking charged the treaty a threat to peace and an "American plot to enslave the peoples of Asia." Because the Anglo-U.S. draft peace treaty failed to include Peking and to provide the return of Formosa to it, India did not attend the conference for the signing of the treaty. The soviet proposal, before the San Francisco conference, for a Japanese treaty by the Big Four including Peking, which had the official endorsement of Peking, and the soviet unexpected representation and argument for Peking's cause at the conference produced no favourable results. Since the Anglo-U.S. compromise formula, leaving China's participation to Japan to decide after the signing of the treaty, was interpreted by the Japanese premier as granting him no actual authority to choose between the two Chinese governments, the question of China's signature to the treaty was shelved. (*See* Japanese Peace Conference.)

Peking's policy of "liberating" Tibet was carried out without a major fight. In mid-Jan. 1951 the People's Liberation army reached Chamdo, gateway to Lhasa, and in early March Peking promised the dalai lama, spiritual and temporal ruler of Tibet, who had fled to Yatung in Dec. 1950, internal autonomy for his country. Late in May it was announced that a 17-point agreement giving Peking military and political control of Tibet had been signed. In early October the People's Liberation army took full control of the roads from Lhasa to India and in November entered Gyantse, an important trading centre near India. Also in November the Tibet national assembly ratified the agreement transferring the control of foreign affairs, defense and currency to Peking. (*See* Tibet.)

Peking's endeavour in Tibet, interest in Indochina, designs on Formosa and particularly its adventure in Korea hampered reconstruction and imposed a heavy burden on China's strained economy. Furthermore, the land reform program and high taxes and the drive for donations for purchasing tanks and aeroplanes for the Chinese troops in the Korean war created discontent among various groups of the population. As a result the initial popularity of Mao Tse-tung's government began to dwindle and the country became a police state with its expanded public security bureaus, people's courts, re-education camps and family police. To tighten control and to liquidate nationalist elements, the state council promulgated in February a decree on the punishment of "counterrevolutionaries" which extended the penalties of death or life imprisonment to virtually any kind of antigovernment offense. Mass trials and wholesale executions took place in many cities. During 1951, the Peking authorities stated that from Oct. 1949 to Oct. 1950 more than 1,000,000 "counterrevolutionaries" were liquidated, while the nationalist officials in Formosa admitted that they had lost many valued agents and supporters in the purge on the mainland. On Nov. 12, 1951, T. F. Tsiang, China's chief delegate to the U.N. general assembly, formally charging the Communist rule by murder on the mainland a threat to world peace, requested the U.N. to help rid China of the new barbarism.

A dual campaign of solidifying the Sino-soviet friendship on the one hand and of eliminating the influence of imperialism (meaning most frequently the United States) on the other was intensified. The membership of the Sino-Soviet Friendship association, one of the social and cultural organizations of the Communist party, increased from 3,000,000 in 1949 to 17,000,000 in 1951. It was reported that the ranks of soviet advisers, technicians and military units in China had expanded. On the other hand, to eliminate "imperialism masquerading under the cloak of religion" the Peking government assumed in January the role of direct supervisor of all foreign-supported educational, cultural, charitable and religious institutions in China, and in July ordered all Chinese Christian churches and organizations to sever immediately relations with foreign missions. Many missionaries were forced to leave and a number of Europeans, Americans and Japanese were arrested on charges of spying for the United States.

For security reasons disclosure of any information which might be regarded as confidential was subject to punishment. Practically speaking, neutral sources of information became nonexistent, and financial and economic statistics became guarded state secrets. (*See* also Communism; Formosa; India; Korea; Union of Soviet Socialist Republics; United Nations.)

Education.—Official figures placed the numbers of schools and their enrolments on China's mainland in 1951 as follows: 227 colleges and universities with 134,000 students; 4,115 secondary schools with approximately 1,300,000 students; 400,000 primary schools with about 37,000,000 pupils. A new educational system with special emphasis on workers' and peasants' education was adopted in 1951 under which a five-year elementary education course together with various supplementary schools replaced the six-year process in the old system, more vocational and technical schools were provided for rural and labouring students, and the intellectuals of the old regime were to be reoriented with revolutionary education.

Defense.—About 200,000 of the nationalist forces on Formosa, estimated to total 500,000 to 750,000, were believed to be well trained and equipped. The nationalist navy had about 100 small vessels with 43,000 men, and the nationalist air force consisted of more than 300 mostly worn out and obsolescent planes. The Communist air force grew steadily and by the end of 1951 it was estimated to have more than 1,000 soviet-made planes. The People's Liberation army totalled about 5,000,000, of which more than 2,500,000 were well-trained standing forces. Military expenditure occupied a greater part of the nationalist and Communist budgets in 1951.

Finance.—Neither the size nor the composition of the 1951 budget was revealed by the Peking government and even 1950 percentage figures were missing from the year's budget announcement. It was believed that the 1950 actual budget deficit was 58% instead of 18.7% as officially announced. High taxes and campaigns for contributions and donations including ransom money from the overseas Chinese could meet only a small fraction of the 1951 deficit. However, basic living costs were fairly stable. In Formosa, final returns of the national treasury for 1950 showed a deficit of about 26% as compared with the 85% deficit of 1949. Despite economic and financial improvements, Formosa had to depend on Economic Cooperation administration aid from the U.S. to maintain its economy and offset the budget deficit. The official rates of exchange of the Formosa dollar and the People's bank dollar were about 15 and 35,000 to U.S. $1, respectively.

Trade and Communication.—On the mainland, state enterprises had a complete monopoly of the export of bristles, soybeans, metals and ores, and handled a large part of the export of such principal commodities as salt, coal, silk, tea, oils and fats, furs and skins. Imports of machinery, equipment and materials needed by government organizations and private factories were largely handled by state organizations. After 1949 statistics on the total value of trade had not been available. It was officially claimed that trade in 1950 increased over that of 1949. A greater favourable balance of trade was achieved with exports exceeding imports by more than 9% for the first nine months of 1951. In 1950 imports from the U.S.S.R. were about 20% of China's total foreign imports and by Sept. 1951 they had increased to more than 44%. China's exports to the U.S.S.R. increased from about 26% in 1950 to about 51% in the first nine months of 1951. Imports from "capitalist countries," which were still as high as 78% in 1950, had declined to about 29% by Sept. 1951.

Nearly all the railway lines on the mainland and on Hainan Island, totalling about 14,000 mi., were open to traffic. The Nanning-Chennan-Kuan line of more than 100 mi. was completed and the construction of new lines included the Chungking-Chengtu railway of about 300 mi. and the Tiensui-Lanchow railway of about 200 mi. Highway transportation and the telephone and telegraph systems had not resumed their prewar position.

Agriculture, Manufactures, Mineral Production.—Redistribution of land under the land reform program, which was regarded as a necessary counterpart of the process of revolution, was completed in areas with a total rural population of more than 300,000,000. According to the official report, China's grain production increased from 112,000,000 tons in 1949 to 120,000,000 tons in 1950, and the total food output in 1951 was expected to exceed the 1950 record. The Peking authorities claimed that China had achieved self-sufficiency in grain and for the first time could export large quantities of surplus grain. Major industries were mainly state enterprises. It was officially declared that 1950 production of heavy industry was greater than that of 1949 and that during the first half of 1951 the heavy industries showed a 44% increase over the same period in 1950.

Christian Science.

Christian Science is the religion discovered and founded by Mary Baker Eddy in 1866. It is represented by the Church of Christ, Scientist, and consists of the Mother Church, the First Church of Christ, Scientist, in Boston, Mass., and its branches in the U.S. and 41 other countries throughout the world. Organizations established in accordance with the bylaws of the Mother Church were in 1951 also located at more than 100 universities and colleges.

Steady growth of the denomination for more than half a century was indicated at the year's annual meeting when the all-time peak of 3,049 branch churches and societies was announced.

Relief activities conducted on a world-wide scale during 1951 helped to alleviate food and clothing shortages in disaster areas. Substantial relief went to 15 nations, not including a gift of plows to India from churches in the U.S.

The Communist authorities of east Germany banned Christian Science and closed the churches in March 1951.

To keep pace with increased military preparedness in the U.S., Christian Science camp welfare activities were expanded. By Aug. 1951 there were 12 Christian Science chaplains on active duty with the armed forces, including one in the Korean combat zone. Civilian workers were assigned to call at many military posts and hospitals.

Growing public interest in religion was reflected in increased demand for Christian Science books and periodicals. Sale of the Christian Science textbook, *Science and Health with Key to the Scriptures,* by Mrs. Eddy increased 25% in a year's time. The total demand for all her writings was double that of ten years earlier. Daily, weekly, monthly and quarterly publications also reached new circulation peaks.

Christian Science lecturers, members of the board of lectureship of the Mother Church, toured the orient, Alaska, Australia, New Zealand, Africa, continental Europe, the British Isles, Mexico, Cuba, Bermuda, the West Indies, the Canal Zone, South America, the United States and Canada. They reported healings of lameness, deafness, blindness, cancer, sin, sorrow and other problems as taking place at lectures. (GE. C.)

Christian Unity. Progress toward organic union, most convincing evidence of vital unity, though retarded in 1950, bettered in 1951 the century's average rate of one per year. New unions were the Federacao Sinodal (four Lutheran bodies), Brazil; and the Presbyterians, merging Northern and Southern Churches in Formosa. In the Netherlands, the Evangelical Reformed and Restored Lutheran Churches united. The two first-mentioned united bodies, likewise the newly formed Anglican Church of the Province of West Africa and the Russian Orthodox Greek Catholic Church in North America, all applied for membership in the World Council of Churches which by the close of the year enrolled 158 churches in 43 countries. (The Anglican Chinese Church withdrew under Communist pressure.)

Negotiations for administrative or organic union progressed elsewhere: in Australia, between the United Evangelical Lutheran and the Evangelical (Missouri synod); in Tanganyika, between several Lutheran churches; in Nigeria, a joint union committee sought merger of Anglicans, Methodists and Presbyterians; in Ceylon, Anglicans, Methodists and Baptists neared final agreement; in India, following much the same plan, the Church of North India, itself embracing merged Anglicans, British and Australian Methodists, proposed a United Church with Congregationalists, Presbyterians and other Methodists, with Baptists as observers, on the basis of a definite constitution drawn in 1948. Elsewhere in India, Lutherans neared reunion. Indonesian Protestants of four types in May decided formally to continue a close union and to work for a united church of all Indonesia. South Indian Baptists and Lutherans were considering joining the Church of South India, already the most diverse union in existence and the largest non-Roman body in Asia. The Netherlands reported an all-but-completed merger of two Lutheran Churches. In the United States, three major Presbyterian bodies were presented a new proposal for merger by the Cincinnati assembly of the Presbyterian Church in the U.S.A. (northern). Also in the U.S., full consultation officially contemplating union brought together five Lutheran bodies—the American, Augustana, Evangelical, Free and United. U.S. Baptists and Disciples of Christ planned simultaneous national conventions in Chicago in 1952 as an aid to merger.

Elsewhere negotiations for mutual recognition not involving organic union progressed: in Australia, Anglicans, Congregationalists, Methodists and Presbyterians continued conversations; in Canada, the Anglicans and the United Church (originally Congregational, Methodist and Presbyterian) resumed consideration of intercommunion; in the United Kingdom, on the proposals embraced in "Church Relations in England" (Anglican-Free Church); and in Scotland, where a new plan of unified ministries was published. Likewise in London, a solemn covenant of fellowship was officially signed by Congregationalists and Presbyterians. In the U.S., eight Protestant bodies of major significance continued at Cincinnati the definite planning for a United Church of Christ proposed by the so-called "Greenwich (Conn.) conference" of 1949. A federation of the Hungarian, Slovak, Croatian and Slovenian Lutheran groups in Yugoslavia was formed. The Universalists and Unitarians (U.S.) reported more progress toward merger.

United facilities for theological education were set up in a number of places around the world, continuing a growing trend. The united Japan Christian university, supported by 13 North American denominations, elected its faculty and completed its central buildings at Mitaku near Tokyo.

National church councils everywhere recorded progress. A new one embracing Anglicans and Presbyterians was launched in Iran, and the one in Japan expanded its work. Two-thirds of the Protestants in Japan were represented in the United Church which was linked by the National Church council to nonmember bodies. Indonesia also announced a new National Church council with 30 member bodies. The North Celebes Regional council of five churches, and an Indonesian council of Chinese churches, with 11 denominations participating, also made their bows.

The National Council of the Churches of Christ in the U.S.A., launched in late 1950, began its task of integrating the work of the antecedent dozen agencies which it consolidated, and held its first annual meeting in Atlanta, Ga., in November. The total number of autonomous local, state and regional councils related to it functionally was 927, of which 217 had paid staffs.

Even the National Christian council of China continued to function, although, under extreme nationalist and Communist pressure, it ceased to have communication with similar bodies in other lands.

The Protestant churches inside and outside the ecumenical movement in America were aroused and united by U.S. and Canadian government moves toward Vatican diplomatic representation. In each nation, the Council of Churches took immediate and strong official action, the National Council of the Churches of Christ in the U.S.A. calling a special session for the purpose and organizing a nation-wide move to block the action sought by the government.

In the Netherlands, an eighth denomination—the Moravians—joined the Dutch Council of Churches; and in India, the Missouri Lutherans and certain Holiness and Pentecostal groups came into the National council. Even the conservative Evangelical Fellowship of India permitted its fundamentalist constituency to remain in the provincial and national ecumenical organizations.

In Woudschoten, Neth., a new world body known as the World Evangelical fellowship was organized. It largely comprised individuals concerned for a certain conservative type of theology. While at points highly critical of the ecumenical movement, at other points it approved ecumenical action for a higher degree of Christian unity.

While not involving church union, a great expression of unity was seen in the Kirchentag in Berlin, attended by 400,000 persons from all non-Roman churches and all zones (*see* RELIGION), and the same was true of the celebration in Greece of the 1,900th anniversary of St. Paul's arrival in Athens. Broadly inclusive plans made by the Greek Church brought together many Eastern Orthodox, Old Catholic, Anglican and Protestant leaders from many lands and stressed the growing community of interest uniting diverse churches.

The World council's central committee met in Rolle, Switz., in August. Plans were consummated at that, and at a succeeding meeting in Clarens, Fr., of its Commission on Faith and Order, for a third world conference on the theme "Faith and Order" at Lund, Swed., in 1952. The World Council of Churches and the International Missionary council sponsored a consultation in Beirut on the plight of Arab refugees and produced notable recommendations to the United Nations and to the churches.

The annual consultation sponsored by the World Council of Churches' department of interchurch aid and service to refugees met in Geneva in October and laid plans for meeting acute need in six critical areas—Trieste, Greece, Palestine, Turkey, Shanghai and Samar. Because of the imminent termination of the International Refugee organization, new burdens were seen forced on the united voluntary agencies of the churches.

The World Council of Churches' first European Laymen's Study conference met at Bad Boll, Ger.

Anglican orders were granted to the Aglipayan Church in the Philippines, a nationalist split from Roman Catholicism. This church belongs to the Federation of Christian Churches (P.I.). (*See* also RELIGION.) (H. S. LR.)

Chronology: *see* CALENDAR OF EVENTS, 1951, pages 1–16.

Churchill, Winston Leonard Spencer

(1874–), British statesman, was born at Blenheim palace, Oxfordshire, Eng., on Nov. 30. For his biography and political career during World Wars I and II, see *Encyclopædia Britannica.* After the defeat of his government in the general election of 1945 he led the Conservative opposition in the house of commons.

In a party political broadcast on March 17, 1951, Churchill said that the Conservative party had decided, on national rather than party grounds, to bring about a general election as soon as possible. He signed the Conservative party election manifesto which was issued on Sept. 29 and gave an election broadcast on Oct. 8. He was re-elected for Woodford, Essex, with a majority of 18,579.

Churchill was received by King George VI on Oct. 26 and kissed hands on his appointment as prime minister and first lord of the treasury; his cabinet was announced on Oct. 26, 27 and 30 (*see* CABINET MEMBERS); he retained for himself the post of minister of defense. When parliament opened on Nov. 6 Churchill underlined the gravity of the country's economic position. In the defense debate in the house of commons a month later he said that the theme of the government's policy would be the idea of deterrents rather than the idea of danger. He visited Paris with Anthony Eden, Dec. 17–19, to explain to the French ministers the point of view he would put forward in talks that had been arranged for him in Washington, D.C., in Jan. 1952. Discussions with René Pleven and Robert Schuman dealt with the North Atlantic Treaty organization, Germany, the near east and the far east. He sailed from Southampton on the "Queen Mary" on Dec. 31 for his talks with Pres. Harry S. Truman and for a visit to Ottawa, Ont.

The fourth volume of his memoirs of World War II, *The Hinge of Fate,* was published in London in August. (R. JAN.)

Church Membership.

The latest information concerning church membership in the 256 religious bodies in continental United States, appearing in the *Yearbook of American Churches* (New York, 1951), indicates that there were 86,830,490 persons in 281,511 local churches or congregations. The figures were mainly for years ending in 1950. This compared with 81,862,328 members reported by the *Christian Herald,* New York city, about a year earlier. There were 66 religious bodies reporting more than 50,000 members in 1951

Table I.—*Church Membership in Continental United States, as Reported in 1951, for Religious Bodies with More than 50,000 Members*

Body	Members 1951	Members 1950
Adventists, Seventh Day	237,168	229,945
Assemblies of God	318,478	275,000

‡Includes the Philippine Islands.
§This figure includes Asiatic U.S.S.R. and Turkey.

(*see* Table I), and their total membership was 85,254,619, or more than 98% of all members of religious bodies.

The remaining 2% was thus found in the 190 smaller bodies of the nation.

Church membership, officially reported, had been increasing for many years, as had also the proportion of church membership in the total population. Church members were about 57% of the population. Since 1926, the date of the last adequate census of religious bodies made by the bureau of the census, church membership had increased more than 50%, while the estimated population increased about 30%. However, nothing was known about church attendance or other participation, or the proportion of church members contributing.

The Church of Christ, Scientist, does not report membership because a regulation of that body forbids the numbering of the people and the reporting of such statistics for publication.

In 1950 about 58.5% of church members were classified as Protestant, 33.2% Roman Catholic, 5.8% in Jewish congregations and 2.5% in all other bodies including Eastern Orthodox and Old Catholic. (B. Y. L.)

Principal Religions of the World.—Statistics of the world's religions are only very rough approximations. Aside from Christianity, few religions, if any, attempt to keep statistical records; and even Protestants and Catholics employ different methods of counting members. All persons of whatever age who have received baptism in the Catholic Church are counted as members, while in most Protestant Churches only those who "join" the church are numbered. The compiling of statistics is further complicated by the fact that in China one may be at the same time a Confucian, a Taoist and a Buddhist. In Japan, one may be both a Buddhist and a Shintoist. (C. S. B.)

Civil Aeronautics Administration.

During 1951 there was an improvement in the safety record of scheduled U.S. international air carriers. The combined international and domestic record equalled the one set in 1950, but the domestic record did not. There was a decided increase in the number of revenue passenger-miles, both domestic and international, as well as in the number of all types of pilot certificates issued, but a decline in the number of civil aircraft manufactured.

The fatality rate in 1951 for every 100,000,000 passenger-mi. of domestic and international flying by the scheduled air carriers was estimated at 1.3, the same as the rate for 1950. In domestic operations the estimated fatality rate was 1.4, compared with 1.1 in 1950. In international operations the rate decreased from 2.1 in 1950 to an estimated 1.2 in 1951.

Revenue passenger-miles flown by domestic scheduled carriers increased 32%, from 8,002,825,000 in 1950 to an estimated 10,564,000,000 in 1951. Revenue passenger-miles flown by international scheduled carriers increased 16%, from 2,206,396,000 in 1950 to an estimated 2,559,000,000 in 1951.

Ton-miles of freight carried by domestic scheduled carriers decreased by an estimated 6% while ton-miles of express increased by an estimated 32% in 1951. Express and freight ton-miles in international operations increased by an estimated 17%.

During 1951 an estimated 55,000 student pilot certificates were issued, an increase of 23% over 1950. Private certificate issuances totalling an estimated 27,000 were greater by 4%, commercial certificate issuances totalling an estimated 5,600 were greater by 9% and air line transport pilot certificate issuances numbering an estimated 1,220 were greater by 50%.

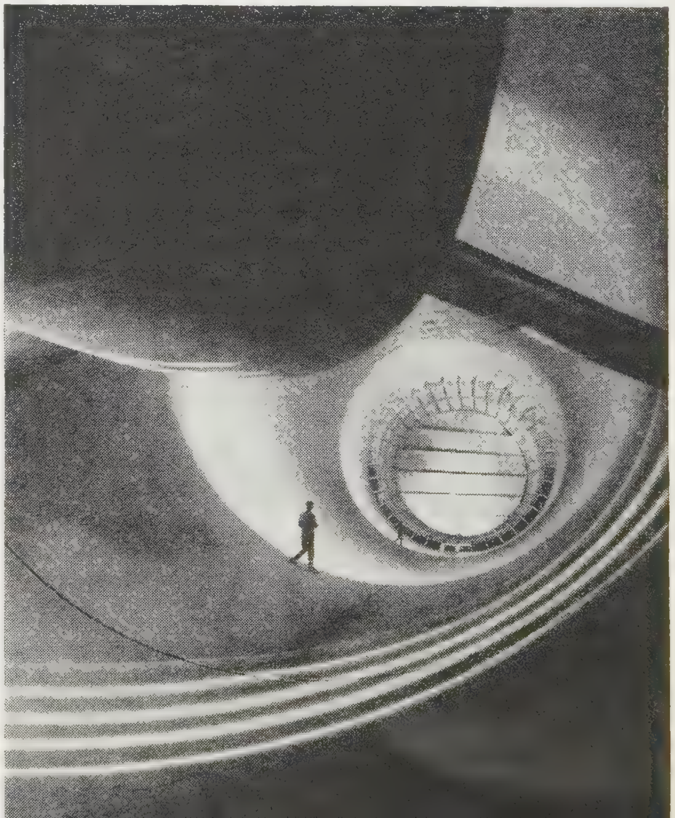
An estimated 2,700 civil aircraft were manufactured in 1951 as compared with 3,520 in 1950.

There were no fatal accidents in irregular air carrier operations during the first ten months of 1951.

On June 30, 1951, the end of the fifth year of the Federal Aid Airport program, a total of $166,537,603 in federal funds had been programmed, of which $162,194,067 had been put under contract. Funds had been granted to 1,952 projects, of which 410 were under construction, 1,295 had been completed and 247 were being processed for construction.

Substantial progress was made in implementing the common system of air traffic control and navigation. At midyear, of the

AIR-RETURN PASSAGE in the 16-ft. trans-sonic wind tunnel at Langley Aeronautical laboratory near Hampton, Va., one of three research centres maintained by the National Advisory Committee for Aeronautics in 1951



approximately 400 VOR (very-high-frequency omnirange) facilities required to cover the United States, 305 had been fully commissioned and 11 others were operating on a test basis. Ninety-eight instrument landing systems (ILS) were in operation. Nine airport surveillance radar (ASR) systems and nine precision approach radar (PAR) facilities were in operation at Boston, New York International and LaGuardia, Newark, Washington National, Atlanta, Chicago Midway, Cleveland and Los Angeles airports.

The two types of radar, when used together, constitute a ground controlled approach system.

International implementation of the United States-developed common system also made good progress. More than 30 instrument landing system installations were in operation in the European area. VOR facilities had been commissioned at London and Wales. DME (distance measuring equipment) was operating at London, Paris and Ostia, near Rome. The Lorenz company of Berlin was building eight military VOR installations in Germany, one of which was in operation at Stuttgart.

Technical aviation assistance under economic and military aid programs was furnished to 11 foreign countries, thus contributing to Point Four and Economic Cooperation administration program objectives of economic development.

Fire testing of XR60-1 and XB-45 engine installations was completed which provided design requirements for fire detecting and extinguishing systems and established correct crew procedures in the event of fire in flight. A miniature omnirange, suitable for installation at an airport and to serve as a terminal aid, was developed and successfully tested at a number of airports.

Assistance was given to the Federal Civil Defense administration in formulating plans for the use of civil aircraft in civil defense.

Discussion was carried on with aircraft manufacturers concerning certain turbine-type engines which they were considering for use in civil transport aircraft. One civil transport aircraft was equipped with a turbine-propeller power plant and was flying on an experimental basis. Twenty-four new engine models ranging in power from 90 h.p. to 3,500 h.p. were approved. Major type certification projects during the year included the Douglas DC-6A and DC-6B models.

Work on the agricultural aeroplane, AG-1, which was completed and successfully test flown in Dec. 1950, continued. The aeroplane was demonstrated over much of the United States and many aerial applicator pilots flew it for evaluation purposes. The design, construction and testing of the dispensing equipment was to be completed at Texas Agricultural and Mechanical college.

The federal government adopted a policy of intensified support of commercial transport helicopter development, as the result of a study and report made by Pres. Harry S. Truman's air co-ordinating committee during the year. It was found that the military development and use of transport helicopters had advanced to the point where effective utilization of large multi-engined rotary wing aircraft on short-haul air line routes could be foreseen. The report called upon the post office department to continue the use of helicopters in expediting terminal handling of mail in the Los Angeles and Chicago areas. (*See* also AIRCRAFT MANUFACTURE; AVIATION, CIVIL.)

FILMS OF 1951.—*Behind the Scenes at the Airport* (Carl F. Mahnke Productions). (B. M. St.)

Civil Defense, U.S.

Civil defense is a major part of the United States national defense program. Operated by civilians under civilian authority, its mission is to minimize casualties and damage from enemy attack and to preserve maximum civilian support of a war effort. It is based on the principles of self-protection and of mutual assistance as they apply to individuals, groups, communities, states and even nations.

After World War II Pres. Harry S. Truman instructed the department of defense to study the subject of civil defense. Upon its recommendation, responsibility for planning civil defense was transferred to the national security resources board. This board, after writing a basic national plan, recommended that a separate agency be established to carry it out.

The Federal Civil Defense administration (FCDA) was created and established in the executive branch of the government by the Federal Civil Defense act of 1950, approved by the president Jan. 12, 1951 (public law 920).

The Federal Civil Defense administration is charged with planning the details of the civil defense of the nation and giving assistance to the states in carrying out the plan. This assistance includes funds for equipment and supplies needed in a disaster on a 50% matching funds basis. The federal agency also provides guidance, advice, technical training material and materials for public education.

Other responsibilities of the FCDA are: warning state and local civil defense organizations of impending attack; the stockpiling of medical, engineering, welfare and other supplies needed for postdisaster operations; the operation of schools for training civil defense administrators and instructors in techniques required for operations; and establishing standards for equipment and supplies.

In event a state of civil defense emergency is declared by congress or the president, the administrator and his deputy have broad emergency powers. They can press into service such federal and private facilities and manpower as are required for emergency operations.

Civil defense operations are a state responsibility to be conducted with volunteer workers supervised by full-time civil defense staffs. During 1951 all states and most major cities had established civil defense directors and staffs and recruited more than 1,000,000 volunteer workers. It was estimated that 15,000,000 volunteers were required for a full-scale civil defense program.

In this period the states and territories appropriated $177,285,221 for civil defense, $64,792,459 of which sum was for matching federal contributions. In the same period congress appropriated $111,650,000, of which sum $32,750,000 was for matching purposes.

The year saw the signing of pacts among 13 states for mutual assistance in the event of an emergency. Forty-one states had statutory authority to sign pacts with other states. The United States and Canada signed an agreement whereby the facilities of each would be available to the other for civil defense purposes.

During 1951 the FCDA operated three schools: the Staff college at Olney, Md., the Central Training centre at Stillwater, Okla., and the Western Training centre at St. Mary's college, Calif. Numerous technical manuals and bulletins were issued to assist the states in the organization of their defense. Comprehensive public education programs were carried on through the publication of more than 30,000,000 copies of booklets on self-protection; through information carried by the press, magazines, television shows and radio programs; and through liaison with national organizations.

Civil defense operations would be carried on by ten services: rescue, staff, transportation, communications, welfare, engineers, fire fighting, police, health and warden.

The FCDA administrator in 1951 was Millard Caldwell, former congressman and governor of Florida. His deputy was James

Civil Service.

United States.—During 1951, events in the public service were influenced by two dominant forces—the accelerated program of national defense and the attendant impact of inflation on the cost of living. As these forces gained momentum during the year, their effects were felt in all government circles, largely in terms of increased difficulty in recruiting, higher rates of turnover and insistent demands by public employees for pay increases.

In the executive branch of the federal service, where the stepped-up defense program created large demands for staff, employment figures climbed steadily during the first half of the year. At the beginning of the year, total civilian employment was 2,181,000. By midyear this number had increased to 2,506,000. During the remainder of the year, federal employment levelled off at the midyear mark, however, partly because of budgetary limitations imposed by congress.

Of the numerous federal departments and agencies, the three largest were the department of defense, the post office and the Veterans administration. Together these three accounted for more than 75% of all federal employees. (*See* also Government Departments and Bureaus.)

In comparison with the federal service, public employment in state, county and municipal governments throughout the United States remained fairly stable throughout the year. Losses to the armed forces and to expanding war industry increased turnover rates in these quarters, and citizen pressure for budgetary economies largely offset demands for expansions in functions or staffs.

Many government legislative bodies approved pay increases for public employees during the year. This was particularly true in state governments, where state legislatures meeting in biennial sessions during 1951 had their first opportunity to act on pay increases for state employees since the Korean war began. The general average of these pay increases was in the neighbourhood of 8%, although in some instances the percentage increase was somewhat higher. During the year congress voted salary increases for federal employees, ranging from a minimum of $300 to a maximum of $800 a year. A separate measure provided a flat $400 per year increase for postal employees, together with increases up to $800 per year for postal officials in the higher brackets.

At the same time congress revised and reduced the amount of annual leave of federal employees. The new leave plan provided a basic yearly allowance of 13 days of vacation leave, with graduated increases based on length of service. The new plan also provided a separate allowance of up to 13 days per year for sick leave. The former policy gave employees 28 days of leave annually to be used both for vacation and sickness.

Mounting labour shortages over the country caused government personnel agencies to revise World War II recruiting policies and personnel utilization programs in many localities. Periodic civil service examinations were replaced by "spot" examinations as applicants became available. Several public jurisdictions experimented in the employment of women in jobs traditionally filled by men, and increased attention was given to the employment of persons with physical handicaps.

New civil service legislation adopted during the year extended the merit system in some localities, and in others revised existing civil service systems. The new Philadelphia, Pa., city charter adopted during the year strengthened and extended the city's civil service system. Consolidation of city and county government functions in Atlanta and Fulton county, Ga., included provision for the establishment of a single uniform pay schedule for city and county employees. In Rhode Island the previous independent civil service agency was replaced with a new department of administration which consolidated the personnel agency with the state's finance agency. In Arlington county, Va., and St. Louis county, Mo., new legislation provided for the establishment of civil service programs for county employees, and in Omaha, Neb., two separate city personnel boards were consolidated. (*See* also Municipal Government.)

(J. J. Dn.)

Great Britain.—In January and July 1951 two important changes were made in the structure of government. First, certain functions of the ministry of health relating to local government were taken from that ministry and combined with those of the ministry of town and country planning, which was renamed the ministry of local government and planning. Second, the ministry of materials was created by the transfer of certain responsibilities from the board of trade and the ministry of supply.

When Winston Churchill formed his government after the general election of Oct. 1951, the following further changes were made: The lord president of the council was given general oversight over the activities of the ministry of food and the agriculture departments, and a new post was created of secretary of state for the co-ordination of fuel and power and transport. A minister of state was appointed to assist the secretary of state for Scotland. The home secretary was given special responsibility for Wales; the paymaster general was given responsibility for the supervision of atomic energy research and production. The title of the minister of local government and planning was changed to minister of housing and local government and one minister was appointed to take charge of the ministry of transport and the ministry of civil aviation.

Two committees reviewed the pay and organization of engineers, architects, surveyors and allied professions in the civil service, and the pay and organization of medical officers. The total nonindustrial staff of the civil service rose from 675,400 in Oct. 1950 to 685,447 in Oct. 1951. (E. E. Bs.)

Clay Products: *see* Ceramic Products.

Cleveland.

Cleveland, O., had a population of 914,808 by the federal census of 1950. Its area is 73.1 sq.mi.

Winning his fourth consecutive two-year term as mayor, Thomas A. Burke (D.) outran Juvenile Court Judge William J. McDermott (R.) in the Nov. 6, 1951, election. Democrats also retained control of the city council. Voters endorsed amendments to the city charter which removed the police chief from civil service job protection and changed the method of hiring unskilled labour.

Sworn in on Nov. 12 for his new term, Mayor Burke announced his decision to proceed with an extensive urban rehabilitation program without waiting for a court test of the law under which land for housing projects could be acquired. Work was begun in December on the long-planned rapid transit system for the city after the Reconstruction Finance corporation lent $29,500,000 for that project and for modernization of the entire transit system. Announcement was made that a $34,000,000 supersonic wind tunnel would be built at the Lewis Flight Propulsion laboratory at Cleveland Hopkins airport, increasing the federal government's investment there beyond the $150,000,000 mark.

The city council unanimously voted pay increases totalling more than $1,000,000 annually for large groups of city employees, including police and firemen. Cleveland, according to the International City Managers association yearbook, operated more utilities in 1951 than any other city in the United States.

The utilities were a public auditorium, bus system, street railway, light plant, incinerator, sewage treatment plant, waterworks and airport.

Gen. Douglas MacArthur was welcomed by 250,000 persons when he visited the city in September and 10,000 heard him speak in Public hall. Bingo halls were closed by the mayor after Common Pleas Judge Frank J. Merrick ruled the city's bingo licensing law was unconstitutional. The demand for electrical power continued to grow and on Nov. 8 the peak load of the Cleveland Electric Illuminating company went over 1,000,000 kw. for the first time. The community chest raised $6,504,113, largest amount in its history, for city charities. A need for parking spaces for an additional 12,275 automobiles in the downtown section was found in a survey made by the City Planning commission.

Estimated expenditures of the city for 1951 were $37,329,140. The provisional budget for 1952 was $39,523,998. (P. By.)

Climate: *see* METEOROLOGY.

Clothing Industry.

The year 1951 was one of recession in the clothing industry. Consumer resistance to high prices, particularly in men's wear, caused unit sales to drop with a consequent fall in production at factory levels. Many factories operated only part time, especially in the work clothing field. Military orders were not of a scale substantially to affect the industrial picture.

Price controls held textile costs in hand but minor wage increases were granted. The world-wide wool shortage was reflected in the high price of woollens and worsteds, and there was a shortage of tropicals. Synthetics took an increasing share of the market; new fibres such as orlon and dacron entered the men's suitings field strongly competitive on a price basis. Despite shortages, the wool industry endeavoured to keep its traditional place in men's wear by active publicity campaigns. At the end of the year this consisted of an industry-wide drive to sell quality clothing.

Despite reluctance on the part of clothing manufacturers to expand, several large highly efficient factories were opened during the year. Machinery sales fell drastically throughout the entire world. Manufacturers of apparel hesitated to invest in new machinery as product sales declined. Nevertheless machinery research continued with new models being offered in sewing, cutting, pressing, creasing and cloth laying machines. These included a new powerful, fast self-sharpening cutting machine; automatically lubricated special sewing machines for a variety of purposes on work, dress and woollen clothing; a new button sewing machine of British make; and a number of new air operated pressing and creasing machines. Special sewing machines made in England and Italy were offered in the United States in competition with machines of United States manufacture. The Singer Manufacturing company celebrated its 100th anniversary commemorating the introduction of the first practical sewing machine.

The sale of embroidery machines spurted as that decorative art again came into fashion.

Style changes in men's dress tended in two directions. On the one hand, colour was widely used, a trend toward plaids receded somewhat but figures and solid colours gained. On the other hand, a conservative trend in regular men's clothing was noted, with narrower shoulders and narrower trouser cuffs. Colour was the keynote in sportswear, and sportswear was a larger factor than ever. Late in the year brushed rayon sweater sets appeared, highly combustible garments, which led to widespread investigation.

COCKTAIL DRESS shown to U.S. buyers at Florence, It., in July 1951, during the first large-scale showing staged by Italian fashion designers

Changes appeared in military garments. Following research, the United States armed forces adopted highly specialized clothing for various purposes. A sponge type undergarment was in the final stages of perfection. New developments, stressing dead air space, were used in cold climate garments. Pressure flying suits for high altitudes were used.

The industry became exceedingly price conscious because of the high cost of labour and materials and high taxes. Manufacturers attempted to cut costs, but often found it difficult to maintain quality. Such minor items as the substitution of pressed-on heat-sealed labels in lieu of sewed-on labels were indicative of the trend.

In France and the Low Countries, production dropped abruptly in midyear, for the first time since World War II. In Britain production was held down by the austerity program. Canada's clothing industry boomed along with all Canadian industry. New factories were set up in Korea by the United Nations to clothe military personnel.

A shortage of dollars held down sales of United States machinery and finished clothing abroad.

The women's wear industry stressed cotton and synthetic garments with eye appeal at low consumer prices. Suits in woollens and synthetics were in demand for high style as well as mass markets.

(*See* also FASHION AND DRESS.) (S. L. S.)

Coal. World production of coal increased 6% in 1950 to the highest level attained since 1944. All of the major producers and most of the intermediate group shared in the increase; the declines were relatively small and had little effect on the total. Almost half the total increase was in the United States. Table I shows the production in countries whose outputs are in excess of 10,000,000 tons as reported by the U.S. bureau of mines; these 19 countries account for about 96% of the world total, and the four major producers (United States, Germany, U.S.S.R. and United Kingdom) account for nearly three-quarters.

United States.—Table II covers the salient features of the coal industry in the United States and Table III the output by states, as reported by the U.S. bureau of mines.

Production increased by 16% in 1950, but failed by a large margin to offset the 30% drop from the high of 1947. In 1951 bituminous production continued to increase but at a reduced rate, and anthracite declined. Output through Dec. 8, 1951, was 501,814,000 tons of bituminous and 38,865,000 tons of anthracite, a total of 540,679,000 tons, as compared with 479,066,000 tons of bituminous, 41,684,000 tons of anthracite and a total of 520,750,000 tons in the corresponding period of 1950.

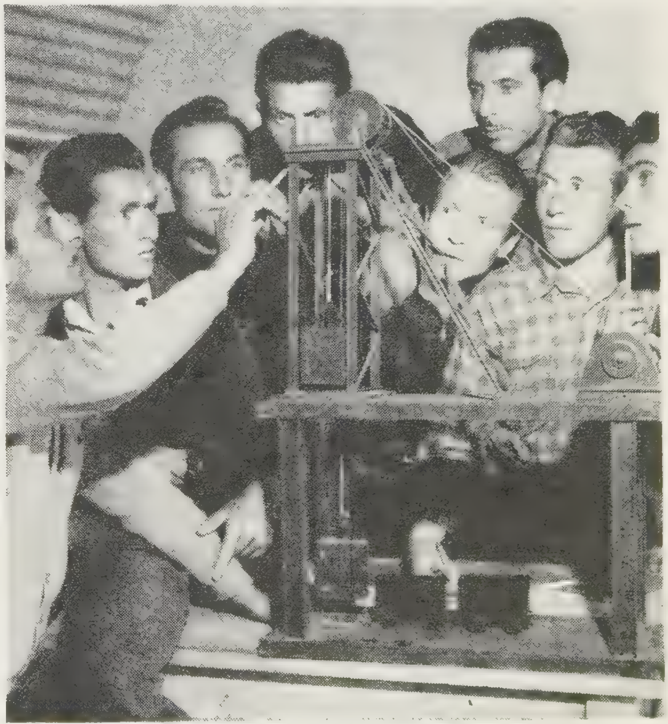
Canada.—Coal production increased from 19,120,040 short tons in 1949 to 19,135,430 tons in 1950, and heavy demand raised imports from 20,044,619 tons to 27,228,803 tons.

(G. A. Ro.)

Great Britain.—The production of deep-mined coal in 1950 was 204,100,000 metric tons and of opencast coal 12,200,000 metric tons, making a total of 216,300,000 metric tons. For 1951 the totals were: deep-mined coal 211,100,000 metric tons and open-cast 10,990,000 metric tons, a total of 222,100,000 metric tons. The National Coal board was, on several occasions during 1951, subjected to severe criticism, the chief complaint being that the board itself with its headquarters staff retained too tight a control on operations in the divisions and tended to stifle initiative. Other comments were that the powers of the colliery manager were being undermined by the creation of too many advisers at all levels.

Several large new ventures were started during the year, of which the following are examples. A new colliery designed to raise 1,000,000 tons a year from seams lying under the Firth of Forth was started. It would replace the Kinneil colliery, which for many years had worked the shallower portions of the seams. Approval was given to spend £7,500,000 on a new anthracite colliery near Swansea. It was expected that 1,000,000 tons of high-grade anthracite would be raised yearly from a depth of 2,000 ft. and that reserves would be available to last 100 years. It was believed that much of this coal would be exported to the United States and Canada. One large coking and by-products plant came into operation during the year and orders were placed for another, costing £8,000,000, to carbonize 750,000 tons a year near Chesterfield. It was intended that this plant should incorporate all the most recent European and U.S. innovations. When completed it was expected to be the most up-to-date coking and by-products plant in the world.

Pit head prices moved upward twice during 1951 and coal was



ITALIAN MINERS learning English technical terms from a model of a lift shaft and cages. They went to England in 1951 to work in British coal mines and are shown at a National Coal board instruction centre

8*s.* to 10*s.* per ton dearer at the pit head than in 1950. Bunker coal was also increased by £1 per ton. These pit head increases were largely the result of increased wages and benefits to miners which had not been counterbalanced by increased production or better attendance.

During 1951, the output of deep-mined coal rose slightly and the output per man shift was improving. On the other hand, great difficulty was being experienced in maintaining the level of manpower. Attempts were made to introduce foreign labour, of which there was a fair supply available, but some of the British miners objected to this system of recruitment. Some Poles and a few Italians were absorbed and were proving satisfactory. Coal was being imported into Great Britain during 1951 from the U.S., India and Nigeria, and the cost was high.

(J. A. S. R.)

Coast and Geodetic Survey, U.S.

During 1951, this bureau of the department of commerce continued the survey of coastal waters, the production of nautical and aeronautical charts for marine and air navigation, and the establishment of the basic geodetic network in the United States and Alaska for general mapping and large-scale engineering projects. Conditions in the far east brought new military demands for the bureau's products.

Sixteen ships and two shore-based parties were engaged in hydrographic surveys along the Atlantic, Gulf and Pacific coasts and in Alaska during the year.

High priority was given to work in Alaska, where surveys were extended in southeast Alaska, along the south coast of the Alaska peninsula, in the eastern Aleutians, in the Bering sea and along the arctic coast. The electronic position indicator, developed by the bureau for locating a survey vessel's position in hydrographic surveying, was used in Alaska for the first time to extend accurate surveys offshore beyond the line-of-sight range of shoran. The equipment was also used to tie in to the mainland, by a system of trilateration, islands in the Bering sea located several hundred miles from shore, thus co-ordinating their positions for the first time with the continent of North America.

Tidal observations were continued along the coasts of the United States and, under co-operative arrangements, along the Central and South American coasts. These observations furnished information for the prediction of tides and currents, for the establishment of mean sea level and for other engineering and scientific uses. A comprehensive current survey of the Aleutian Island passes was in progress during the year and valuable information of importance to navigation was obtained in this exposed area.

The basic network of geodetic control was further expanded. Priority was given to work in western Alaska and in various areas of the United States where surveys are required by the department of defense and other federal, state and local agencies. The adjustment of special geodetic earthquake surveys in southern California was completed. These surveys were part of a long-range program which would aid in determining the movement of the earth's crust in earthquake areas of the United States, with a view to forecasting an earthquake in advance of a major break.

The magnetic survey of the United States was continued and observations were made at 67 new stations and at seven observatories to provide information on magnetic declination, intensity and dip for use in navigation and in land surveying. The year witnessed the first important work of magnetic field surveying using an air-borne magnetometer, developed for surveying ocean areas and other regions inaccessible by ordinary magnetic methods. Thousands of miles of continuous magnetic profiles were obtained on flight lines in the United States and adjacent ocean areas to improve the magnetic data shown on aeronautical charts.

As part of its engineering seismology program, the bureau operated 53 strong-motion seismographs in the western areas of the United States for recording ground motions of destructive earthquakes, and maintained seismographs at 7 bureau field stations and co-operatively at 14 other stations for mapping earthquake areas. The system for warning the Hawaiian Islands against destructive seismic sea waves was extended during the year to include 16 reporting tide stations, 9 seismograph stations and a widespread communications network.

The aerial photographic coverage of coastal areas of the United States and Alaska was extended using the nine-lens camera. Aerial photographs of 149 airports were also taken for use in preparing airport obstruction plans.

More than 28,500,000 copies of the bureau's nautical and aeronautical charts were published during the year. At the end of the year 915 nautical charts and 1,028 aeronautical charts were available in different series to meet the various needs of marine and air navigation. (*See* also CARTOGRAPHY; GEOGRAPHY; OCEANOGRAPHY; SEISMOLOGY.)

(R. F. A. S.)

Coast Guard, U.S.

The primary functions of the U.S. coast guard are to (1) protect life and property at sea, including search and rescue; (2) enforce maritime laws and regulations; (3) maintain aids to navigation; (4) regulate merchant marine safety; and (5) maintain a state of military readiness. The coast guard lent its support during 1951 to a proposal to establish new minimum safety standards for the boating industry and to legislation to require far-reaching safety standards for vessels that carry passengers for hire.

For its program of military preparedness and defense mobilization, the coast guard received a supplemental appropriation of $30,875,000 to increase personnel by 5,900 and expand its activities in support of the other armed services. An additional responsibility of the coast guard in 1951 was the conduct of the new port security program authorized by the Magnuson act. The purpose of this program was to prevent subversives and other poor security risks from serving aboard U.S. merchant marine vessels or having access to sensitive waterfront facilities or vessels in port. It called for the security clearance of all seamen, longshoremen, dock workers and others who had access to waterfronts or vessels.

More than 5,000 persons were rescued by the coast guard in 1951. In March, when the 8,170-ton U.S. freighter "Andrea F. Luckenbach" struck a reef 3 mi. off the Hawaiian island of Kauai, the coast guard cutter "Iroquois" rescued 38 passengers and crew as coast guard planes hovered overhead, setting off flares to light the rescue scene.

In April two tankers collided in the Gulf of Mexico and burst into flames. Only 5 of 42 crew members on one of the tankers were found alive when coast guard rescue cutters arrived. Three crew members of the other tanker died.

The cutter "Cherokee" stood by to extinguish the fires and rescue survivors on May 14, 1951, after a collision between a collier and the navy seaplane tender "Valcour," loaded with high-octane gasoline, off Cape Henry, Va. Thirty-six lives were lost.

In July a four-engined Korean air-lift transport plane disappeared with 38 aboard along the rugged Alaska panhandle coast while en route to Anchorage on the first leg of its trip to Tokyo. The cutters "Citrus" and "Cahoone" scoured the icy mouth of the Gulf of Alaska northward from Cape Spencer, directing the hunt for the missing plane. Off its course, the plane would have encountered the 14,000-ft. peaks of the Barbazon mountain range, where several other planes were lost earlier in the year.

On Aug. 27, 1951, a ship's doctor, aboard a homeward-bound troopship 870 mi. out of San Francisco, Calif., radioed that a young corporal, stricken with either polio or meningitis, could not live without a respirator. Within a few hours a coast guard plane parachuted the needed equipment to the troopship.

On Sept. 1, 1951, the 45-ft. pleasure fishing boat "Pelican" capsized off Montauk point. Coast guard vessels picked up 13 survivors, but 35 persons were lost.

When floodwaters in April and July hit eastern Kansas and western Missouri, coast guard personnel and equipment, including helicopters and other aircraft, were used to evacuate persons, livestock and perishables. They also transported workers and guarded against looting.

Ice breaking on the Great Lakes started on March 12, 1951. The coast guard icebreaker "Mackinaw" and other cutters got the first commercial vessels through by March 30. More than 700 vessels were assisted through the ice.

The 1951 International Ice Patrol off the Grand Banks, Nfd., designed to warn transatlantic liners of the presence of icebergs, was inaugurated on Feb. 17, 1951, by aerial reconnaissance. By May 24, 1951, no menace from icebergs to recognized steamer lanes was found and the patrol was discontinued.

The icebreaker "Northwind" cruised 14,716 mi. during the summer in the Bering sea and Arctic ocean, protecting life and property, the seal herds and other wildlife; transporting a floating court; and furnishing medical and dental assistance to natives and others in remote localities.

Coast guard vessels manned eight ocean weather stations in the Atlantic and Pacific, providing search and rescue, communications, air navigation facilities and meteorological services in ocean areas regularly traversed by aircraft of the U.S.

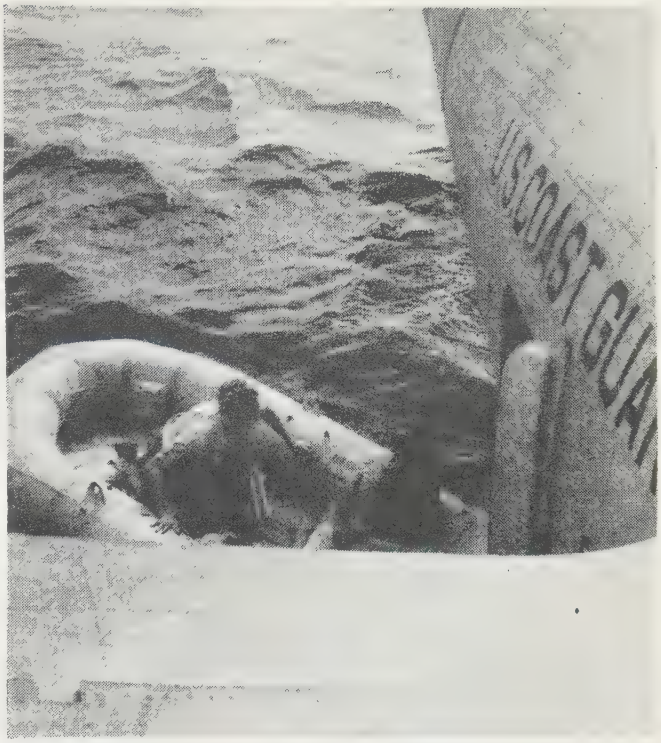
During the year, a total of 37,791 aids to navigation were maintained by the coast guard. Eight coast guard loran stations in the U.S. and 25 others from Greenland to the Philippines provided surface vessel and aircraft navigators with means for accurate and quick determination of their positions at all times regardless of weather conditions.

Port security forces boarded 22,827 vessels, and issued 990 explosive loading and discharge permits involving 2,353,839 tons of explosives. They also enforced the federal laws including the Oil Pollution act, anchorage regulations and laws relating to internal revenue, customs, immigration, quarantine and conservation of wildlife and fisheries.

The membership of the coast guard auxiliary increased to 13,076 with affiliated ownership of 6,838 boats, 404 planes and 206 radio stations. Members gave courtesy motorboat and small boat seamanship training to the general public, provided safety patrols for regattas and carried out a program of safety education and self-help.

Merchant marine safety inspectors conducted 6,535 annual inspections, 5,763 drydock examinations and 2,682 reinspections, as well as making numerous special surveys. There were 461,535 undocumented motorboats in the United States at the end of the fiscal year, an increase of 9,208. Of 2,427 marine casualties reported, 1,000 were investigated in detail. Merchant marine personnel officers issued 91,591 documents (licences and certificates), 24,453 of which were to new officers and men in the merchant marine. Shipping commissioners supervised the execution of 14,532 sets of shipping articles. Hearing units in the U.S. and merchant marine details at London, Antwerp, Bremerhaven, Naples, Trieste and Piraeus investigated 7,026 cases involving negligence, incompetence and misconduct of merchant marine personnel, and hearings were held by civilian examiners in 808 cases.

Coast guard personnel, floating and shore unit strength on June 30, 1951, was as follows: Military personnel: 2,632 commissioned officers, 448 commissioned warrant officers, 467 warrant officers, 362 cadets, 25,375 enlisted men. Civilian personnel: 874 at headquarters, 1,542 field (salaried), 3,088 field (wage board), 627 field (lamplighters), total 6,131. Floating units: 181 cutters, 58 patrol boats, 37 lightships, 42 harbour tugs, 10 buoy boats, total 328 large craft; 171 motor lifeboats, 1,370 motorboats, 2,024 nonpowered craft, total 3,565 small boats. Shore establishments: 13 captain of the port offices, 15 port security units, 9 air stations, 12 bases, 170 lifeboat stations, 416 manned light stations, 83 attendant light stations, 38 loran transmitting stations, 1 receiving centre, 41 depots, 1 shipyard, 2 supply centres, 10 supply depots, 1 academy, 49 marine inspection offices, 12 primary radio stations, 2 training stations, total 875.



COAST GUARD RESCUE plane taking on a critically ill seaman (left), who was transferred by life raft from the Swedish motorship "Jon Gorthon," July 20, 1951; the vessel was 205 mi. offshore

In addition, the coast guard had 113 fixed and rotary-wing aircraft deploying from nine air stations and ten air detachments, to make 11,565 sorties and fly 31,386 hours. (M. O'N.)

Cobalt: *see* Mineral and Metal Production and Prices.
Cochin-China: *see* French Union; Indochina.

Cockcroft, Sir John Douglas (1897–), British physicist, was born at Todmorden, Yorks., Eng., May 27. He was educated at Todmorden Secondary school, at Manchester university and at St. John's college, Cambridge, of which he was a fellow, 1928–46, and an honorary fellow from 1947. He was Jacksonian professor of natural philosophy in the University of Cambridge, 1939–46. From 1941 to 1944, however, he served as chief superintendent, air defense research and development establishment, ministry of supply, and from 1944 to 1946 was director of the atomic energy division, National Research council of Canada. In 1946 he became director of the atomic energy research establishment, ministry of supply, at Harwell, Eng. It was at a meeting of the Royal society on April 28, 1932, that Lord Rutherford made the dramatic announcement that two of his workers at the Cavendish laboratory, Cambridge—Cockcroft and E. T. S. Walton (*q.v.*)—

"had successfully disintegrated the nuclei of lithium and other light elements by protons entirely artificially generated by high electric potentials." On Nov. 15, 1951, the Royal Swedish Academy of Sciences announced the award of the Nobel prize for physics jointly to Cockcroft and Walton for "their pioneer work on the transmutation of atomic nuclei by artificially accelerated atomic particles." Cockcroft had been elected a fellow of the Royal society in 1936 and had been knighted in 1948.

Cocoa (CACAO). World cacao bean production for 1951–52 was forecast at 1,672,000,000 lb., about 3% less than the record output of 1950–51 (1,724,000,000 lb.), but well above the pre-World War II average (1,578,541,000 lb.).

World Cacao Production by Leading Areas

(In thousands of pounds)

Area*	1951–52	1950–51	Average 1935–36 to 1939–40
Gold Coast	585,000	590,000	609,363
Brazil	310,000	300,000	263,980
Nigeria	235,000	247,000	216,318
French West Africa	110,000	133,000	109,937
French Cameroons and Equatorial Africa	108,000	111,000	60,221
Dominican Republic	60,000	66,140	54,049

*Some countries named include production of smaller nearby producers.

Prices reached a peak of about 38 cents per pound in June and thereafter fluctuated at considerably lower levels. It appeared that U.S. civilian consumption was on a level of 4.4 lb. per person, slightly more than in the previous year.

United States imports (about two-fifths of the world supply) in 1950–51 reached the highest level in six years, 674,000,000 lb., as compared with 654,000,000 lb. in the previous year. The value was $215,700,000, a 62% increase over the year before.

(J. K. R.)

Coffee. Civilian consumption of coffee in the U.S. during 1951, all from imported supplies, was indicated at 16.6 lb. per capita, as compared with 16.1 lb. in 1950 and 14.0 lb. before World War II.

The world exportable coffee crop of 1951–52 was estimated at 31,700,000 bags (of 132 lb.), an increase of 6% above the 1950–51 exportable output of 29,900,000 bags, but far below the pre-World War II average of 35,000,000 bags. It was estimated that producing countries would consume 8,300,000 bags, thus accounting for an estimated total world crop of about 40,000,000 bags. There were more uncertainties than usual regarding the size of the Brazilian exportable crop and possible action by Brazilian groups, price-wise.

A maximum ceiling price was placed on coffee at retail early in the year; the price continued generally somewhat above 50 cents per pound wholesale at New York city, a level at which supply and demand were in close balance and high enough, probably, to encourage new planting, especially in Africa, and some improvement in care of the trees and harvesting of the crop.

Exportable Coffee Production of the Principal Producing Countries

(In thousands of bags—132 lb. each)

Country	1951–52	1950–51	Average 1935–36 to 1939–40
Brazil	15,800	15,550	21,740
Colombia	5,700	4,500	4,202
Mexico	1,010	900	609
Guatemala	900	800	922
El Salvador	890	1,112	1,011
French West Africa	790	700	207
Angola	665	775	273
Uganda	660	650	222

(J. K. R.)

Coinage. The three U.S. coinage mints located at Philadelphia, Pa., San Francisco, Calif., and Denver, Colo., manufactured a total of 1,179,870,778 domestic and foreign coins during the government fiscal year 1951.

United States coin production was valued at $53,494,591 and consisted of the denominations given in the table.

Denomination	Number of pieces produced
Half dollars	17,229,837
Quarter dollars	72,013,352
Dimes	161,741,557
Five-cent pieces	40,845,462
One-cent pieces	865,990,570
Total domestic	1,157,820,778

The composition of the half dollars, quarter dollars and dimes was 90% silver and 10% copper; five-cent coins, 25% nickel and 75% copper; and one-cent coins, 95% copper and 5% zinc and tin, in conformity with U.S. coinage laws.

Foreign coinage during the fiscal year 1951 totalled 22,050,000 pieces of various denominations and alloys for governments of the Dominican Republic, El Salvador, Honduras and Syria.

In addition to the coinage mints, four other mint service institutions comprising the bureau of the mint were in operation in 1951—the assay offices at New York city and Seattle, Wash., the gold bullion depository at Fort Knox, Ky., and the silver bullion depository at West Point, N.Y. The entire mint service is administered by the director of the mint, with offices in Washington, D.C.

The principal functions of the bureau of the mint, other than the manufacture of domestic and foreign coins, include the safeguarding of the government's holdings of monetary metals; acquisition of gold and silver bullion; the refining of gold and silver; administration of the issuance of treasury licences for the acquisition, ownership, possession, use and exportation of gold for industrial, professional and artistic purposes; the manufacture of medals for the department of defense and medals of historic interest.

At the close of the government fiscal year 1951 the mint institutions held in their custody 67,300 tons of gold and silver bullion valued at $23,400,000,000.

(N. T. R.)

Coke. World production of coke advanced each year after the postwar low of 1945. The outputs of the major producing countries, as reported by the U.S. bureau of mines and listed in Table I, account for about 95% of the world total.

Table I.—*World Production of Coke**

(Thousands of short tons)

Increased demand in the rearmament program kept the output high in 1951, with a total of 59,170,632 tons in the first three quarters, against 53,009,800 tons in the same period of 1950.

(G. A. Ro.)

Cold, Common: *see* Ear, Nose and Throat, Diseases of.

Coldwell, Major James (1888–), Canadian member of parliament, was born at Seaton, Eng., on Dec. 2. He was educated at University college, Exeter, and emigrated to Canada in 1910. He first settled in Edmonton, Alta., but soon moved to Regina, Sask.

He spent 20 years as an educationist in Regina, and during the latter years was a school principal. In 1922 he entered the political arena, and won a seat on the Regina city council, which he held until 1932. He joined the Saskatchewan Farmers Political association, and was provincial leader of the Saskatchewan Farmer-Labour party, 1932–35. In 1935 he won the federal riding Rosetown-Biggar (Sask.) for the Co-operative Commonwealth federation, and held it at the 1940, 1945 and 1949 elections. In 1942 Coldwell became president of the C.C.F.

Despite heavy parliamentary responsibilities, he was active in international affairs in the 1940–50 decade, as delegate to such gatherings as the Empire parliamentary conference, the Institute of Pacific Relations, the San Francisco United Nations conference and the United Nations assembly at Lake Success.

In the 1951 sessions of parliament, Coldwell led his group in several spirited attacks upon the Liberal government of Louis St. Laurent, but in the main supported Liberal legislative proposals. (C. Cy.)

Colleges and Universities: *see* Universities and Colleges.

Collins, J(oseph) Lawton (1896–), U.S. army chief of staff, was born on May 1 in New Orleans, La., and entered the U.S. Military academy at West Point, N.Y., in 1913. After World War I he served with the occupation forces in Germany until 1921, when he began a four-year period as an instructor at West Point. Early in World War II he was given duty in the Pacific, and he won the nickname of "Lightning Joe" in the recapture of Guadalcanal. Assigned to Europe in 1943, he led the U.S. 7th corps in the invasion of France, the capture of Cherbourg, the breakthrough at St. Lô and the liberation of Belgium, and finally to the Elbe. He was named deputy chief of staff in 1947, vice-chief of staff in 1948 and chief of staff, U.S. army, Aug. 1949.

In Feb. 1951 General Collins revealed that the U.S. would shortly have both atomic artillery shells and guided missiles. He was one of the high U.S. military officials who opposed any restriction on the right of the president to dispatch troops to Europe. Following the dismissal of Gen. Douglas MacArthur, General Collins testified before a joint U.S. senate armed services and foreign policy committee that MacArthur's dispatching of U.S. troops to the Manchurian frontier had been a violation of a "clearcut directive" to let only South Korean troops go all the way. He said the chiefs of staff had agreed that MacArthur should be removed to prevent "more serious" violations of policy.

Colombia. A republic situated in northwestern South America adjoining the isthmus of Panamá, Colombia is the only South American country with both Caribbean and Pacific coast lines. Area: 439,714 sq.mi.; pop. (1950 U.N. est.): 11,260.000. Approximately 68% of the population is classified as mixed blood, 20% as "white," 7% as Indian and 5% as Negro. Most Colombians live in the highlands and mountain valleys of the interior. The capital is Bogotá (1947 pop.: 482,480). Other major cities are Barranquilla (225,430), Bucaramanga (71,240), Cali (147,160), Cartagena (106,820), Cúcuta (77,480), Ibagué (84,840), Manizales (117,760), Medellín (237,220), Neiva (39,490), Pasto (63,430), Popayán (35,960), Santa Marta (43,950) and Tunja (27,080). Language: Spanish; religion: predominantly Roman Catholic. President in 1951: Laureano Gómez.

History.—During 1951, bitter strife between the incumbent Conservative and opposition Liberal parties brought Colombia close to civil war. The state of siege originally proclaimed in Nov. 1949 remained in force, and guerrilla clashes between Conservatives and Liberals, occurring primarily in rural areas, persisted. Under the state of siege, constitutional guarantees remained suspended. Censorship of radio news broadcasts was installed in April as an addition to the previously existing press censorship. Congressional elections, originally scheduled for June, were postponed until September. In explaining that action, President Gómez declared that there would be little point in holding an election so long as the Liberal opposition clung to its policy of electoral abstention, and that he hoped the Liberals would abandon that position by September. This did not prove to be the case; when the congressional elections were held on Sept. 16 there were no Liberal candidates, with the result that the party composition of the national legislature became 100% Conservative.

An attempt to achieve reconciliation between the two major parties was launched by the Liberals in early summer, when that party elected former Pres. (1934–38, 1942–45) Alfonso López Pumarejo to a two-year term on the Liberal party council. Further steps toward interparty harmony were taken in August, when moderate members of both parties met to discuss a project to call a constituent assembly for the purpose of restoring constitutional government. That project failed. In October, however, the Conservative and Liberal parties agreed to attempt to eliminate violence by political "bandit" gangs, and at the end of the year some Colombians saw hope of eventual domestic peace.

The Colombian government announced in February that it would send a "hand-picked battalion" of 1,080 officers and men to assist the United Nations forces in Korea. Considerable publicity attended the battalion's preparation for departure, but by the end of the year it had not yet appeared in combat zones. However, a Colombian frigate—the first South American fighting unit to participate in the Korean action—joined United Nations task force 95 in Korean waters in May. (*See* also International Bank for Reconstruction and Development.)

(G. I. B.)

Education.—In 1947, 11,320 primary schools reported enrolments totalling 738,716 pupils with 17,528 teachers; 1,005 secondary and vocational schools had 92,112 students and 7,480 teachers; 57 university faculties reported 8,032 students and 1,335 faculty members. In addition, 1,206 primary, 630 secondary and 2 higher educational institutions did not report enrolments. About 8% of the 1951 budget was allocated to education.

Finance.—The monetary unit is the peso, valued at 39.84 cents U.S. currency, basic rate, on Nov. 30, 1951. Actual revenue in 1950 totalled 570,176,000 pesos; expenditure, 525,371,000 pesos. The 1951 budget balanced expenditure and revenue at 461,000,000 pesos plus 50,000,000 pesos for the treasury balance and credit operations for public works. The 1952 budget as presented to congress totalled 632,700,000 pesos. The public debt amounted to 511,413,172 pesos on Dec. 31, 1950. Currency in circulation on Sept. 30, 1951, totalled 406,300,000 pesos; demand deposits 595,900,000 pesos; time deposits (Aug. 31, 1951) 49,400,000 pesos; government deposits 91,600,000 pesos; gold reserves (May 1951) U.S. $66,000,000; foreign exchange reserves (May 1951) U.S. $53.000,000. The national income was reported to be 3,690,000,000 pesos in 1948.

Trade and Communications.—Exports in 1950 totalled 767,556,000 pesos; imports, 655,853,000 pesos. Leading exports were coffee (78%), petroleum (16%), gold (2%) and bananas (2%). Leading customers were the U.S. (83%), the Netherlands Antilles (4%), Germany (4%), Canada (2%) and Sweden (1%). Important suppliers were the U.S. (68%), the United Kingdom (5%), Germany (5%), Canada (3%) and Sweden (2%).

In 1947 there were 2,208 mi. of railroad and (1948) 11,166 mi. of improved highways. Motor vehicles (Dec. 31, 1948) included 25,657 automobiles and 22,830 trucks and buses. Civil air lines carried 901,850 passengers and 210,000 short tons of cargo in 1950, and 400 barges carried 2,915,000 short tons of cargo on the Magdalena river.

Agriculture.—Coffee production in 1950 was about 5,000,000 bags of 132 lb. each, of which 4,480,567 bags were exported, 4,059,763 bags to the U.S. Banana exports were 6,437,834 stems. Production of other crops included cotton (ginned) 7,750 short tons; rice (milled) 159,000 tons; and potatoes 485,000 tons. Sugar production included centrifugal 161,000 tons and *panela* 520,000 tons. In 1950 there were an estimated 15,200,000 cattle, 2,470,000 pigs, 531,000 goats and (1949) 1,061,000 sheep.

Manufactures.—The leading industries were foodstuffs, textiles and beverages. Production figures in 1950 included cement 639,259 short tons; beer, about 600,000,000 l.; and rubber-soled shoes, about 3,000,000 pairs. The largest cotton textile factory, located at Medellín, produced about 100,000,000 yd.

Mineral Production.—Production figures in 1950 included gold 379,412 troy oz.; platinum 24,452 oz.; silver 116,104 oz.; and salt 155,445 short tons. Crude petroleum production totalled 34,059,017 bbl. Crude exports were 28,268,872 bbl., of which 15,672,670 bbl. went to the U.S. and 9,297,535 bbl. to Curaçao (for refining). The refinery production throughout was 9,563,587 bbl., and refined products included 2,019,000 bbl. of gasoline. (J. W. Mw.)

Colorado. A Rocky mountain state of the United States, in the west central part, Colorado has a mean elevation above sea level of 6,800 ft., the highest of any state. Admitted to the union in 1876 as the 38th state, it is known as the "Centennial state." Its area of 104,247 sq.mi. includes 325 sq.mi. of water surface. The U.S. owns 34.5% of the total land area and 59.3% is in private ownership, the remainder belonging to state, county and municipal governments.

The 1950 census showed a population of 1,325,089, a gain of approximately 18% from 1940; 62.7% was urban, 37.3% rural. Capital: Denver, pop. (1950 census) 415,786. Other cities (1950 census): Pueblo, 63,685; Colorado Springs, 45,472; Greeley, 20,354.

History.—The first regular session of the 38th assembly convened Jan. 2, 1951, and adjourned on March 21, 1951. Important legislation enacted provided for the following programs: a civil defense organization; a parole organization; the establishment of a state board of state institutions and a director of institutions to administer and manage all penal and charitable institutions in the state; greater benefits under the workmen's compensation act; organization of a fair employment practices educational program; a bill supplanting the existing law concerning the board of medical examiners; a bill creating a new board in regulation of practice of engineering; an administrative code providing that the state purchasing agent shall operate a state car pool system for the use of state-owned vehicles; a bill to amend the law regarding adoption of minor children.

The first extraordinary session of the 38th general assembly convened May 17, 1951, pursuant to call of Gov. Daniel Thornton for the purpose of revising the general county school funds.

The state officers in 1951 were: Daniel I. J. Thornton (Rep.), governor; Gordon Allott (Rep.), lieutenant governor; George J. Baker (Dem.), re-elected secretary of state; Homer F. Bedford (Dem.), auditor; Earl E. Ewing (Rep.), treasurer; Duke W. Dunbar (Rep.), attorney general.

Education.—The state appropriation for education in the public schools, 1951–52, was $10,000,000. The average current expense per pupil in average daily attendance for the school year 1949–50 was $212.20; the total average daily attendance was 201,384 during 1950–51. The school population, including persons 6 to 21 years of age, increased from 314,399 in 1950 to 319,121 in 1951. A total of 10,477 teachers and administrators were employed in the Colorado public schools during 1950–51.

During the fiscal year 1950–51, the 132 county and municipal libraries in Colorado loaned more than 4,000,000 books, films, recordings and other library materials to their patrons at a cost of slightly more than $1,000,000.

Social Insurance and Assistance, Public Welfare and Related Programs.—Disbursements from the state public welfare fund for assistance and administration in 1950 amounted to $55,848,236.37. Of this amount, $42,905,439.75 was expended for pensions, including burials; $5,546,140.12 for aid to dependent children; $290,361.48 for aid to the blind, for awards, treatment and burials; $4,198,488.26 for general assistance; $468,920.50 for tuberculosis hospitalization, including outpatient care and burials; $227,097.27 for child welfare; and $2,211,788.99 for state office administration expenses and allotments to counties for the state's share of salaries and travel. In addition to the above, there was a transfer to the general fund of $2,108,965.21. Federal participation during 1950 in old-age pensions, aid to dependent children, aid to the blind and administration amounted to $20,023,875.58.

The average monthly number of recipients by program were as follows: for old-age pensions, 50,617 received an average of $70.59; 15,131 child recipients of aid to dependent children received an average of $30.62 per child; and 381 aid to the blind cases received an average of $56.29.

Table I.—*Principal Crops of Colorado*

Crop	1951	1950	Average, 1940–49
Corn, bu.	15,782,000	13,368,000	15,145,000
Wheat, all, bu.	34,967,000	36,909,000	35,996,000

Communications.—Highways (state and federal) in 1950 totalled 78,864 mi. Improved roads totalled 26,102 mi., unimproved roads 52,762 mi. Total funds disbursed for highways in 1950 amounted to $22,959,714.74. Registered motor vehicles in 1950 numbered 572,681. As of Aug. 1, 1951, there were 36 bus companies serving the state and 16 steam (1 electric) railroads had a total railroad mileage within the state of 4,311. There were five scheduled air lines serving the state. There were 160 airports and landing fields operating, of which 55 were personal-use type fields.

Telephones in use on Dec. 31, 1950, numbered 431,361. There were 33 standard AM radio stations and 3 FM stations, plus 1 noncommercial educational FM station.

Banking and Finance.—As of Jan. 1951 there were 77 national banks and 71 state banks. Deposits in all banks at the close of 1950 were $1,216,378,000. Clearings in Denver (1950) $6,717,178,000; in Pueblo $536,153,000; in Colorado Springs $556,398,000.

The cash balance in the treasury as of June 30, 1951, was $55,228,238.52. Total revenue in the fiscal year ended June 30, 1951, $178,667,649.70. All expenditures, including functional services, debt services and transfers, amounted to $169,737,396.39. There was no bonded indebtedness. Highway anticipation warrants totalled $5,505,000. Outstanding warrants, cash and general revenue amounted to $6,881,078.02. Investments, June 30, 1951, of $37,296,438.35, plus a cash balance of $55,228,238.52, made a total of $92,524,676.87 in liquid assets. The state surplus at close of fiscal year ending June 30, 1951, was $17,323,900.35.

Agriculture—In 1950 the cash income from farm marketings totalled $506,000,000. This was made up of $316,000,000 from sale of livestock and livestock products and $190,000,000 from sale of crops. Government payments were not included nor was the value of farm products produced and used on the farm. Production of the leading crops is given in Table I.

The numbers of meat-producing animals on Colorado farms and ranches Jan. 1, 1951, were as follows: cattle 1,818,000; stock sheep 1,210,000; hogs and pigs 316,000. In addition, there were 435,000 lambs in feed lots.

Manufacturing and Industry.—The department of commerce estimate for the value added to Colorado manufactures in 1950 was $315,450,000. There were 1,705 industries in the state, employing 60,000 persons, with an annual pay roll of $158,627,000. The principal industries were food and kindred products, printing and publishing, lumber and products, stone clay, glass products, machinery, petroleum products and primary metals.

Tourist travel in Colorado is the third largest industry in the state. In 1950 the income derived from 3,010,000 travellers was $203,000,000. (P. Ae.)

Table II.—*Mineral Production of Colorado*

(In short tons, except as noted)

*1950 est. if not otherwise stated. †1951 census. ‡1951 est.

Communism. Communism in 1951 pursued the same general line of policy as in the preceding years. Its propaganda, which in the first years after World War II was mainly directed against Great Britain and against capitalism in general, centred more and more on a virulent campaign against the United States system and supposed U.S. intentions. This hate-U.S.-first attitude led in typical Communist fashion to a reinterpretation of history so that the United States appeared, both in the present and the past, as the implacable enemy of the soviet people and of its striving for social justice and for a world free of war and exploitation. The main points in the Communist propaganda platform were no longer, however, social revolution or international class war. These had been replaced almost entirely, at least for the time being, by an emphasis on peace. Joseph Stalin and the Soviet Union were presented as the main guardians of peace in the interest of all the peoples of the world, while the United States was pictured as the chief imperialist destroyer of peace, which wished to drive mankind into the ruins of an atomic war for the profit of U.S. finance and business.

This peace propaganda—which recalled a similar peace propaganda by the soviet government in the months following its seizure of power in Nov. 1917—was in no way confined to Communists or Communist-controlled countries. It was world-wide and penetrated all classes among many peoples in Europe and Asia, exploiting their natural and legitimate desire for peace and for economic reconstruction. It was carried on by many non-Communists. Though it did not succeed in winning converts to the Communist doctrine or organization, the Communist parties being unable to make any inroads anywhere in Europe or Asia in 1951, it alienated many people from support of the foreign policy of the United States, which was being misrepresented as a policy of superarmament, atomic and otherwise, a policy which imposed unbearable economic burdens on peoples hardly recovered from the devastations of World War II. Communist propaganda asserted that the U.S. was arming itself, and was forcing its allies to follow suit, in order to prepare for a showdown with the Soviet Union.

In such a showdown, backed by the threat of war, it would attempt to force the Soviet Union to surrender and to accept United States world domination.

This "peace" campaign, carried on with all the fervour of a crusade against the sin of war, was started in 1949 by the Scientific and Cultural Conference for World Peace in New York city and the World Congress of Partisans of Peace in Paris and Prague, Czech., and was continued in 1950 by similar congresses in Stockholm, Swed., and Warsaw, Pol. Throughout 1951 petitions for "peace" were circulated in many countries. Some of the slogans most widely used were demands for the abolition of the atomic bomb and for the exclusive use of atomic power for peaceful and constructive purposes, a call for a pact of friendship and nonaggression among the five big powers, and opposition to the rearmament of Germany and Japan. As the result of this campaign, the attitude of "neutralism" in the struggle between the Soviet Union and the United States, as equally bellicose and dangerous powers, made much headway in France, Italy, western Germany and throughout Asia. Nor had the United States succeeded in dispelling the erroneous impression created by Communist propaganda that the United States was arming for an ultimate showdown or for a preventive war which would be unleashed as soon as U.S. armament had reached its maximum strength.

The handling of the Korean truce talks by an exclusively U.S. team and various incidents connected with these negotiations were repeatedly used by Communist propagandists to distort U.S. motives.

In spite of the psychological gains of the Communist "peace" propaganda, the hope for immediate practical results did not materialize. The Communist-led "peace partisans" and trade unionists in France and Italy were unable to carry through their threat of stopping the delivery of U.S. war material to the French and Italian armies. Plans for a strike protesting the arrival of Gen. Dwight D. Eisenhower in Paris in Jan. 1951 to assume command of the forces of the North Atlantic Treaty organization, and similar plans for his arrival in Rome in Nov. 1951 to report to the meeting of the council of the organization, petered out. The secretary general of the Communist-dominated French trade union organization the Confédération Générale du Travail was reported to have declared to the congress of the Communist-led World Federation of Trade Unions in Berlin in November that the western military program must be sabotaged at all costs. But during 1951 the rearmament program was not impeded by any direct sabotage. The World Federation of Trade Unions lost much of its former influence and drive. It had its headquarters in Paris until the beginning of 1951, as had two other Communist-dominated organizations, the World Federa-

"SET IT DOWN ANYWHERE. WE'RE OVERCROWDED ALREADY!"

"THANK YOU!" "THANK YOU!" "THANK YOU!"

"WE NOW BRING YOU MORE LATE ELECTION RETURNS" tion of Democratic Youth and the International Democratic Federation of Women. On Jan. 26, 1951, the French government ordered the dissolution of the Parisian headquarters of these organizations.

The Berlin congress of the World Federation of Trade Unions appealed to all workers, including even the anti-Communist International Confederation of Free Trade Unions which had split in 1949 from the World Federation of Trade Unions, for common action on the basis of economic demands and a fight for peace against United States plutocracy and imperialism. This appeal remained unheeded. The Communists also tried to exploit the discontent of the native populations in colonial countries, especially in French-dominated Indochina and Morocco, and supported their demands for liberty and economic betterment. In the independent nations of Asia communism made headway only in Burma, which had been torn by internal strife since Jan. 1948 when it was granted independence from Great Britain. But democracy held its own successfully throughout 1951.

On the strength of its "dialectics," communism apparently was able to reconcile its shrill propaganda of hatred against the United States and the other democracies with the assurances of its own unique love and guardianship of peace. The supreme soviet of the U.S.S.R. in its session of March 1951 in Moscow adopted a law for the defense of peace in which all war propaganda was declared a crime against mankind and the most severe punishment was threatened against anybody guilty of this crime. The legislation was clearly aimed at persons in democratic countries. The official party line was expressed in an article in the Sept. 1951 issue of the leading soviet philosophical journal *Problems of Philosophy*. It maintained that the Marxist thesis of the inevitability of war between socialism and capitalism was no longer suitable. Thanks to the growing power of the "camp of the peace," the "camp of warmongers" would not prevail, the soviet periodical asserted; it regarded the opinion that war was inevitable as equally antiscientific and harmful as the opinion that war could not break out. All Communist propaganda emphasized, simultaneously with its assurances of its own peace-loving character and of the wickedness of U.S. warmongering, the growing strength of the Soviet Union and the other Communist states as the bulwark for peace and as the guarantee for the ultimate success of communism on a world-wide scale.

The ever-tightening "iron curtain" prevented any definite estimate of the economic strength and the moral cohesion in the Communist countries. But in the Communist-dominated "people's democracies" of eastern Europe, the purges of numerous high-ranking and devoted Communists who suddenly were denounced as criminals of the worst kind continued. The purges hit not only those Communists who were suspected of even the slightest contact with the west during World War II, but also Moscow-trained leaders.

The most far-reaching purges were carried on in 1951 in Czechoslovakia, where Vladimir Clementis, Communist minister of foreign affairs and successor to Jan Masaryk, was arrested in February and accused together with Otto Sling, secretary of the Communist organization in Brno, the second largest city of Czechoslovakia, and Marie Svermova, organizational secretary of the central committee of the Czech Communist party, as a nationalist and as a spy for western imperialism. In February Klement Gottwald, Communist president of Czechoslovakia, stated publicly that the Communist party had found within its ranks a five-year-old plot for lining the country up with western capitalism. In November Rudolf Slansky, former secretary general of the Czech Communist party and for many years the most influential and extreme Communist leader in the country, was arrested and denounced as a Titoist and an agent of U.S. imperialism. Outside observers interpreted the purges and this appeal to Czech nationalism as an acknowledgment of the failure of the Communist economic policy. All the "people's democracies" in central and eastern Europe had suffered under Communist leadership a rapid deterioration of their standard of living.

COMMUNISTS INDICTED for conspiracy in June 1951 shown entering a police van in New York City on their way to prison. Of the 11 leading Communists convicted, 4 jumped bail and became fugitives

The Communist parties outside the soviet-controlled countries showed no sign of large-scale defection. However, in Italy two leading Communists, Valdo Magnani and Aldo Cucchi, both members of parliament from the province of Reggio Emilia, where Magnani was secretary of the provincial party organization, resigned from the party. They pleaded for the complete independence of the Italian Communist party, and demanded that the Communist workers should defend Italy against any invasion, whether from the west or from the east. Except for this one case, Titoism, or the desire to free national Communist parties from subservience to the U.S.S.R., did not prove of major importance.

In the western hemisphere, communism made no headway in 1951 except in the Central American republic of Guatemala. The Communists who had become entrenched there during the regime of Pres. Juan José Arévalo seemed to be still gaining ground. High government officials attended the Communist labour conference held in Guatemala in May 1951 under the auspices of the Mexican pro-Communist leader Lombardo Toledano and the French Communist Louis Saillant, but they did not respond to invitations to attend the anti-Communist conference held at the end of November. In the United States the supreme court confirmed the conviction of 11 top Communists in the country for conspiracy to teach violent overthrow of the government.

In Australia the high court in March declared invalid a federal act outlawing the Communist party, which had been enacted in Oct. 1950. To give the government the power to re-enact the law, Prime Minister Robert Gordon Menzies in July introduced a bill to amend the commonwealth constitution. The bill was submitted to a popular referendum, in which it needed approval by a majority of the Australian states and of the electorate to become law. On Sept. 22 the voters rejected the constitutional amendment empowering the government to implement the Communist Party Dissolution act. Four of the six states voted against it, and the margin of the individual votes against it was 153,000. Community Chest.

The community chest is the name given to a local federation made up of health, welfare and recreation agencies supported by voluntary contributions. Its purpose is to raise annually, by a single united campaign, funds for the support of its member agencies and, through community welfare councils financed by chest funds, to promote joint planning for health and welfare in the community.

Community Chests and Councils of America, Inc., the national association of local community chests and welfare councils, was organized in Feb. 1918.

Of the 2,013 community chests and welfare councils in operation in July 1951 (1,582 chests and 431 councils), 1,516 chests and 404 councils were in the continental U.S.; 5 chests and 3 councils in Hawaii; 54 chests and 22 councils in Canada; 2 chests in South Africa; 1 chest in the Virgin Islands; 1 chest in Puerto Rico; 1 council in the British West Indies; 1 chest and 1 council in Japan; 1 chest in the Philippines; and 1 chest in Alaska. Almost every city in the U.S. (except New York city, which has a limited joint-financing organization and a welfare council) in 1951 had a community chest or similar plan of federated financing for its voluntary social services. In 1,498 cities in 1950 more than 20,000,000 contributions totalling $212,987,-292 were given to community chests to be used during 1951 for voluntary health and welfare services in their communities. The United Defense fund, including the United Service organizations (U.S.O.), United Community Defense services and Clothes for Koreans, was formed in 1951 to finance special services by about 30 national agencies to armed forces and to civilians in defense communities. It received its chief financial support from United Red Feather campaigns. National promotion of chest campaigns is carried on under the name United Red Feather Campaigns of America, using the national symbol of the red feather.

Officers of C.C.C., Inc., for 1951 were: honorary president, Gerard Swope, New York city; president, Stanley C. Allyn, Dayton, O.; treasurer, H. L. R. Emmet, Erie, Pa.; secretary, Mrs. Oswald B. Lord, New York city. Ralph H. Blanchard was executive director. Headquarters are at 155 E. 44th St., New York, N.Y. (B. A.)

Community Trusts.

An aggregate of $102,005,711 was reported as the assets of community trusts and foundations in the United States, Canada and Hawaii at Jan. 1, 1951. During 1950 these composite foundations appropriated $5,223,911 for charitable projects. In the same year they received new resources totalling $6,455,057.

The largest of these foundations was the New York Community trust whose 100 funds were valued at $19,128,066. The Chicago Community trust reported $15,003,603; the Cleveland foundation, $12,852,717; the Permanent Charity fund, Boston, Mass., $9,857,013; and the California Community foundation, Los Angeles, $7,633,084. Of the disbursements made in 1950, the New York Community trust paid out $1,632,278; Detroit, $741,013; Chicago, $497,307; Boston, $446,610; and Cleveland, $429,291.

Funds newly received in that year included $1,529,185 accruing to the Cleveland foundation, $716,951 reaching the Detroit Community trust and $714,947 added to the New York Community trust. Community foundations became operative in Beloit, Wis., Jackson, Mich., and Norfolk, Va., during 1950.

Of 79 community trusts surveyed in 1951, 70 were administering principal resources and 62 were making current distributions out of 858 funds on hand. Their cumulative disbursements from 1930 through 1950 stood at $39,692,546.

A community trust consists, usually, of a series of trust funds of varied sizes, held by a number of corporate trustees and applied for diverse charitable uses under the central supervision of a joint distributing committee. The trustee of a given fund is ordinarily chosen by its founder. The distributing committee, when authorizing disbursements by the trustee, customarily undertakes to give expression to the specific charitable desires of a founder—stated either when a trust is created or perhaps (in cases of living trusts) subsequently—but is likewise empowered to take appropriate remedial action if previously expressed preferences later become impossible or impractical of execution. Congregational Christian Churches.

The Congregational Christian Churches are a Christian communion organized on a democratic basis. The local churches are united in district associations, state conferences and the National General council for fellowship, mutual aid, missionary work and social service.

The Congregational principle of church organization has been implicit in Christianity from the beginning but came to the fore in the late 16th century in England. The first Congregationalists to arrive in America were the passengers on the "Mayflower" in 1620, but their settlement at Plymouth was soon overshadowed by the much larger immigrations into Massachusetts Bay. Thence in the following 150 years Congregationalists spread over New England and southward until at the time of the Revolution their churches numbered approximately 800 out of a total of 1,700 colonial churches. The "Christians" were a body of about 100,000 members which had its beginnings in the late 18th century in New England, Virginia and North Carolina, and the Ohio valley, and united with the Congregational fellowship in 1931.

As of Jan. 1, 1951, the total number of Congregational Christian Churches in the United States was 5,651 with 1,227,527 members, 5,728 ministers and 619,679 church school members. During 1950, 48,902 persons were received into the churches on confession of faith—the largest total on record. During that year the churches contributed $5,522,324 to benevolences and $31,530,701 to local church support.

During 1951 Sidney M. Berry of London, Eng., the minister and secretary of the International Congregational council, visited the United States. Plans were ratified for the holding of the next meeting of the council in Scotland in 1953.

During 1951 the American Board of Commissioners for Foreign Missions, the Congregational Christian foreign missionary board, withdrew its missionaries from Communist China, only three remaining there at the end of the year because of lack of transportation from Chinese ports.

For some years the Congregational Christian Churches had been planning a merger with the Evangelical and Reformed Church. During 1949, however, an antimerger faction in the Congregational Christian Churches secured a court injunction against further moves toward the union, and at the close of 1951 the matter had just come to the appellate division of the supreme court of New York state for review. (*See* also CHRISTIAN UNITY; CHURCH MEMBERSHIP.) (D. HT.)

Congress, United States.

The 82nd U.S. congress convened for its second session on Jan. 8, 1952. It comprised the following members (as of Jan. 8, 1952):

United States Senate

Presiding Officer: Alben W. Barkley of Kentucky
Majority Leader: Ernest W. McFarland of Arizona
Minority Leader: Styles Bridges of New Hampshire
Democrats: 49; Republicans: 46; Democratic-Liberal: 1.

[1] Caused by the death of John A. Whitaker, Dec. 15, 1951.

[2] Elected April 14, 1951, to fill the vacancy caused by the resignation of Thomas R. Underwood, March 17, 1951.

[3] Elected Oct. 22, 1951, to fill the vacancy caused by the death of Frank Fellows, Aug. 27, 1951.

[4] Elected March 9, 1951, to fill the vacancy caused by the death of John B. Sullivan, Jan. 29, 1951.

[5] Elected Dec. 4, 1951, to fill the vacancy caused by the death of Karl Stefan, Oct. 2, 1951.

[6] Elected Nov. 6, 1951, to fill the vacancy caused by the resignation of Harry L. Towe, Sept. 7, 1951.

[7] Caused by the resignation of T. Vincent Quinn, Dec. 30, 1951.

[8] Elected Nov. 6, 1951, to fill the vacancy caused by the resignation of Edward Breen, Oct. 1, 1951.

[9] Elected Nov. 6, 1951, to fill the vacancy caused by the death of Albert C. Vaughn, Sept. 1, 1951.

[10] Elected Nov. 6, 1951, to fill the vacancy caused by the death of Wilson D. Gillette, Aug. 7, 1951.

[11] Elected July 24, 1951, to fill the vacancy caused by the death of Frank Buchanan, April 27, 1951.

[12] Elected Sept. 8, 1951, to fill the vacancy caused by the resignation of Ed Gossett, July 31, 1951.

[13] Elected July 17, 1951, to fill the vacancy caused by the death of John Kee, May 8, 1951.

Congress of Industrial Organizations: *see* LABOUR UNIONS.

Connally, Tom (Thomas Terry)

(1877—), U.S. senator, was born on Aug. 19 in McLennan county, Tex. He studied at Baylor University, Waco, Tex., and the University of Texas at Austin, served two terms in the Texas legislature and six terms in the U.S. house of representatives, and in 1928 was elected to the U.S. senate. He was chairman of the senate foreign relations committee during World War II and most of the succeeding years, and worked with Sen. Arthur Vandenberg, Republican, to effect a bipartisan foreign policy. In 1951 he appeared on more than one occasion as a critic, at least by implication, of details of U.S. foreign and military policy. In January, at closed conferences with state department leaders, he rebuked them for even considering a cease-fire proposition with the Chinese Reds without first conferring with congress. However, he was outspokenly antagonistic to the ideas of Republican Sen. Robert A. Taft during the debate on U.S. foreign policy. He charged Taft with designing a "strength through weakness" approach that would prejudice U.S. aid to allies in Europe. On the question of limiting the president's right to send troops abroad, he proposed a resolution affirming the president's right to do so in principle, but advising the chief executive to consult with congress before exercising this right. Senator Connally was a delegate to the signing of the Japanese peace treaty in San Francisco, Calif., in September. In July he had charged that the Economic Cooperation administration was thinking up ways of spending money in Asia, instead of planning to go out of business when the European Recovery program ended in 1952, and in August he recommended a $1,000,000,000 cut in overseas aid on the grounds that "we cannot go on supporting countries all over the world with handouts just because we like them."

Connecticut.

Popularly known as the "Nutmeg state," the "Land of Steady Habits" or the "Constitution state," Connecticut, next to the smallest of the New England states and one of the 13 original states, has an area of 5,009 sq.mi., including 110 sq.mi. (approximately) of water. The population of the state according to the 1950 official census report was 2,007,280; 77.6% urban, 19.2% rural nonfarm and 3.1% rural farm. Population figures for the principal cities were: Hartford, the capital, 177,397; New Haven, 164,443; Bridgeport, 158,709; Waterbury, 104,477; Stamford, 74,293; and New Britain, 73,726.

History.—The regular biennial session of the general assembly met Jan. 3, 1951, and adjourned June 6. As a result of the previous November elections all the state elective officers were Republican. The governor was John Lodge; lieutenant governor, Edward N. Allen; secretary of state, Mrs. Alice K. Leopold; treasurer, Joseph A. Adorno; comptroller, Fred R. Zeller; and attorney general, George C. Conway. The two United States senators, however, were Democratic, Brien McMahon having been re-elected to a second term, expiring in 1957, and William Benton elected until 1953 to serve the remainder of Raymond E. Baldwin's term.

Supporting the administration was the house of representatives, strongly Republican, 189 seats to 88 Democratic, but the senate was Democratic, 19 seats to 17, and thus had the power of veto on bills and appointments which required passage in both houses. Despite periods of stagnation and deadlock, much worthwhile legislation was enacted through compromise by both parties, some of the most important being: an appropriation from the general fund of more than $223,000,000 (not including highway funds) for the 1951–53 biennium, the largest in Connecticut history; a so-called home rule act, by which towns, cities and boroughs might amend their charters without reference to the legislature; a bill preventing any member of the legislature from holding an appointive office in any other branch of the government; an act establishing a 75-cent statutory minimum wage, but giving wage boards the power to establish higher minimum standards in any industry; a bond issue of $50,000,000 to expand the rental housing program and another of $26,000,000 to be spent on state institutions. A bill allowing the sale of liquor until 11 P.M. on Sundays, and another legalizing bazaars and raffles for nonprofit organizations, were vetoed by the governor.

After adjournment it was discovered that continuation of the Office of Civil Defense had not been authorized. A one-day special session on June 13 corrected this oversight.

During the regular session the two houses of the legislature failed to agree on the method of appointment of minor court judgeships required by a constitutional amendment passed two years previously, the senate claiming that the incumbents appointed by former Gov. Chester Bowles retained their offices and that Governor Lodge's appointments were illegal. The dispute was referred to the supreme court of errors, which on July 30 upheld the legality of Governor Lodge's slate.

Education.—The following statistics for the school year 1950–1951 were issued by the state department of education: there were 680 elementary schools in the state with 6,777 teachers and 216,972 pupils; 34 junior high schools with 838 teachers and 16,461 pupils; 90 high schools with 2,894 teachers and 62,291 pupils; a total of 10,509 teachers and 295,724 pupils. In addition, there were 1,258 teachers and 48,072 pupils in parochial schools and 1,503 teachers and 16,547 pupils in private schools. There were 30 colleges, junior colleges, teachers' colleges and professional schools in the state with 35,311 students. The state supported 12 vocational-technical schools and 9 state-aided schools with an enrolment of 17,197 students. The sum of $12,153,000 was expended by the state on public schools and the total amount of public expenses for public schools was $65,842,000.

Social Insurance and Assistance, Public Welfare and Related Programs.—The state public welfare department reported that in June 1951 there were 68,530 persons in the state receiving some kind of public assistance at a cost of $4,151,113, compared with 73,551 persons and a cost of $3,887,420 in June 1950. The breakdown of the various types of relief was as follows: general local relief was given 11,611 persons who received $494,721; 19,875 persons received old-age assistance at a cost of $1,309,734; aid to 18,535 dependent children cost $703,854; aid was given to 397 blind at a cost of $27,047; aid to 12,557 patients in mental, feeble-minded and tubercular state institutions cost $1,210,923; county wards (6 to 18 years) were 3,472 and the cost was $145,229; state wards (under 6 years) numbered 2,276 and the cost was $43,489.

Table I.—*Principal Crops of Connecticut*

	1951	1950	Average 1940–49
Corn, bu.	1,710,000	1,800,000	2,022,000
Oats, bu.	124,000	140,000	186,000
Hay, tons	449,000	423,000	457,000
Tobacco, lb.	22,111,000	27,806,000	23,688,000
Apples, bu.	1,568,000	1,406,000	1,206,000
Peaches, bu.	156,000	104,000	132,000
Pears, bu.	49,000	56,000	50,000
Potatoes, bu.	2,252,000	2,867,000	3,440,000

Table II.—*Mineral Production of Connecticut*

(In short tons)

Mineral	1949		1950	
	Quantity	Value	Quantity	Value
Clays	289,090	$ 216,029	292,367	$ 236,317
Feldspar	14,178	95,044	15,210	101,851
Quartz	16,225	97,350	27,560	166,810
Sand and gravel	2,648,343	1,587,446	2,998,424	1,861,741
Stone	1,695,650	2,460,547	1,860,700	2,789,532
Other minerals	...	429,821	...	?
Total		$4,886,237		$?

Communications.—According to the Federal Communications commission there were, in Sept. 1951, 26 standard broadcasting stations, 9 frequency modulation stations and 1 television station. Railroad mileage in the state was 830.57. There were 41 airports (13 commercial) and 15 seaplane bases (10 commercial). Motor vehicles registered numbered 798,600 and licensed drivers 874,376.

The mileage in the state highway system was 2,982, 145 mi. of which was divided lane. Gasoline tax receipts and motor vehicle fees were $31,867,000.

Banking and Finance.—As of June 30, 1951, the financial condition of the state, according to the treasurer, was as follows: cash balance (June 30, 1950) $19,042,327.47; receipts $655,273,386.34; total $674,315,713.81. Disbursements amounted to $647,684,626.31, leaving a cash balance on June 30, 1951, of $26,631,087.50. The bonded indebtedness at the end of the fiscal year was $91,380,000. The unemployment compensation fund with the secretary of the treasury was $166,317,276.

The bank commissioner's report showed that as of June 30, 1951, 72 mutual savings banks had assets of $1,541,417,043; 55 state banks and trust companies had assets of $954,411,674; 47 national banks had assets of $890,697,000; 7 industrial banks had assets of $7,110,387; 2 private banks had assets of $1,807,399; and 31 building or savings and loan associations had assets of $73,757,168. All represented large increases over the previous year.

Agriculture.—The department of farms and markets reported that the total cash receipts from farm marketing in 1950 were $143,887,000, compared with $156,294,000 in 1949. From commodity crops, receipts were $48,832,000; from livestock and livestock products, $94,540,000; and government payments, $515,000. *See* Table I for crop production.

Manufacturing.—Employment in nonagricultural industries continued to improve, so that in Aug. 1951 the total reached 808,130 compared with 757,970 in Aug. 1950. Material shortages continued to be the major deterrent to plant expansion. The number of unemployment claims filed in Sept. 1951 was 22,608 compared with 25,400 in Sept. 1950. The average number of hours worked per week was 42.2, the same as in 1950, but the average weekly earnings increased from $60.27 to $66.57. In metalworking the average was $69.94; in nonmetallic manufacturing $58.68; and in construction work $83.39. (J. Br.)

Mineral Production.—Table II shows the tonnage and value of those minerals produced in the state in 1949 whose value exceeded $100,000, and the corresponding data for 1950, so far as they were available at the close of 1951.

Conservation, Soil: *see* Soil Erosion and Soil Conservation.

Consumer Co-operatives: *see* Co-operatives.

Consumer Credit. During 1951 the use of credit by consumers in their purchases of goods and services and in their borrowing of money reflected the continued gradual expansion of retail business, cautious optimism regarding the future and the steady conditions of employment and earning.

The total volume of consumer debt outstanding remained stable for the first time since World War II, being at both the beginning and end of the year approximately $20,000,000,000 and declining during the year to only $19,100,000,000. That stability may be contrasted with a more than 20% increase in such debt during 1950 and with significant increases during every other postwar year. It may also be compared with a 5% increase in personal consumption expenditures during 1951, a 9% increase in personal disposable income and a more than 100% increase in personal savings.

Several factors were responsible for this stability of total consumer debt in the generally expanding economy. First, the buying spree set off by the war in Korea had somewhat slaked the demand for durable goods, and such goods did not thereafter move from merchants' inventories to their accounts receivable as rapidly as they had been moving. Second, the increase in taxes and the continued rise of prices and living costs checked expenditures in some directions. Third, caution on the part of many consumers made them savers rather than spenders. And fourth, restraints of credit control upon buying diverted the purchases of some consumers from items for which they would normally go into debt to others bought out of current income.

Not all forms of consumer credit shared alike throughout the year. Total instalment credit ended the year with about the same amount outstanding as there was at the beginning of the year, while total noninstalment credit increased in amount. In the instalment field, the volume of loans outstanding increased by almost the same amount that instalment sale debt declined. The decline in debt incurred in the purchase of goods occurred in the sales of articles other than automobiles, such as electrical appliances, furniture, etc. Except for the late-winter seasonal decline, automobile credit remained steady. The noninstalment debt, on the other hand, increased in all categories: single-payment loans, charge accounts and service credit.

At meetings of the National Retail Credit association several resolutions were passed. One was that garnishment of wages and salaries of federal employees should be permitted by law. Under existing law, such individuals were immune to garnishment proceedings, and with the growing number of federal employees an increasing group of debtors was placed outside the pale of this legal means of collection. The original intention of the exemption, to protect from harassment those who were performing essential public service, was now thought to give an unjustified advantage to many thousands of persons who were not different from employees of private industry.

A second resolution recommended discontinuance of use of the term "loss" on accounts in connection with uncollectible credits. It was proposed that what had heretofore been regarded as bad debt "loss" be henceforth referred to as "accounts receivable markdown." To the profession this distinction represented a step in the evolution of the credit function from mere guardianship of funds, in which every loss was to be avoided if possible, to the conception of credit as a facilitation of sales, in which case in order to maximize sales, risks of questionable quality were sometimes intentionally accepted with the presumption that a number of the accounts would be uncollectible. Under the latter conception, bad debts were regarded more or less as a sort of sales expense, whereas under the former they were thought of as a loss or reduction of an asset.

A third resolution recommended that regulation W be modified to prevent discrimination against wage earners and farmers and to prevent lowering the standards of living for many people. This resolution expressed the continuing dissatisfaction of the majority of consumer credit managers with federal regulation of credit. The existing regulation, in keeping with changes in business conditions, had been amended four times, effective Oct. 16, 1950, Feb. 26, 1951, May 15, 1951, and July 31, 1951. By the last amendment the time period for all durable consumer goods bought on instalment was increased from 15 to 18 months. Down payments on automobiles were left at 33%, but those required for household appliances were reduced from 25% to 15% and traded-in articles were made acceptable as part of the down payment.

The arguments concerning regulation W put forth by credit managers both condemned and praised the regulation. Foremost among the complaints was the charge that such control of credit was ineffectual in reducing business fluctuation, unless control should really become stringent. Then, it was thought, it would reduce the demand for durable goods in times of prosperity but would not increase it during periods of depression. Credit regulation was also called a weak anti-inflation device, a step toward the destruction of free enterprise and an instance of regimentation of business by government. On the other hand, some managers regarded it as a help to unwise buyers who in uncertain times might overextend themselves, and it was conceived by some as a stabilizing influence in business. (*See* also FEDERAL RESERVE SYSTEM.) (R. BA.)

Canada.—Federal credit curbs imposed on Nov. 1, 1950, did not restrict instalment buying sufficiently to reduce inflation. Accordingly, in March 1951 the federal government further tightened consumer credit by order in council. The new regulations called for an increase of down payment on car purchases from 33⅓% to 50%, increase of minimum down payments on other consumer goods from one-fifth to one-third, increase of minimum monthly instalments from $5 to $10 and reduction of the maximum instalment period from 18 to 12 months. Later in the year the federal government closed several loopholes in the 1950 Consumer Credit (Temporary Provisions) act. The Canadian automotive and electrical goods manufacturers charged that the tougher credit restrictions caused a major slump in sales of their products, and by midyear there were a number of job layoffs in those production fields. Despite growing pressure from industrialists, the federal government by the end of 1951 was resisting demands for relaxation of the controls.

The bureau of statistics released in August its new consumer credit analysis, which showed for the first time the estimated dollar value of retail sales in 13 key trades, with a dollar value as well as percentage of instalment sales and charge account purchases in each trade. Accounts receivable were included for the first time. For the first quarter of 1951 there were total retail sales of $2,155,000,000, of which 8% were on the instalment plan (compared with 7.2% for the first quarter of 1950). (C. CY.)

Great Britain.—The year 1951 saw a considerable change in the field of consumer credit in Great Britain. For the first three months, retail sales appeared to be maintaining satisfactory figures, but by the late spring or early summer reports from all parts of the country, and covering a wide range of goods, showed that purchases were being substantially reduced; with the increased cost of living the lack of money for commodities other than food was the main cause. As a result, short-term retail credit was inclined to fall. The same conditions, however, brought an increase in the amount of instalment-purchase and long-term credit asked for and extended. This was especially so in the case of sales of such items as furniture, refrigerators, cars and radio and television sets. The retailer, faced with falling sales and, generally speaking, ample supplies, found the only way to maintain a reasonable turnover was to provide long-term credit.

Collections, although becoming more difficult in some cases, remained satisfactory on the whole. More care had apparently been used in selecting customers to whom credit was given and more attention paid to the need for keeping such payments to the agreed terms. At the government's request, the banks continued to limit advances to traders to finance long-term credit on consumer goods. This made it difficult for some retailers to handle all the instalment-purchase business offered to them. No new regulation affecting instalment-purchase terms was made. (C. C. WS.)

Contract Bridge.

The consensus of bridge authorities was that during 1951 the game regained some of the following it had lost to canasta in the two previous years. There were no statistics to support this belief; though there had been occasional surveys of the relative popularity of different card games, none was made in 1951. However, bridge instruction books sold better, and bridge teachers reported greater demand for bridge lessons.

Many of the contract bridge tournaments held during 1951 broke previous attendance records, and the national championship play of the American Contract Bridge league, held in Washington, D.C., in August, attracted the largest crowd ever to play in a tournament, comprising about 7,000 gross entries.

There was no change in laws and little development in the technical aspects of the game. The trend to "point-count" rather than "honour-trick" valuation continued, and toward the close of the year even Ely Culbertson, whose system is most widely played, announced that he was translating the requirements for Culbertson system bids into a point-count method—without, however, dropping honour tricks or changing the system.

The U.S. team of Howard Schenken, George Rapee, Samuel M. Stayman and B. Jay Becker of New York city and John R. Crawford of Philadelphia, Pa., again won the world championship match. It defeated the Italian team of Paolo Baroni, Eugenio Chiaradia, Piero Forquet, Mario Franco, Augusto Ricci and Guglielmo Siniscalco, who had won the championship of the European Bridge league, in a match of 320 deals played at Naples, It., in November. Julius L. Rosenblum of New Orleans, La., acted as nonplaying captain of the U.S. team and Carl Alberto Perroux of the Italian team.

Winners of the principal championship contests of the American Contract Bridge league in 1951 were:

Masters' individual: Sidney Silodor, Philadelphia.

Masters' teams: Silodor and Charles H. Goren, Philadelphia; Mrs. Helen Sobel and Myron Field, New York city.

Masters' pairs: Peter A. Leventritt and Richard Kahn, New York city.

Open teams, cumulative scoring (Vanderbilt cup): Crawford, Stayman, Rapee and Becker.

Open teams, match-point scoring: Corti Boland, C. B. Elliott, M. M. Miller and P. E. Sheardown, Toronto, Ont.

Open pairs: Arthur Glatt and Albert Weiss, Chicago, Ill.

(A. H. MD.)

Great Britain and Europe.—In Great Britain the winners of the principal competitions were:

Waddington cup for masters' pairs: R. Swimer and R. Preston.

National pairs: J. T. Reese and A. Meredith.

Gold cup: L. Tarlo (captain) and N. Gardener, L. Baron and A. Rose.

Crockford's cup: J. Pavlides (captain) and L. Dodds, K. W. Konstam and G. Mathieson.

The Camrose trophy, played between the countries of Great Britain, was won by England, with Scotland runner-up. The Contract Bridge Association of Ireland announced that its team would not enter for this contest in future.

The European championship was played at Venice, It., and was won by Italy. Austria was second, Great Britain third, Egypt fourth and Sweden fifth. The ladies' championship was won by Great Britain, with Denmark second. (T. REE.)

Co-operatives.

During 1951 the International Cooperative Petroleum association, with headquarters in New York city, proposed to the governments of Iran, Great Britain and the United States that it take over operation of the Anglo-Iranian Oil company refinery at Abadan in order to prevent huge continuing losses resulting from the stoppage of the refinery. The proposal was not accepted, although the Iranian government indicated its willingness to accept the offer. The development, however, spotlighted the growth of the world oil co-operative which during the year served 23 central co-operative associations in 13 countries from Sweden to Australia.

U.S. consumer co-operatives in the petroleum industry continued to grow. Approximately 2,300 local co-operatives distributed 1,400,000,000 gal. of fuel, primarily to farmers. This represented 2.25% of the total domestic consumption of petroleum products. Co-operatives' savings to members in 1951 were estimated at a little more than the $23,000,000 returned to co-operative oil customers in 1950.

Fourteen regional co-operative associations owned 20 refineries with a combined output of 144,500 bbl. a day. The co-operatives also owned 1,600 oil wells and held under lease 63,000 ac. of proved oil producing lands and 310,000 ac. of prospective oil lands. Nearly 1,000,000 farm and city consumers owned these petroleum resources co-operatively.

Co-operative credit unions continued their spectacular growth by adding nearly 100 new credit co-operatives a month during the year. This brought credit union membership to a total of 6,000,000 in the U.S. and Canada in 12,000 local associations.

Rural electric co-operatives added 68,000 mi. of lines and 250,000 new consumer-owners in 1951. Power use increased 14%. Electric co-operative members totalling 3,500,000 were $41,500,000 ahead of schedule in repaying loans to the Rural Electrification administration.

During the year 54 telephone co-operatives took steps to modernize and streamline their operations for about 100,000 subscriber-owners. This telephone co-operative modernization program was also under the sponsorship of the REA.

Co-operative housing associations under the new co-operative section of the Federal Housing administration completed their first few units in 1951. At the year's end approximately $60,000,000 worth of co-operative housing was under construction, and FHA had received applications for more than $300,000,000 worth of this type of housing. The Federal National Mortgage association was authorized by congress to make advance commitments for $30,000,000 worth of co-operative housing mortgages, thereby easing the mortgage squeeze which had hit co-operative and other housing. Prior to the initiation of the FHA program 30,000 United States families were already living in approximately 100 co-operative housing projects.

The consumer food store field saw the opening of several large supermarkets during the year, and business volumes of established food co-operatives continued to grow. This section of the co-operative movement was still small compared with other fields of co-operation, but included about 1,000 food stores with business totalling about $100,000,000 annually. During the year the Cooperative League of the U.S.A. brought together about 30 managers of $1,000,000 retail consumer co-operatives which were setting the pace in food distribution.

The insurance companies, members of the Insurance Conference of the Cooperative League, reported gains in policyholdings and memberships. The largest group in the field, the Farm Bureau Insurance companies with headquarters in Columbus, O., marked their 25th anniversary by moving into a $6,000,000 headquarters building. During 1951 the Farm Bureau group served about 1,500,000 policyholders in 12 eastern states.

Co-operative health associations and co-operative hospitals were reported to the U.S. senate committee on health and public welfare as a possible pattern for a "middle way" in the health field; but opposition to consumer-owned health services by the American Medical association continued. In the state of Washington the Puget Sound Cooperative Health association was forced to go to the state supreme court for a decision which acknowledged the right of consumers to control and operate a medical service. Health associations affiliated with the Cooperative Health Federation of America reported a membership of 600,000. An additional 5,000,000 consumers were served by labour union health programs and other nonprofit associations.

The largest co-operative activity in the U.S. was the marketing of farm products. Activities in such fields as cotton, dairy products, fruit and vegetables, grain, dried beans, rice, livestock, nuts, poultry, tobacco, wool and other products brought together 3,600,000 farmers. Their marketing activities covered nearly $8,000,000,000 worth of commodities.

Co-operative purchasing of farm supplies—feed, seed, fertilizer and other essentials—affected a membership of 2,260,000 farmers. The total business of these farm supply co-operatives was about $1,500,000,000.

Underlying and essential to all of these co-operative activities were: (1) ownership of the associations by the consumer or producer members; (2) democratic control based on each member having one vote; and (3) nonprofit operation. These had been cardinal principles of co-operative enterprise for more than a century.

Near the close of the year the U.S. congress changed the tax laws affecting co-operatives, virtually eliminating the exemption of farmer-owned co-operatives from federal income tax. That change placed all co-operatives on an even footing with other types of business enterprise as far as the tax laws were concerned. (*See* also FARM CREDIT ADMINISTRATION.) (W. J. CL.)

International Co-operative Alliance.—The International Co-operative alliance held its 18th congress at Copenhagen, Den., in Sept. 1951. The affiliated membership was 100,000,000 in 30 countries. This total was made up of 52,990 consumers' societies and 40 wholesale societies with 59,348,000 members; 11,560 industrial producers' societies with 749,000 members; 70,530 agricultural societies with 17,801,000 members; 225,500 credit societies and 16 co-operative banks with 18,333,000 members; and a number of miscellaneous bodies with 1,944,000 members. Among the nonaffiliated movements were those of China, Hungary, Poland, the British colonies (except Jamaica) and most of Latin America; and there were many unaffiliated bodies in other countries. The I.C.A., however, still included the co-operative movements of the Soviet Union, Bulgaria, Czechoslovakia and Rumania, as well as those of the countries outside the soviet sphere of influence. The countries of the soviet group retained their connection with the I.C.A. despite its domination by the western movements. At Copenhagen the conflict between the two blocs came to a head. The action of the central committee in prescribing conditions for new affiliations in such terms as to rule out the co-operative movements of the soviet countries was challenged by the Russians, the Italians and other groups, but the committee's action was upheld by 623 votes to 353. This involved the rejection of the applications for admission of the new co-operative Polish organization and also of that of the co-operative movement of eastern Germany. The ground for exclusion, laid down in the committee's regulations and approved by the congress, was that "free" co-operative movements could not exist in totalitarian countries. The soviet group also endeavoured to persuade the I.C.A. congress to adopt a peace resolution corresponding to the terms of the Communist peace campaign; but the congress adopted a resolution embodying specific references to the need for freedom of speech, movement, organization, real democratic elections, co-operative independence and action through the United Nations in the spirit of the Atlantic charter. Other issues dealt with at the congress included the need to adapt the I.C.A. more effectively to meet the needs of the agricultural co-operative movement, for which a special section was set up; the demand for effective action on a world-wide scale against restrictive monopolies and for the nationalization of commodity distribution; proposals for the development of international co-operative trade and for the removal of hindrances in the way of the international co-operative trade in petroleum products and projects for the expansion of co-operative educational activities. During the year Thorstein Ohde resigned his position as director of the I.C.A. and was succeeded by W. P. Watkins.

Great Britain.—At the end of 1950, British retail consumers' societies had 10,691,000 members, as against 10,413,000 at the end of 1949. Average dividend rates continued to fall—from 1*s.* 4½*d.* in the £1 in 1949 to 1*s.* 3½*d.* in 1950. The English Co-operative Wholesale society's trade rose from £291,000,000 to £321,500,000, and that of the Scottish C.W.S. from £62,000,000 to £68,000,000.

At the general election of Oct. 1951 the Co-operative party, fighting in alliance with the Labour party, put forward 38 candidates, of whom 16 were successful, as compared with 18 in 1950.

Other Countries.—In the British colonies, notably West Africa and the West Indies, co-operation continued to expand with government encouragement. The west German movement also continued to regain its strength, but attempts to re-establish unity with the movement in eastern Germany met with no success. In Yugoslavia there was a considerable liberalization of co-operative policy, as the pressure for collectivization was further relaxed. The Chinese movement was brought more fully under Communist control. The Italian movement remained predominantly under Communist influence.

FILMS OF 1951.—*The Rising Tide* (National Film Board of Canada). (G. D. H. C.)

Copper.

Increased demand pushed world copper production up by 11% in 1950, reaching a level almost equal to that of 1944. Of the major producers only Chile and Cyprus had small decreases.

Table I.—*World Mine Production of Copper*

(Thousands of short tons)

	1944	1945	1946	1947	1948	1949	1950

For comparison with Table I, as reported by the U.S. bureau of mines, a comparable table of smelter output will be found in the article MINERAL AND METAL PRODUCTION AND PRICES.

United States.—The salient statistics of the copper industry in the United States, as reported by the U.S. bureau of mines, are shown in Tables II and III.

Mine and smelter outputs increased by 20% in 1950, and refinery output advanced 33% over 1949, the difference being supplied by a 47% increase in imports of crude copper. In addition, there was a 15% increase in refined copper which, added to the other advances, gave a 32% rise in the available supply. The 1950 advance in mine production continued through the third quarter, with a total of 697,971 tons, equivalent to an annual rate of 930,400 tons.

Table II.—*Data of Copper Industry in the U.S.*

(Thousands of short tons)

	1945	1946	1947	1948	1949	1950
Mine output	772.9	608.7	847.6	834.8	752.7	907.0
Smelter output	782.7	599.7	862.9	842.5	757.9	911.4
Refinery output	1,108.6	878.7	1,160.0	1,107.4	927.9	1,239.8
Domestic ore	775.7	578.4	909.2	860.0	695.0	920.7
Foreign ore	332.9	300.2	250.8	247.4	232.9	319.1
Secondary recovery	1,006.5	803.5	961.7	972.8	713.1	940.0
From old scrap	497.1	406.5	503.4	505.5	383.5	474.0
From new scrap	509.4	397.1	458.4	467.3	329.6	466.0
Imports	853.2	393.3	413.9	507.4	552.7	690.2
Refined	531.4	154.4	149.5	249.1	275.8	317.1
Exports	132.6	97.5	197.0	207.0	196.0	192.9
Available for use*	2,004.5	1,342.1	1,615.9	1,655.0	1,391.2	1,838.0

*Available for use includes total refinery output, secondary from old scrap, and refined imports less exports; secondary from new scrap is only a turnover of metal in process and does not add to the supply available for use, and other imports have been covered in refined output from foreign ores.

Total	772.9	608.7	847.6	834.8	752.8	907.0

Canada.—Primary copper output in Canada dropped from 263,457 tons in 1949 to 262,865 tons in 1950, but refinery output rose from 226,083 tons to 240,143 tons. (G. A. Ro.)

Corn

The U.S. corn crop of 1951, because of its reduced size (2,941,423,000 lb.), was a cause of much official concern in view of the large and increasing livestock population dependent on it. The spring was cool and wet over much of the corn-producing area; farmers planted only 83,306,000 ac.—not the officially suggested 90,000,000 ac. Floods in the Kansas area led to unusual acreage abandonment. There was some drought damage in an eastern area. Frost caught about one-third of the crop in the important northwest quarter of the corn belt, resulting in light-weight grain and wet corn difficult to store; a wet and snowy autumn much delayed the harvest and the curing of the crop.

Table I.—*U.S. Corn Crops*

	1951	1950	1949	Average, 1940–49
Total production (thousands of bu.)	2,941,423	3,057,803	3,379,436	2,980,777
Acreage harvested (thousands)	81,306	81,817	87,029	87,882
Yields (bu. per acre)	36.2	37.4	38.8	33.9

Average prices increased from a low of $1.54 per bushel at the farm early in the year to about $1.80 per bushel late in the year, the highest price level since 1948. The probable value of the crop was estimated at $4,934,921,000, as compared with $4,679,612,000 for the larger crop of 1950.

Exports were preliminarily indicated at 85,000,000 bu., as compared with 108,000,000 bu. in the previous year. A national production goal of 3,375,000,000 bu. and an acreage goal of 89,000,000 was officially recommended for 1952. The carry-over on Oct. 1951, from the previous crop declined to about 670,000,000 bu. (of which about 400,000,000 bu. were held by the Commodity Credit corporation), and the carry-over at the beginning of the next crop year, Oct. 1, 1952, was estimated at about 400,000,000 bu.

World corn production for 1951–52 was preliminarily estimated at about 5,400,000,000 bu., larger than the 5,240,000,000 bu.

Cortisone and ACTH.

Cortisone is a crystalline hormonal steroid isolated from extracts of the adrenal cortex by E. C. Kendall of the Mayo foundation (Rochester, Minn.) in 1936. T. Reichstein of the University of Basle, Switz., described it independently. L. H. Sarett of the research laboratories of Merck & Co., Inc. synthesized the product from a bile acid in 1946. Cortisone was first used on patients by Philip S. Hench and his associates at the Mayo clinic in 1948.

The adrenocorticotropic hormone ACTH is derived from the pituitary gland; it stimulates the cortex of the adrenal gland to activity which results in the production of hormones. These include Compound E which is cortisone, Compound F which is hydrocortisone and about 25 others. ACTH was discovered by J. B. Collip, H. M. Evans, G. Sayers and C. H. Li.

The pituitary hormone is secreted in response to nervous stimuli; apparently certain hormones act on the hypothalamus causing it to stimulate the pituitary. According to George W. Thorn, an autoregulatory mechanism involves action by circulating steroids from the adrenal cortex to inhibit the secretion of ACTH by the pituitary.

The adrenocortical hormones act to regulate the use of sodium, potassium and chlorides in the body. They regulate the water balance. They regulate the quantity of carbohydrate, protein and fat entering into the chemistry of the body and are concerned in the formation of blood cells and of lymphoid tissue. They are involved in sexual anatomy and physiology and in the pigmentation of the body.

The relationship of adrenal hormones to sex function is reflected in symptoms attributable to increased androgenic function that may appear with large doses of cortisone. Excess hair, acne, a deepened voice and disturbances of menstruation in women are among the conditions observed. Lessening of dosage or discontinuance brings about disappearance of the unfavourable symptoms.

Relation of Stress to Cortisone.—The reasoning of Hans Selye and his concept that includes the alarm reaction; the shock phase; the countershock phase; and the general adaptation syndrome startled scientists everywhere.

Simply stated, when living bodies are subjected to various forms of stress, the body reacts. As depicted by George W. Thorn, stress or emergency causes the adrenal medulla to send epinephrine to the hypothalamus, which is also subject to stimuli coming from the cortex of the brain. The hypothalamus causes the anterior pituitary to send ACTH to the cortex of the adrenal which elaborates the necessary steroid hormones. Selye postulated overreaction to the stress which leads to a variety of diseases of adaptation—of which rheumatoid arthritis and lupus erythematosus might be considered examples.

Philip S. Hench noted that jaundice and pregnancy bring about remissions in rheumatoid arthritis, whereas they do not influence favourably the course of proved bacterial or virus infections. This led him to the concept that the substance responsible for relief must be a hormone common to both men and women. The earliest observations revealed striking and rapid improvement in rheumatoid arthritis with subsequent demonstrations of similar benefit in acute rheumatic fever, rheumatic spondylitis, disseminated lupus erythematosus, periarteritis nodosa, arthritis associated with psoriasis, gout and dermatomyositis.

The administration of cortisone can cause impairment of tolerance for carbohydrates. Large doses of cortisone induce a rather decided loss of nitrogen from the body, indicating an increase in catabolism of protein. Pronounced creatinuria (an abnormal excretion in the urine) was also noted, indicating increased breakdown of protein. Ketonuria (disturbed handling of fat by the body) was also observed; cortisone exerts an influence on use of fat by the body. Rounding of the contour of the face and transient obesity with abnormal distribution of fat as seen in Cushing's disease are evidences of cortisone activity.

Rheumatoid Arthritis.—The approach to rheumatoid arthritis before the advent of cortisone was complicated and utilized a variety of forces. Drug therapy involved the trial of salicylates, gold, cinchophen, analgesics, sedatives, counterirritants, adequate nutrition with proteins, vitamins and mineral salts; the entire gamut of physical medicine with heat, massage, radiation and other techniques; specific anatomic correction and support under the guidance of the orthopaedic surgeon; and psychosomatic therapy.

The era of the concept of focal infection brought about elimination of all spots of infection.

Neither cortisone nor any other substance known can restore tissue that has been destroyed or repair irreversible articular damage.

Eminent clinicians emphasized that cortisone extends rather than curtails the use of physical measures in the treatment of rheumatoid arthritis. Physical therapy is particularly helpful when the limitation of movement can be reversed. Cortisone acts on fibrous tissue to diminish stiffness and to lessen joint swelling and tenderness. As the range of motion is increased the physical therapist helps restore strength and re-educate muscle action. The sense of well-being associated with the use of cortisone gives the depressed patient a new outlook on life and encourages him to try to do more for himself. Restoration of bedridden patients to ambulation is one of the most dramatic results of the new era in rheumatoid arthritis.

Later techniques recommended small doses over a long period of time.

Collagen Disorders.—The diffuse collagen disorders include polyarteritis nodosa, disseminated lupus erythematosus, scleroderma and dermatomyositis. Also associated with this group are acute rheumatic fever, serum sickness, rheumatoid arthritis, thromboangiitis, obliterans, erythema nodosum and multiforme, and anaphylactoid purpura. Clinical reports claimed beneficial effects from the administration of cortisone in practically all these conditions.

Acute Rheumatic Fever.—Enough research was done on the treatment of rheumatic fever with cortisone or ACTH or both in 1951 to establish the conviction that these substances could suppress the manifestations of the disease that used to make it almost invariably fatal or permanently crippling.

No routine of treatment with cortisone or ACTH, however, could be established for rheumatic fever. Again the dosage seemed to be related more to the severity of the condition than to the age or weight of the patient. Neither cortisone nor ACTH cures rheumatic fever, nor do they shorten the duration of the state of rheumatic activity. They prevent intensive exudative and inflammatory reactions in the body and therefore prevent the fibroblast proliferation and subsequent scarring of such vulnerable tissues as the cardiac valves, which ordinarily follows.

Inflammations of the Eye.—Many ocular diseases are accompanied by inflammation and exudation and the subsequent keratitis damages eyesight or even results in blindness. Sympathetic ophthalmia has long been among the most feared of conditions. The inflammation and exudation that occur in tubercular, syphilitic and other ocular infections, allergic keratitis and nongranulomatous iritis are the damaging factors. The action of cortisone is not specific. Its effect is a general one preventing the damage and maintaining the functional integrity of the eye. Associated with cortisone the specific antibiotic or other necessary forms of treatment may be used. Research showed that cortisone has value in cases of retrolental fibroplasia, haemorrhagic retinitis and exudative retinitis.

Psychic Disturbances.—Cortisone had been tried in a number of mental disturbances by 1951. Recovery seemed to be hastened in alcoholism and in delirium tremens, and the pathologic changes in these conditions seemed to warrant trial. Treatment in drug addictions yielded interesting responses; effects are of course more permanent when proper psychiatric treatment accompanies use of cortisone. Trials with schizophrenia were puzzling.

Excess of cortisone may be associated with nervousness proceeding even to mild psychotic disturbances. Stopping the hormone may not be followed by immediate improvement. Patients with abnormal personalities are more likely to have reactions toward psychosis than are more stolid types.

Cortisone was found to be effective in many cases of haemolytic anaemia and thrombocytopenic purpura. Benefit was also reported in several clinics in severe cases of ulcerative colitis treated with ACTH or cortisone or both. Cosmic Rays: *see* PHYSICS.

Costa Rica.

A Central American republic, Costa Rica is located between Nicaragua and Panamá. Area: 19,238 sq.mi.; pop. (preliminary figures, 1950 census of the Americas): 794,000, classified as about 80% white, 16% mixed, 3% Negro and less than 1% Indian. The capital is San José (1949 pop.: 79,694); other principal cities are Alajuela (11,187), Cartago (11,624), Guadalupe (15,966), Heredia (10,730), Liberia (3,061), Limón (12,666), Puntarenas (12,329), Tibás (5,227) and Turrialba (5,316). Language: Spanish; religion: predominantly Roman Catholic. President in 1951: Otilio Ulate Blanco.

History.—Some progress toward stability and constitutional government was discernible during the year, although 1951 did see an attempt to overthrow the Ulate government. A major milestone in the return to domestic peace, following the civil war of 1948, was passed on March 4 when *La Tribuna* of San José resumed its daily publication after three years of suspension. An editorial foe of President Ulate, *La Tribuna* continued to criticize him. The administration announced on April 4 that it had frustrated another plot to unseat Ulate. The aborted coup, the government said, was directed by former Pres. Rafael Angel Calderón Guardia (1940–44), operating from his Mexican exile. Quantities of arms and munitions were seized and 48 persons were jailed in connection with the affair. On July 12 a court order dissolved four allegedly Communist-dominated trade unions—the National Aviation Workers, the Public Works Ministry Employees, the Municipal Workers of San José and the Social Security Nurses and Medical Aides—charged with engaging in political activities outside their labour functions. Acting as Pres. Harry S. Truman's personal representative, Assistant Secretary of State Edward G. Miller, Jr., in September conferred the U.S. Legion of Merit award on President Ulate for his "exceptionally meritorious conduct" in governing Costa Rica democratically. (G. I. B.)

Education.—In 1951 there were 1,139 public and private primary schools with 4,821 teachers and 116,157 pupils. In 1950 there were 8 public secondary schools, 16 private schools and 7 technical schools. University education was available at the University of Costa Rica. In 1950, 15% of the budget was expended on education. There were 92 motion-picture theatres in 1951 with seating capacity of 43,000.

Finance.—The monetary unit is the colón, valued at 17.64 cents U.S. currency, controlled rate, and 13.48 cents, uncontrolled rate, on Nov. 14, 1951. The national budget for 1952 as introduced provided for expenditure of 143,500,000 colones (1951 as authorized: 134,928,691 colones). Revenue in 1950 was 137,987,150 colones; expenditure, 126,129,039 colones, thus leaving a record surplus of 11,858,111 colones. The public debt on Dec. 31, 1950, was 403,504,340 colones, of which 161,007,368 colones represented the external debt. Currency in circulation on July 31, 1951, was 97,900,000 colones; commercial deposits 113,500,000 colones; gold reserves $2,040,000. The cost-of-living index (San José) stood at 273 in Oct. 1951 (1937=100).

Trade.—Exports in 1950 amounted to $34,689,235; imports, $46,032,968. Chief exports were coffee (51%), bananas (30%), cacao (6%) and abacá (4%). Leading customers were the U.S. (71%), the Netherlands (8%), Italy (6%) and Canada (4%); leading suppliers, the U.S. (67%), the United Kingdom (5%), Canada (5%) and Germany (4%). Important imports included textiles, machinery, instruments and vehicles, wheat flour and fertilizers.

Communications.—Railroad trackage included 410 mi. of public railway and 250 mi. of private railway. On Dec. 31, 1948, there were 1,015 mi. of highway, of which 926 mi. were all-weather roads. Registered motor vehicles on Jan. 1, 1951, included 4,645 automobiles, 2,308 trucks and 810 buses. In 1950 domestic air line flights carried 124,000 passengers and 14,700,000 lb. of cargo; international flights, 42,000 passengers and 1,600,000 lb. of cargo.

Agriculture.—Coffee production in the 1949–50 season was 386.449 bags of 132 lb. each, of which 317,600 bags were exported. The 1950–51 crop totalled 335,332 bags. Exports of other crops in 1950 included bananas 10,198,042 stems, of which 9,244,409 went to the U.S.; cacao 48,028 short tons; and abacá 2,896 tons. The 1950 census showed 610,757 cattle. In 1950, 49,449 short tons of fresh frozen tuna were exported.

Cotton.

Cotton Manufacture.—The cotton manufacturing industry experienced an "inventory" recession in the U.S. during the last part of 1951. Heavy demand resulting from military requirements and "scare buying" following the outbreak of the Korean war carried over into early 1951, but before midyear, inventory liquidation became the order of the day. Pricing problems of the industry were complicated not only by surplus in stock but by wide and unexpected swings in raw cotton prices. Mill activity dropped to about 60% of capacity. Spinning, which operated in January at 145.9% of capacity, had declined to 124.1% in October. Of 23,182,000 spindles in place, 20,294,000 were actively consuming cotton in November, as compared with 20,900,000 in February.

Cotton goods produced through September totalled 7,770,093,000 yd.; it was estimated that the total for the year would be about 9,750,000,000 yd., as compared with 9,887,344,000 yd. in 1950. Military procurement required about 10% of the output, and cotton cloth exports, estimated at a probable 775,000,000 sq.yd. for the year were about 14% more than in 1950. The manufacturing of cotton tire cord and fabric expanded substantially in the latter half of the year; at 79,000,000 lb. it was 20% and 9% larger than in the first and second quarters of 1951.

United States Production.—Though the early promise of a very abundant cotton harvest gradually faded as the season progressed, the U.S. cotton crop of 1951 was a large one of 15,290,000 bales (of 500 lb. gross weight), as compared with only 10,012,000 bales in 1950 and an average for 1940–49 of 12,030,000 bales. On conditions as of Sept. 1, when 2,014,444 bales of the crop were reported as already picked and ginned, a total crop of 17,291,000 bales was forecast; in October this was dropped to 16,831,000 bales, in November to 15,771,000

Table I.—*U.S. Cotton Production by States*

(In thousands of 500-lb. bales)

State	1951	1950	Average, 1940–49
Texas	4,100	2,946	3,049
California	1,770	978	584
Mississippi	1,620	1,332	1,644
Arkansas	1,255	1,090	1,414
Georgia	935	488	738
Alabama	920	575	919
Arizona	860	474	222
South Carolina	860	405	707
Louisiana	765	426	527
North Carolina	550	181	579
Tennessee	540	409	559
Oklahoma	450	242	511
Missouri	320	254	375
New Mexico	284	187	151
Florida	35	14	14
Virginia	16	4	24
Other states	10	7	16

bales and in December to 15,290,000 bales. It was indicated in December that the July 1 estimate of 29,510,000 ac. in cotton cultivation on that date was for certain reasons about 5% too high, the corrected figure being 27,997,000 ac. as of that date, about 50% more than in 1950 and to be compared with a 1940–49 average of 22,158,000 ac. The revised July 1 acreage estimate was thus somewhat less than the minimum acreage guide of 28,536,000, which had been announced. Acreage allotments had been removed on the 1951 crop, because a crop much larger than the very small one of 1950 was officially desired. The acreage actually harvested was estimated at 26,698,000, as compared with only 17,843,000 in 1950 and an average for the previous decade of 21,622,000. Yields of lint of 274.5 lb. per acre were slightly more than in 1950 (269.0 lb.) and the 266.0-lb. average for 1940–49.

Abnormal weather in May and June apparently led to some early season abandonment. Severe drought in August and early September contributed to further abandonment, and low temperatures and rain delayed late-season harvesting in some areas.

The 1951 crop of long-staple American Egyptian cotton, much of it produced under irrigation in the southwest, was only 46,300 bales, as compared with 64,200 bales in 1950 and an average for the decade of 24,400 bales. Yields of 365 lb. were high compared with 298 lb. in 1950 and an average of 301 lb. for the previous decade.

Acreage was reduced to 60,700, as compared with 103,200 ac. in 1950.

U.S. cotton prices fluctuated sharply during 1951, but at levels above those provided for by government supports (30.46 cents per pound for 1951 as compared with 27.9 cents per pound in 1950, middling $\frac{7}{8}$-inch upland cotton), and were lower and more stable than world prices. Early in the year prices received by farmers were as high as 43.17 cents per pound, the highest level since the Civil War period. After a ceiling was placed on cotton beyond the farm level at about 45.76 cents per pound, prices declined substantially during the summer on the prospect of a big crop, only to rise abruptly as crop estimates declined late in the season after part of the crop had been sold to producers. The average season price received by farmers was estimated at 37.6 cents (40.07 cents in 1950), and the value of the lint was estimated at a total of $2,877,928,000, as compared with $2,005,169,000 for the small crop of 1950.

Table II.—*Cotton Production of the Principal Producing Countries*

(In thousands of 500-lb. bales)

Country	1951	1950	Average, 1935–39

COTTON CROP in the United States. The figure for 1951 is the department of agriculture's estimate

Cotton exports from the U.S. in 1950–51 were 4,117,000 bales; there was some preliminary indication that as many as 6,000,000 bales might be exported in 1951–52. Thus, in summary, a supply consisting of a carry-over from the previous crop of 2,200,000 bales, plus a new crop of nearly 15,300,000 bales, would support a domestic consumption of at least 9,500,000 bales (earlier estimated at from 10,000,000 to 10,500,000 bales), which would mean that export must be held below the earlier estimate (6,000,000 bales) if the carry-over on Aug. 1, 1952, was not to fall below the very low one of 1951. In consequence of the probable tight situation, the official goal recommended for the 1952 crop was 16,000,000 bales and 28,000,000 ac. in cotton cultivation on July 1, 1952. Export controls had not been reimposed at the end of 1951.

World Cotton Production.—Early indications pointed toward a 23% increase in world cotton production in 1951–52, as compared with 1950–51, or 33,800,000 bales compared with 27,600,000 bales. The crop plus the carry-over gave a total supply of about 42,000,000 bales, 5% below the preceding year.

World cotton prices fluctuated widely during 1951. In March, when a ceiling was put on U.S. prices, world prices were about 30 cents per pound higher. Mexican and Brazilian cottons sold for more than 70 cents per pound and better grades of Egyptian cotton for more than $1 per pound; Mexican cotton later declined to a level near U.S. prices, Brazilian to a low of 43.5 cents per pound and Egyptian cotton to 56.6 cents per pound. All recovered sharply in the late months of the year.

World cotton consumption in 1950–51 rose to 32,800,000 bales, 12% more than the 29,300,000 bales for the previous year, a considerable part of the increase apparently going into inventory accumulation. Raw cotton stocks in all countries as of July 1951 were estimated at 11,000,000 bales, as compared with 16,600,000 bales a year earlier. Thus a decline in stocks of 5,600,000 bales nearly matched the indicated 6,200,000 bales increase in production.

World trade in cotton in 1950–51 was considerably limited by restrictions on supplies and high prices, yet was near 12,000,000 bales, as compared with 12,500,000 bales in 1949–50.

Cottonseed.—The U.S. cottonseed crop of 1951 was estimated at 6,186,000 tons, as compared with only 4,105,000 tons in 1950 and an average of 4,900,000 tons for 1940–49. Such abundance of raw material for oil (largely used in margarine production) and of high-protein cake for livestock feed resulted in an estimated price to farmers of only $69.90 per ton, as compared with $86.40 per ton in 1950; a total value for 1951 cottonseed of $432,348,000, and, for 1950, $354,543,000. Cricket.

In the winter of 1950–51 a Marylebone Cricket club team visited Australia and New Zealand, and a commonwealth side toured India, Pakistan and Ceylon. The former had the satisfaction of winning a test match in Australia for the first time since Dec. 1936, and though this was achieved only in the last of the five matches, it was generally agreed that the difference between the two sides was not so great as those figures would suggest. At Brisbane, rain determined the result of the first match, which Australia won by 70 runs. The second game, at Melbourne, was a splendid fight and Australia won by 28 runs. At Sydney, England's fate was sealed in the third test by an innings and 13 runs, and K. R. Miller and J. Iverson dominated the game. The fourth test, at Adelaide, brought Australia another decisive victory by 274. In the last test, at Melbourne, England won by 8 wickets.

On the short New Zealand tour that followed, two test matches were played: the first was virtually confined to one innings by each side—New Zealand 417 for 8 declared, M.C.C. 550—but the M.C.C. won the second by 6 wickets, largely because of the bowling of R. Tattersall who had been flown to Australia a month earlier.

The chief feature of the 1951 English season was the visit of a South African team under the captaincy of A. D. Nourse. They won the first test match at Nottingham by 72 runs. In the second game, at Lord's, fate dealt roughly with the visitors, for after they had done well enough to dismiss England for 311, heavy rain on the next day produced a wicket on which they could find no effective answer to Tattersall's accuracy and spin and England won by 10 wickets. If this match was Tattersall's—his final figures were 12 for 101—the third, at Old Trafford, Manchester, was Bedser's with 12 for 112. On a wicket that always gave the bowlers help, E. A. B. Rowan's 57 in South Africa's second innings was the highest score on either side until, on the last morning, Hutton (98 not out) piloted England comfortably home by 9 wickets. At Leeds in the fourth test South Africa found a true and fast wicket and never looked like being beaten. In making 236 in nine and one-fourth hours, Rowan beat the South African test-match record and their total reached 538 against some very poor bowling. To England's reply of 505 Hutton contributed 100 and P. B. H. May a most impressive 138 in his first test-match innings. At the end of the fourth day South Africa were 87 for no wicket, Rowan 60 not out, but then came rain and there was no more play. The fifth match at the Oval was played throughout at a pitch that, though reasonably fast, helped the spin bowlers and so produced a fascinating game with the balance between bat and ball very even. In the end England won by 4 wickets.

In the county championship, Warwickshire won a decisive and popular victory exactly 40 years after their only previous success, and the runners-up were Yorkshire. Lancashire, after threatening to challenge, fell away in August.

As in 1950, the Gentlemen and Players match produced some most interesting cricket, and in the end the Players won by 21. Oxford upset all expectations by defeating a much-heralded Cambridge side by exactly the same margin and less than 20 minutes from time. Eton college, after completely outplaying Harrow school until tea time on the second day, were in the end just foiled. (H. S. A.)

Crime.

United States.—For the third successive time, both urban and rural crimes increased during the first half of the year. The rise was not by any means uniform either as to areas or types of crime, but there was no mistaking the general result. The amazing increase of negligent manslaughters (chiefly motor vehicle homicides caused by criminal negligence) recorded in the cities during 1950 was extended into rural areas during the first six months of 1951. Auto thefts and other larcenies also rose in striking fashion, while robberies in both city and country showed gratifying declines. Since 1950 had likewise compared favourably with 1949 in the number of robberies recorded (an even 10% reduction for rural and urban areas combined), the tendencies for this one offense classification were definitely on the favourable side.

Crime Changes in U.S. Cities and Rural Areas—January to June 1950 and 1951

Offense classification	Per cent change in 1951	
	Cities	Rural areas
Murder and nonnegligent manslaughter	− 6.1	− 7.4
Negligent manslaughter	− 3.2	+21.3
Rape	+ 6.0	− 2.4
Robbery	− 8.4	−21.8
Aggravated assault	− 1.9	− 9.4
Burglary	− 3.2	− 5.2
Larceny	+ 7.9	+12.9
Auto theft	+18.6	+20.0
Total	+5.1	+4.0

Yet the grand total of crimes reported on a nation-wide basis continued at such high levels as to emphasize the burdens that criminal acts impose upon the economy. With 170,000 auto thefts, more than 1,000,000 other larcenies, 412,000 burglaries and other crime classifications in lesser numbers, there was no basis for congratulation. Although rural crimes continued for the most part at a substantially lower rate than was recorded for cities, the property of the average urban dweller was a special target. Thus for each 1,000 urban residents, the first half of 1951 witnessed one auto theft, five other larcenies and two burglaries. These figures are roughly doubled when extended to an annual basis, and serve to emphasize the continuing economic and social importance of better crime control.

Total property losses in 1950 soared 20% above those for 1949, with the average value per offense increasing in generally comparable fashion. Inflationary influences on property values cannot alone explain this marked rise, and it seemed apparent that, as in former "boom" years, both the number of crimes and the financial returns to the offender increase during periods of bulging pay envelopes and free and easy spending. Property recoveries declined to 60.2% in 1950 from the 62.4% restored to owners in 1949. As usual, about 85% of all recovered property was represented by motorcars. Only 12% of stolen currency was restored and but 6% of the value of stolen furs.

Southern states had the highest per capita rates for crimes against the person, with the Pacific coast and Rocky mountain areas maintaining their clear lead in crimes against property.

Age distribution of offenders showed the greatest concentration between 21 and 25 years; but of the 185,406 persons arrested in 1950 for property crimes, 28.9% were under 21 years of age.

During the first half of 1951, males who were fingerprinted totalled 377,507, representing a 3.6% increase over the corresponding period of 1950. Females were arrested and fingerprinted in much smaller numbers—only 41,944—but this was still an impressive increase of 10.8% over 1950 levels. Of the males arrested, 62.1% had been fingerprinted before, with 46.0% of the females also showing earlier criminal records.

Racial distributions included 302,744 whites, 110,309 Negroes, 4,188 Indians, 424 Chinese, 137 Japanese and 1,649 of other races.

Crime Investigations.—The United States senate's special

ESTES KEFAUVER (centre foreground) listening to testimony by Mrs. Virginia Hill Hauser (right) during televised hearings before the senate crime investigating committee held in New York city in March 1951

committee to investigate organized crime in interstate commerce (Kefauver committee) was widely publicized in 1950 when its public open hearings were held in various large United States cities. But 1951 witnessed the extraordinary response of the United States public to the televised broadcasts of the hearings held in New York city. Gamblers and political fixers both in and out of public office gave their testimony while millions of their fellow citizens followed the drama with an amused tolerance that quickly changed to bitter revulsion and mounting anger. Hoodlums and political quacks lost their poise in the unseen presence of the television audience and wilted under the heat and glare of studio lighting and the interrogations of committee members and counsel. High points were the reluctant testimony of Frank Costello of New York and Willie Minetti of New Jersey, while William O'Dwyer, former mayor of New York city, was recalled from the U.S. embassy in Mexico City, Mex., to face a fusillade of questioning.

Aside from the clear and open demonstration of the vicious alliances prevailing among gamblers and public officers in large cities, it was uncertain whether the senate committee's hearings would have any large or continuing results. Ambassador O'Dwyer returned to Mexico, Willie Minetti was assassinated for talking too freely at the New York hearings and Costello was indicted for perjury and removed himself at least temporarily from the public eye. A flurry of citations for judicial contempt descended upon some of the major and minor characters. As the year closed these proceedings were confused by the usual dilatory manoeuvres. But that part of the public that pours hundreds of millions of dollars into the pockets of touts and bookmakers had improved the opportunity to gaze upon the men who make indulgence in gambling possible, and the general reaction was clearly unfavourable.

Whether rightly or wrongly, numerous political overturns in Nov. 1951 were attributed to such popular resentment, while reliable evidence abounded on every hand that sports betting together with most other forms of organized gambling had suffered a severe though probably temporary decline.

The investigations of District Attorney Frank Hogan of New York county (Manhattan), N.Y., disclosed such widespread corruption of basketball players appearing in the commercialized setting of Madison Square Garden in New York city as to emphasize the long-established principle that amateur gamblers are willing to assume large risks with their money, but that professional gamblers try to eliminate all elements of chance in their own underwritings. (*See* also DEMOCRATIC PARTY; FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; LAW; MUNICIPAL GOVERNMENT; POLICE; SECRET SERVICE, U.S.)

BIBLIOGRAPHY.—Federal Bureau of Investigation, *Uniform Crime Reports for the United States and Its Possessions* (semiannual bulletin for 1950 and the first half of 1951); *Hearings* and *Reports* of the Senate Special Committee to Investigate Organized Crime in Interstate Commerce (1951). (BR. S.)

Great Britain.—In 1950 the number of persons in England and Wales found guilty of offenses of all kinds was 688,650, of whom 116,021 had committed indictable offenses, 564,844 nonindictable offenses and 7,785 offenses against the defense regulations, an increase of 1,727 and 41,281 and a decline of 4,855, respectively, against the figures for 1949.

Among the indictable offenses which contributed to the increase were violence against the person (16%), sexual offenses (5%), thefts of motor vehicles (32%) and thefts from automatic machines and meters (26%). The number of murderers of persons aged one year and over rose from 95 to 109, the total number of victims from 114 to 122. Seventy-one persons were arrested in murder cases involving 72 victims. Four of those arrested were discharged, 14 found unfit to plead, 15 found guilty but insane, 2 certified insane after conviction and 9 acquitted; 14 were executed and the rest sent to prison or other institutions. Thirty-eight murderers or suspects committed suicide before arrest.

The number of persons found guilty of traffic offenses, accounting for 63% of all nonindictable offenses, increased from 320,182 to 357,932, and the fines paid by motorists from £392,905 to £492,038. Of those found guilty of indictable offenses, 100,948 were males and 15,073 females; 23% were under 14 years old, 14% between 14 and 17, 11% between 17 and 21, 21% between 21 and 30 and 31% were 30 and over.

Indictable offenses known to the police increased from 459,869 in 1949 to 461,435 in 1950. The percentage of indictable offenses cleared up remained 47.

In the metropolitan police district the number of indictable offenses known to the police showed a decline from 106,077 in

1949 to 100,304 in 1950; *i.e.,* 12.6 against 11.9 per 1,000 inhabitants. This decline was confined to persons under 14 and between 21 and 40; for the age group 17–20 there was an increase of 9.1%. However, offenses against the person, including sexual offenses, increased by 7.1%. Robbery and assault with intent to rob declined by 11.7% from 290 to 256 cases. The percentage of indictable offenses cleared up was 32.4 against 31.3 in 1949. Of the 26,862 persons arrested for such offenses, 39% had previous criminal records.

In Scotland, the number of persons against whom a crime or an offense was proved was 96,271 in 1950 as against 92,778 in 1949, an increase of 3.8%. Of these, 91.7% were males, as compared with 90.9% in 1949. The highest incidence was again in the 17–20 age group for males and in the 30–39 group for females. The total number of crimes and offenses known to the police was 173,708, an increase of 11,210 or 6.9% against 1949. The number of crimes in the 4 counties of cities was 22.5 per 1,000, compared with 13.0 in the 10 large burghs with separate police forces and 8.8 in the 19 county or joint police areas. Twenty-one cases of murder were known to the police compared with 14 in 1949; of the 16 persons prosecuted 4 were acquitted or had the charge against them withdrawn and 3 were found insane and unfit for trial. Of the nine persons sentenced to death seven were reprieved.

Europe.—In Austria, a slight fall occurred in 1950 in the number of cases known to the police; *i.e.,* from 221,097 to 211,783. Murder and manslaughter declined from 155 to 101, but sexual offenses showed a further increase from 2,691 to 2,821. Altogether, the trends of crime reflected the greater stability of conditions in Austria: robberies, which had amounted to 1,732 in 1947 and 597 in 1949, went down to 350 in 1950 and burglaries declined from 14,756 in 1947 and 6,555 in 1949 to 5,163.

In France, there was a further slight fall in the total number of cases dealt with, from 670,962 in 1949 to 658,047 in 1950, and the percentage of arrests declined from 58 to 48. An increase occurred in crimes against persons from 23,550 to 26,626, whereas sexual crimes declined from 15,908 to 14,652 and thefts from 233,816 to 187,496. Crude Oil: *see* Petroleum.

Cuba. The republic of Cuba occupies all of the island which lies between 20° and 25° N. lat. and 74° and 85° W. long. Including various small islands under Cuban sovereignty, its area is 44,217 sq.mi. The population in 1951 was estimated at 5,400,000, approximately half of non-European origin. Greater Havana had a population in excess of 800,000 (est. 1949); other important cities (est. 1946) were Santiago de Cuba, 152,000; Camagüey, 87,000; Pinar del Río, 64,000; Matanzas, 55,000; Santa Clara, 54,000; Cienfuegos, 53,000. President during 1951: Carlos Prío Socarrás.

History.—Cuba's third largest sugar crop on record was harvested in 1951, attaining a total of 6,348,368 metric tons. The problem of marketing the portion not acquired by the United States continued to absorb the attention of the industry. At the end of 1951, the Cuban quota of sugar imported into the United States was slightly reduced. A study of the economy of Cuba by the International Bank for Reconstruction and Development, published in 1951, stressed the need of vigorous promotion of the export of nonsugar products, in order to reduce the dependence of Cuba on sugar; and also recommended more extensive research on the part of the sugar industry on all aspects of its operations. Among many other recommendations was one of improving the relations between labour and management, through legislation and its effective administration. This report was part of the preparation for consideration by the bank of a substantial loan to Cuba, which had not been granted when the year closed.

The Central bank was able, by the middle of 1951, to substitute Cuban currency for the floating supply of U.S. dollars, which, after July 1, were treated like any other foreign currency. The currency (peso = $1) remained stable in foreign exchange markets, but prices and costs of operation continued to rise. Building activity continued in nearly all the larger communities. The trade balance continued modestly favourable. The treasury's holdings of foreign currency (chiefly dollars) remained high.

The budget was voted late in the year and contemplated expenditure of slightly more than $300,000,000, of which debt service absorbed about $6,500,000. A tax on dividends of 5.8% and one of 4% on corporate surpluses in excess of 30% of capital stock were established to provide a retirement fund for all national government employees. At the end of the year the government indicated its intention to establish a tax of six cents on each 100-lb. bag of sugar to pay for the nationalization of the Havana United railways (owned by British investors), which had a costly strike during the year.

Relations with the Dominican Republic again became tense after the latter seized a Guatemalan ship on the high seas in July, and later condemned to long terms of imprisonment five Cuban members of the crew, on the charge of conspiring against the Dominican regime. At Christmas, the Dominican president freed these Cubans and the tension was relaxed.

The search for oil in the coastal waters of Cuba continued throughout the year, and one well as deep as 10,000 ft. was drilled on the north coast.

Activity in mining was sustained, and improvement in transportation facilities aided industry and agriculture alike.

(C. Me.)

Education.—In the school year 1944–45 there were 498,286 children in attendance at public schools and 72,000 at private schools. There were 21 institutes for advanced education and a normal school and a commercial school in each province. University education was available at the University of Havana, the Oriente university (Santiago de Cuba) and the Catholic University of Villanova (Havana). The 1950–51 budget allocated $15,279,640 for education. In 1951 there were 600 motion-picture theatres.

Finance.—The monetary unit is the peso, officially pegged at par with the U.S. dollar. The budget for the fiscal year 1951–52 estimated ordinary expenditure at $102,300,000, extraordinary expenditure at $197,500,000 and all revenue at $299,800,000. As of Dec. 31, 1949, the national debt was $105,880,000, of which $73,912,700 was foreign and $31,967,300 was domestic. Currency in circulation (June 30, 1951) totalled $846,000,000; demand deposits $523,000,000; gold reserves (Nov. 30, 1951) $501,000,000. The national income in 1950 was estimated at $1,650,000,000. The retail food price index (Havana) stood at 249 in June 1951 (July–Dec. 1937 = 100).

Trade and Communications.—Exports in 1950 totalled $657,000,000; imports were $515,000,000. The chief exports were sugar (85%), tobacco and products (5%) and molasses (4%). Leading customers were the U.S. (59%), the United Kingdom (15%) and the Netherlands (5%). The U.S. (79%) was the leading supplier. Important imports included rice and flour, petroleum and products, cotton and manufactures, and iron and steel and manufactures.

Railways (1949) included 3,017 mi. of main line, 660 mi. of sidings and yards and 7,870 mi. of industrial trackage. Roads (1949) included 1,720 mi. of paved highways and 600 mi. of improved highways. As of Jan. 1, 1951, there were 72,392 passenger cars, 32,377 trucks, 5,307 buses and 1,820 truck trailers. The merchant marine had 34 steamers and motorships (100 tons and over) aggregating 36,135 gross tons on June 30, 1949. In May 1951 there were two television stations and 18,000 television sets.

Agriculture.—Sugar cane continued to be by far the most important crop. Production of sugar in the 1950–51 season amounted to 6,348,660 short tons (1949–50, 6,126,000 tons). Production of blackstrap molasses totalled 288,639,643 gal. Production of other crops in 1950–51 included coffee, 547,000 bags of 132 lb. each; tobacco, 38,000 short tons; henequen fibre, 17,500 tons; rice (paddy), 143,000,000 lb.; black beans, 69,000,000 lb.; red beans, 19,000,000 lb. As of Jan. 1, 1951, there were 4,600,000 cattle; on July 1, 1946, there were 1,338,000 pigs, 154,000 sheep and 141,000 goats.

Manufactures.—The manufacture of sugar from sugar cane continued to be the principal industry. There were in 1951 about 160 sugar mills scattered throughout the island. In 1950, 350,000 short tons of cement and 75,700,000 kw.hr. of electric energy were produced.

Curling. Canadian teams monopolized the major prizes in the sport during 1951, capping the season when dominion stars regained the Gordon international medal by defeating the United States players, 413 to 366, in a two-day bonspiel at Montreal in March. One of the most popular events on the calendar was the annual meet of the Utica (N.Y.) Curling club that extended over four days, where Canadians again triumphed. Kingston, Ont., skipped by Joseph Shamess, won the Mitchell medal and Lachine, Que., led by Gordon Cape, took the Allen medal. Teams from Canada also carried home the Country Club cup and the Dewar trophy.

The 16th annual bonspiel of the St. Andrews Golf club at Hastings-on-Hudson, N.Y., in January drew a big field. The St. George club of Montreal captured the Douglas medal and the Hamilton (Ont.) Thistles, victorious in the event for three successive years, won the Griffiths award in the consolation final.

Nova Scotia annexed dominion laurels for the first time when the Kentville rink, skipped by Don Oyler, won ten straight matches without a defeat in the playdowns.

A Poynette, Wis., rink won the Midwest Curling association's annual bonspiel. The Gordon Grand National medal, eastern states' top prize, went for the second straight year to a Utica Curling club rink. The United States Women's Curling association's third annual bonspiel was won by a Wauwatosa, Wis., rink. The Chicago Curling club Heathers' international bonspiel honours also went to a Wauwatosa team.

Cycling. Gus Gatto of San Jose, Calif., rode off with the senior open title in the championships sponsored in 1951 by the Amateur Bicycle League of America. Gatto, with the aid of a triumph in the one-mile sprint, scored 14 points in the two-day competition held at Columbus, O., Aug. 4–5. Ernie Seubert of Ridgewood, N.Y., who captured the five-mile event, finished only one tally behind the new champion, who won two sprints and placed fifth in another. Joe Cirone of Alhambra, Calif., finished third with 12 points. Anna Piplak of Chicago, Ill., took the women's laurels with a score of 19 after gaining the lead on opening day with a victory in the one-mile event and a second place in the half-mile sprint. Vaughn Angell of Salt Lake City, Utah, took home the junior crown.

François Mertens retained his senior title in the New York state amateur meet at Flushing, N.Y., June 24 when he tallied 19 points to defeat Seubert, who was credited with 15. Lorraine Thomas again won in the women's division with 21 markers, and William Nickonovitz led the juniors.

The national amateur senior championship for banked tracks was annexed by Dave Rhoades of Long Branch, Calif.

Mertens added to his prizes with a triumph over 96 other cyclists in the eighth running of the 50-mi. tour of Somerville, N.J., the country's longest race for amateur riders, on May 30.

Cyprus. An island in the eastern Mediterranean, Cyprus is a British colony. Area: 3,572 sq.mi. Pop.: (1946 census) 450,114; (1950 est.) 484,000. Language: Greek 80.3%, Turkish 17.8%; English is spoken by about 10%. Religion: Greek Orthodox 80.4%, Moslem 17.9%. Chief towns: Nicosia (cap., 34,463); Larnaca (14,746); Limassol (22,693); Famagusta (15,912). Governor in 1951: Sir Andrew Wright.

History.—So far as the *enosis* movement for union with Greece was concerned 1951 was a good deal quieter than the previous year. The efforts of both the right and left wings of the movement to enlist foreign support in Europe and at the U.N. had met with little success. The antisedition law was made more specific, and in March the editor of a Communist newspaper and five others went to prison for taking part in a demonstration against the measure.

Prosperity and development continued. A new law established selected villages as "improvement areas" and set up local councils as a step toward a more fully developed rural local government; a forestry school was opened in September with students attending not only from Cyprus but also from North Africa, the middle east and Kenya; and a new power station at Dekhelia was due to start operating early in 1952. The British garrison was larger than ever before, being more than 10,000 strong, and in October an entire parachute brigade was transported from Cyprus to the Suez canal zone by air. Income tax rates were reduced.

Education.—Primary school attendance (1949) 60,000. Other schools: secondary 42, agricultural 2, trade 1, teachers' training colleges 2.

Finance and Trade.—Currency: piastre (180 piastres = £1 = $2.80 U.S.). Budget (1951 est.): revenue £4,800,000; expenditure £4,700,000. Foreign trade (1950): imports £13,500,000; exports £11,000,000. Main products: citrus, seeds, vine products, carob, wool and copper. (K. G. B.)

Cyrenaica: *see* LIBYA.

Czechoslovakia. A people's republic of central Europe, Czechoslovakia is bounded W. and N.W. by Germany, N. and N.E. by Poland, E. by the U.S.S.R., S. by Hungary and Austria. Area: 49,330 sq.mi. Pop.: (Feb., 1950, est.) 12,596,000. Language: Czech and Slovak. Religion: mainly Roman Catholic. Chief towns (pop., 1947 census): Prague (cap., 921,416); Brno (272,760); Moravska Ostrava (181,181); Bratislava (172,664); Plzeň (118,152). President of the republic in 1951: Klement Gottwald; prime minister, Antonín Zápotocký.

History.—In Feb. 1951 the government announced a large increase in the production targets of the current five-year plan. Under the revised plan the yearly increase in industrial output was to be 22% instead of the originally planned 16%. The targets for coal production exceeded the original targets by 20%, of chemicals by 30% and of heavy engineering by 48%. The output of heavy industry as a whole in 1953 was to be 230% of the 1948 level instead of 170%.

Problems of manpower and management continued to worry the government throughout the year. During 1950 the number of women in industry had increased by 135,000 and during 1951 pressure continued to recruit women workers. Serious attempts were made to diminish the number of clerical workers and to transfer men and women from office jobs to direct production. By the end of October 72,000 persons had been so transferred. There was still an acute shortage of coal miners. On Oct. 17 a statement was made by the Communist party that in the important Moravska Ostrava coal basin the plan had been systematically underfulfilled. Both workers and management were to blame. A large part of the labour force stayed in the mines only for a short period. The standards of output ("norms") on which wages were based were too low. Existing machinery was inadequately and wastefully used. The local branches of the Communist party had failed in their duty of creating toiling enthusiasm by political enlightenment. The party decided radically to reorganize the managing personnel, to raise norms and to introduce a new wage system providing greater incentives. During the year Zápotocký continued, as in earlier years, to urge the workers to greater efforts and to deplore their slackness. On Nov. 9 the premier, himself a veteran trade unionist, told the Trade Union council that demands from the workers for more equal wages must be resolutely resisted. The government had already gone dangerously far in raising the wages of the lower-paid and unskilled categories of workers. On Nov. 13 the government announced an increase by 15% of the norms in the steel industry and the introduction of a new system of progressive piece rates.

Government spokesmen often stressed the need to speed up the collectivization of agriculture. Zápotocký in October stated that supply difficulties in the towns were the result of the fact that the workers' demand for meat had risen in comparison with the prewar period. Higher agricultural output, the premier declared, would come only when agriculture was socialized. The faster the peasants were persuaded to join collective farms, the sooner the supply problem would be solved. According to a statement in the assembly in November, there were then more than 7,000 "agricultural co-operatives" or preparatory committees for the formation of such, and these together held nearly 27% of the arable land in Czechoslovakia.

In September a reorganization of the machinery of government was announced. The ministry of heavy industry was subdivided into five separate ministries—fuel and power, foundries and ore mines, chemicals, heavy engineering and general engineering. A new ministry of forests and timber industry was created. The old ministry of labour and social welfare was transformed into a ministry of manpower, and its welfare functions distributed between the other departments. A ministry of state control was introduced, based on the institution of the same name in the Soviet Union. Its task was to watch the administration generally, to check up on the efficiency, honesty and political orthodoxy of officials and to encourage and act upon complaints and denunciations by citizens.

The government reorganization was accompanied by the abolition of the post of general secretary of the Communist party and the transfer of its hitherto powerful holder, Rudolf Slánský, to a vice premiership without clearly defined functions. Two months later it was announced that Slánský had been arrested for treasonable activities. After his fall, Slánský was indiscriminately associated in official propaganda with the previously disgraced Communists and the western "warmongers."

Czechoslovakia's foreign policy continued faithfully to follow the Soviet lead. Spy trials included alleged French agents in Bratislava in mid-June and the U.S. newspaper correspondent William Oatis in July. In October Wilhelm Pieck, president of the Eastern German republic, paid an official visit to Prague. He publicly declared the transfer of the Sudeten German population to Germany an "irrevocable, just and final solution." (H. S-W.)

Education.—Schools (1948): elementary 12,019, pupils 1,059,010; higher grade 2,280, pupils 463,295; secondary 292, pupils 70,440; vocational 1,243, pupils 91,160; universities 7, students 31,769; institutions of higher education 10, students 23,127.

Finance and Banking.—Budget: (1950 est.) revenue 131,930,000,000 koruny, expenditure 131,556,000,000 koruny; (1951 est.) revenue 166,520,000,000 koruny, expenditure 166,100,000,000 koruny. Currency circulation (March 1950): 72,000,000,000 koruny; bank deposits (Jan. 1950): 146,000,000,000 koruny. Monetary unit: koruna, with an official exchange rate of 50.00 koruny to the U.S. dollar.

Foreign Trade.—(1949) Imports 39,399,000,000 koruny; exports 40,308,000,000 koruny.

Transport and Communications.—Roads (Dec. 1946): 43,969 mi. Licensed motor vehicles (Dec. 1950): cars 165,000, commercial 65,000. Railways: (1947) 8,161 miles; passenger-miles (six months, 1949) 5,502,000,000; freight ton-miles (six months, 1949) 4,401,000,000. Air transport (1949): flights 16,833; miles flown 4,884,000; freight ton-miles 2,598,000. Telephones (1949) 350,708. Radio receiving set licences (1949): 2,280,017.

Agriculture.—Main crops (metric tons, 1950): wheat 1,590,000; barley 1,225,000; oats 1,080,000; rye 1,170,000; maize (1949) 231,000; potatoes 7,480,000; sugar, raw value 880,000. Livestock: cattle (Jan. 1951) 4,100,000; sheep (Jan. 1950) 480,000; pigs (Jan. 1951) 3,700,000;

horses (Jan. 1950) 640,000; goats (Jan. 1949) 982,000; poultry (Jan. 1949) 15,131,000. Food production (metric tons, 1949): butter 30,000; milk 2,618,000; factory cheese 13,900; meat 290,000, of which beef 104,000.

Industry.—Persons employed in manufacturing industries (Nov. 1949) 1,477,700. Fuel and power (1950): coal 18,500,000 metric tons; lignite 27,500,000 metric tons; manufactured gas (1949) 2,189,000,000 cu.m.; electricity 9,120,000,000 kw.hr. Raw materials (metric tons, 1950): pig iron 1,800,000; steel ingots and castings 2,900,000. Manufactured goods (1949): cotton piece goods 318,000,000 metres; cotton yarn 75,800 metric tons; wool yarn 35,400 metric tons; rayon filament yarn 5,500 metric tons; rayon staple fibre 20,500 metric tons; sheet glass 135,500 metric tons; cement 1,740,000 metric tons. New dwelling units completed (1950) 13,000. Production of motor vehicles (1948) 25,200. Index of industrial production (on basis of 1937 = 100, 1950) 147.

Dairy Industry, Bureau of: *see* AGRICULTURAL RESEARCH ADMINISTRATION.

Dairy Products.

During 1951, the dairy industry in the United States was estimated to have contributed a volume of production 17% more than the pre-World War II level, but about 1% less than in 1950. Milk production was just under 120,000,000,000 lb. It was expected, barring drought, to continue on about the same level in 1952.

Partly as a result of the unusually excellent pasture situation during the midseason and early autumn, the rate of milk production per cow in 1951 approximately equalled or slightly exceeded the 1950 record of 5,292 lb. The number of milk cows at the end of 1951 was expected to approximate the 22,660,000 on farms at the beginning of the year, a slight decline compared with the more than 22,700,000 in the two preceding years and 12% less than the peak number of the middle 1940s.

Particularly at a time when demand for all dairy products, except butter, was relatively strong, this apparent stability of the dairy industry at a level only about 17% above prewar was the cause of some concern, since all livestock products were 43% and all agricultural production was 41% above prewar levels. Costs of production were expected to be somewhat higher in 1952 and feed supplies somewhat less abundant and more costly. Nevertheless, the official production goals of the U.S. department of agriculture for 1952 emphasized the desirability of maintaining production at least as high as 120,000,000,000 lb.

The market prices of milk and its products in 1951 averaged moderately above the maximum support level of 90% parity. Prices strengthened more than seasonally late in the year; in December the price index for dairy products was 3% higher than a month earlier and 15% higher than a year before. Prices received by producers for milk sold to plants and dealers averaged $5.22 per 100 lb.—68 cents more than in Dec. 1950.

The trend toward use of fresh milk rather than its products continued in 1951. Consumption of fluid milk and cream was about 395 lb. per capita for civilians in 1951, 3% more than in 1950 and 16% above prewar levels, in spite of somewhat higher prices in most urban markets than in 1950.

U.S. cheese per capita consumption in 1951 was estimated at 7.5 lb.—the same as in 1950 but 36% above prewar. Stocks of cheese, which were at record levels in 1950, were much reduced in 1951 and the price moved up about one-sixth. Imports of 56,200,000 lb. of cheese in 1950–51 slightly exceeded exports.

Consumption of evaporated milk in 1950 was steady at about 17 lb. per person, compared with a record high of 18.3 lb. in 1948. Production in 1951 was heavy in anticipation of large military demand; hence stocks at year-end were heavy.

The ice cream per capita consumption in 1951, which depends much on income, was estimated at not less than 40 lb. (net milk-use basis). This was far below the 56 lb. of 1946 and far above the prewar average of 23.7 lb.

Milk Production in Principal Producing Countries

(In millions of pounds)

Country	1950	1949	Average 1934–38
United States	123,381	122,071	105,416
France	34,079	30,671	33,000
United Kingdom	23,103	21,506	18,424
Canada	16,437	16,843	15,789
Australia	12,966	12,968	11,780
Netherlands	12,754	11,610	11,180
Denmark	11,931	10,789	11,684
Sweden	10,798	10,245	10,238
New Zealand	10,403	10,135	10,176

Dry milk consumption increased as more people learned how to use it. Nevertheless, consumption was still small, only 3.4 lb. of nonfat dry milk solids per person in 1951; dry whole milk consumption was about one-half pound per person. Exports of the dry skim were heavy as the Commodity Credit corporation disposed of its large holdings; about 331,100,000 lb. were exported in 1950–51.

Butter production declined further in 1951; and though it still exceeded margarine in total use, the gap was narrowing rapidly. Butter production and consumption declined from 1,666,000,000 lb. or 10.8 lb. per person in 1950, to 1,500,000,000 lb. and only 9.7 lb. per person in 1951; margarine meanwhile increased from 937,000,000 lb. (6.1 lb. per person) in 1950 to perhaps 1,050,000,000 lb., or 6.7 lb. per person in 1951. Stocks of butter were sharply reduced after the latter half of 1950 and further decline in consumption was anticipated.

In August import quotas were put on cheese and casein under the provisions of the Defense Production act, as amended, which required the imposition of import controls on certain commodities if their unrestricted importation would impair or reduce domestic production, interfere with orderly domestic storing and marketing or result in an unnecessary burden or expenditure under a government price support program. Under the act, imports of butter, butter oil and nonfat dry milk solids were prohibited.

Milk production in practically every major producing country was increasing. Despite generally increased fluid milk consumption and an increase in processed milk, butter and cheese production also increased. Butter output, excluding ghee, was estimated at 5,590,000,000 lb. in the major producing countries in 1950, 220,000,000 lb. more than in the previous year. Ghee production in addition was approximately 2,400,000,000 lb. Cheese production in 1950 appeared to be about 7% more than in 1949 and 30% above the prewar level. (J. K. R.)

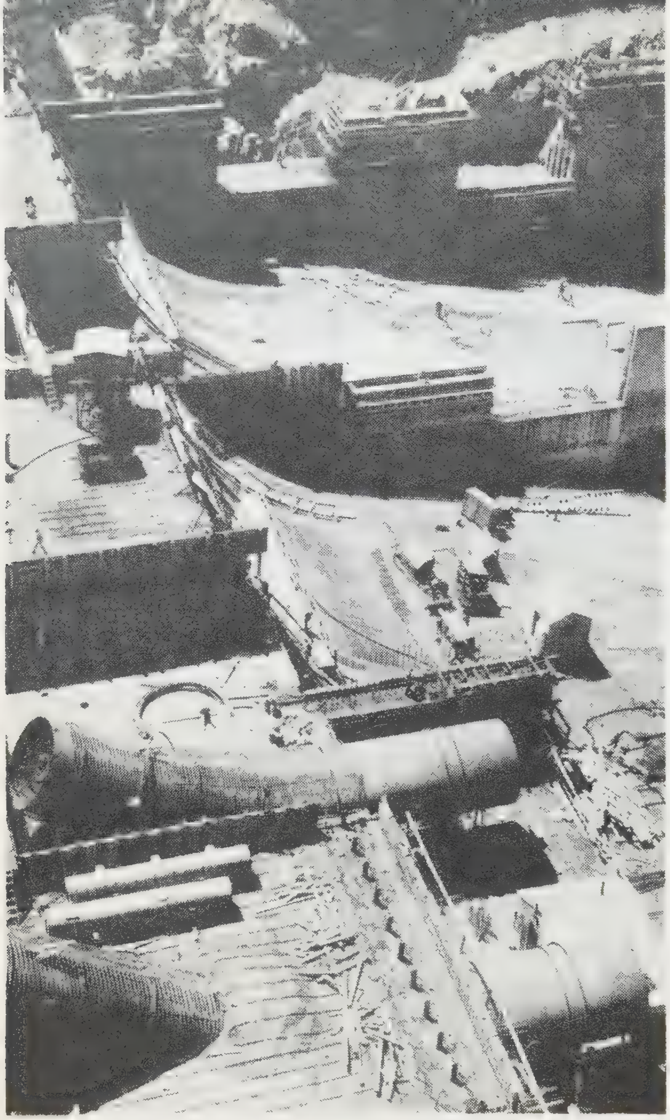
Dakar: *see* FRENCH WEST AFRICA.

Dams.

Emphasis on the development of water resources by governments throughout the world continued to expand dam construction during 1951.

Activity in the United States was highlighted by progress on the tremendous multipurpose dams in the Columbia and Missouri river basins. At Hungry Horse dam, the world's fourth largest concrete dam, construction was proceeding ahead of schedule. The 2,000,000th yard of concrete was placed on Aug. 29, 1951, with the dam at more than two-thirds of its ultimate height, and by early October storage of water had commenced. On the main stem of the Columbia river, high water in January stopped construction of the cofferdam and practically all other work at Chief Joseph dam, but by the end of 1951 concrete was being placed at a rate of more than 3,000 cu.yd. per day. Downstream, at McNary dam, construction was also delayed by flooding and damaging of the cofferdam.

Garrison and Fort Randall dams, on the Missouri river, were 50% complete in 1951. Construction of the 35-ft.-diameter bore of the power tunnels at Garrison dam proceeded at a rate of 24 ft. per day. Downstream, at Oahe dam, more than 2,200,000 cu.yd. of fill was completed in 1951, and placing was continuing at a rate of 30,000 cu.yd. per day.



AIR VIEW of the all-concrete Canyon Ferry dam under construction in 1951 on the Missouri river 18 mi. E. of Helena, Mont.

Construction of dams in Europe was highlighted by the efforts in France to replace and supplement the power-generating facilities destroyed during World War II. On the Dordogne river, work was under way in 1951 on Bort-les-Orgues and Chastang concrete arch gravity dams, 394 ft. and 280 ft. high, respectively. The former would contain 900,000 cu.yd. of concrete and would be the largest in France. A unique method of construction of the dam was the use of precast concrete panel sections as forms for the concrete, to be left in place as the permanent facing of the dam. Both dams would have unique spillways discharging into mid-air over the roof of the powerhouse, known as the *saut de ski* or ski-jump type. Dispersion of the water as it mixes with the air destroys some of the energy of the falling water and reduces the erosion of the stream bed.

At Tignes dam, on the Isère river, 600,000 cu.yd. of concrete were in place at the end of 1951. A concrete arch dam, being built by Electricité de France, it would, when completed, be Europe's highest dam, 592 ft. high.

In Turkey, at the 360-ft.-high Sariyar dam on the Sakarya river, construction of access roads was completed during 1951, and work was under way on the cofferdams and the diversion and power tunnel.

An extensive program in India for development of irrigation and hydroelectric power was further aided in 1951 by a third loan from the International Bank for Reconstruction and Development for work on dams under construction in the Damodar river valley in Bihar. This included the Konar dam on the Konar river, a 160-ft.-high earthfill dam 12,600 ft. long, and the Tiluiya dam on the Baraker river, a 112-ft.-high, 1,150-ft.-long concrete gravity dam. On the Mâhanadi river in Orissa, construction was under way in 1951 on the Hirakud dam, a 180-ft.-high earthfill and concrete gravity dam. In addition to the 11,000-ft.-long earthfill and 4,700-ft.-long concrete sections, approximately 17 mi. of earth dikes would be required to contain the 6,000,000-ac.-ft. reservoir. At Tungabhadra dam, on a tributary of the Kistna river, 25% of the 1,900,000 cu.yd. of stone masonry for the 130-ft.-high, 6,000-ft.-long dam was complete in 1951, with construction proceeding at the rate of 1,000 cu.yd. per day.

The accompanying table lists 15 of the important dams of the world under construction during 1951. (*See* also AQUEDUCTS; IRRIGATION; TENNESSEE VALLEY AUTHORITY.) (B. O. M.)

Dance.

Ballet.—The year 1951 was marked by enormous productivity in the dance field. Ballet companies concentrated on the creation of new works rather than on extensive touring. Nevertheless there was a healthy exchange of artists between countries.

United States.—The New York City Ballet made its Chicago debut and danced for 15 weeks in New York, presenting nine new ballets. George Balanchine choreographed *La Valse, Capriccio brillant, Tyl Ulenspiegel* and *À la Françaix,* with music by Maurice Ravel, Felix Mendelssohn, Richard Strauss and Jean Françaix, respectively. *Lady of the Camellias* had choreography by Antony Tudor and music by Giuseppe Verdi. Jerome Robbins choreographed *The Cage* and *The Pied Piper,* with music by Igor Stravinsky and Aaron Copland. *The Miraculous Mandarin* had music by Béla Bartók and choreography by Todd Bolender, and *Cakewalk* had music by Louis Moreau Gottshalk and choreography by Ruthanna Boris. A new version of Peter Tschaikovsky's *Swan Lake* was arranged by Balanchine, whose *Pas de trois*

and *Apollo* were also given. *The Card Party, The Fairy's Kiss, Concerto barocco* and *The Four Temperaments* were revived. Tudor restaged his *Lilac Garden* for this company, and danced in it. Nora Kaye and André Eglevsky joined the company, which was headed by Maria Tallchief, Tanaquil LeClerq, Janet Reed, Melissa Hayden, Patricia Wilde, Diana Adams, Herbert Bliss, Francisco Moncion, Hugh Laing and Nicolas Magallanes.

Ballet Theatre toured the United States and South America, and danced for six weeks at the Metropolitan Opera house, New York city. Jean Babilée and Nathalie Philippart made American debuts as guest artists, dancing *Le Jeune homme et la mort* and *L'Amour et son amour*. The company produced *The Thief Who Loved a Ghost,* choreography by Herbert Ross, music by Carl Maria von Weber; *Ensayos sinfonicos,* choreography by Alicia Alonso, music by Johannes Brahms; *Tropical Pas de Deux,* choreography by Enrique Martinez, music by Amadeo Roldan; and *Schumann Concerto,* choreography by Bronislava Nijinska, music by Robert Schumann. Roland Petit's *Les Demoiselles de la nuit* and Babilée's *Till Eulenspiegel* were given for the first time in America. *Princess Aurora* and *Bluebeard* were revived. Principal dancers were Alonso, Igor Youskevitch, Mary Ellen Moylan and John Kriza. Guest artists included Agnes de Mille, Colette Marchand and Carmelita Maracci, who danced in her own work, *Circo de Espana*. Nora Kaye left Ballet Theatre after 11 years with this company; Erik Bruhn rejoined it. Ballet Theatre opened its own school in New York.

Ballet Russe de Monte Carlo toured the United States. Alexandra Danilova and Frederic Franklin made limited appearances, while leading dancers were Yvonne Chouteau, Nina Novak, Gertrude Tyven, Oleg Tupine and Roman Jasinsky. Guest artists included Mia Slavenska and (in Chicago only) Léonide Massine, who revived his *Capriccio espagnol*. Lupe Serrano and Victor Moreno joined the company.

Zachary Solov was appointed ballet director at the Metropolitan Opera, with Janet Collins (first Negro artist to be engaged by the Metropolitan) and Maria Karnilova as *premières danseuses*. Choreographers for the New York City Opera were Charles Weidman, Sophie Maslow and Grant Mouradoff.

José Greco and his Spanish Ballet enjoyed a long season in New York, where concert appearances were made by Ruth St. Denis, Ted Shawn, Uday Shankar, Merce Cunningham, Jean Erdman, Leticia Jay, Eleanor King, Sybil Shearer and others. Experimental groups active in New York included Theatre Dance, New York Ballet club and Choreographer's workshop, which also appeared in Bermuda.

The Jacob's Pillow Dance festival, directed by Ted Shawn, presented two new ballets by Tudor, *Les Mains gauches* and *Ronde de printemps,* and revived his *Dark Elegies*. Other new works included *The Song of Songs,* choreographed by Shawn, *Along Appointed Sands,* choreographed by Myra Kinch, and ballets by Kate Forbes, Marc Hertsens and Tilda Morse. Soloists at the festival included Diana Adams, Ronne Aul, Herbert Bliss, Jean Leon Destiné, Grace and Kurt Graff, Melissa Hayden, Nora Kaye, Iva Kitchell, Hugh Laing, José Limòn, Annabelle Lyon, La Meri, Lillian Moore, Ted Shawn, Ruth St. Denis and Maria Tallchief.

The American Dance festival at Connecticut college, New London, produced new works by William Bales, Doris Humphrey, Pauline Koner, Limòn, Maslow and Weidman. Martha Graham lectured and taught. The Louisville Philharmonic Symphony commissioned a new solo work, *Joan of Arc,* by Graham, with music by Norman Dello Joio. A new department of dance, directed by Martha Hill, was established at Juilliard School of Music, New York.

Harold Lang, Janet Collins and Jerome Robbins received Donaldson awards for dancing and choreography in musical comedy, while the Antoinette Perry award went to Michael Kidd, and the Capezio award to Zachary Solov.

RECITAL by members of the dance group of Karamu House, a Negro art centre in Cleveland, O.

In October Sadler's Wells Theatre Ballet began its first American tour. Ana Maria, Iva Kitchell, Lillian Moore, Marina Svetlova and Slavenska's Ballet Variant made extensive tours.

In Chicago, the Page-Stone-Camryn Ballet produced *Revenge,* with choreography by Ruth Page and music by Verdi. New works by Walter Camryn were *Thunder in the Hills* and *Alice in Wonderland,* while Bentley Stone choreographed *Les Enfants perdus*. The Chicago Ballet guild produced works by Charles Bockman and Etta Buro.

The San Francisco Ballet produced *Le Gourmand,* choreographed by Lew Christensen, and *Les Maîtresses de Lord Byron,* choreographed by William Christensen. In Los Angeles, Lester Horton reopened his Dance theatre. The Concert Ballet was organized by Lasar Galpern. Michel Panaieff's Ballet Intime toured the Pacific northwest. Roland Petit's Ballets de Paris disbanded in Hollywood. Experimental groups were active throughout the country.

England.—The Festival of Britain was marked by intensive activity in ballet. In January the Sadler's Wells Ballet returned to London after completing its second American tour. Two new works choreographed by Frederick Ashton were produced, *Daphnis and Chloe,* with Maurice Ravel's music, and *Tiresias,* music by Constant Lambert. Massine choreographed *Donald of the Burthens,* with music by Ian Whyte. Leading dancers were Margot Fonteyn (inactive for several months, because of a strained foot), Moira Shearer, Beryl Grey, Violetta Elvin, Michael Somes, Alexis Rassine and Alexander Grant. Nadia Nerina was promoted to the rank of ballerina. Fonteyn was awarded the title of Commander of the British Empire. Ninette de Valois, director of the company, lectured in Yugoslavia, Greece and Turkey.

The Sadler's Wells Theatre Ballet produced two ballets by John Cranko, *Pineapple Poll,* with music by Sir Arthur Sullivan, and *Harlequin in April,* music by Richard Arnell. De Valois' *The Prospect before Us* was revived, and there were new productions of *Coppélia* and *The Nutcracker*. Headed by Elaine Fifield, Svetlana Beriosova, David Blair, Patricia Miller and Maryon Lane, the company began its first U.S. tour.

Ballet Rambert celebrated its 25th anniversary, producing two new works by David Paltenghi, *Canterbury Prologue* and *Fate's Revenge.*

Festival Ballet, headed by Alicia Markova and Anton Dolin, appeared in London and Monte Carlo, and toured England. *Impressions,* choreographed by David Lichine to music by Georges Bizet, was presented. Guest artists included Danilova, Slavenska and Tatiana Riabouchinska.

Mona Inglesby, director of International Ballet, returned to the stage after a long illness. *For Love or Money,* a new work by Harcourt Algeranoff, was presented, and Massine staged his *Capriccio espagnol.*

Ballet workshop was founded in London by Angela and David Ellis, and presented experimental works by many young choreographers.

The Original Ballet Russe, reorganized after the death of its founder, Col. Wassily de Basil, on July 27, toured England. The Marquis de Cuevas' Grand Ballet, the Ballet des Champs Elysées, the Ny Norsk Ballet and the Swedish Ballet appeared in London, as well as Paul Draper, Angna Enters, José Greco, Pilar Lopez, Pearl Primus and Rosario and Antonio. The Ambassador Ballet toured England and Ireland. The Yugoslav National Ballet danced at the Edinburgh festival.

Cyril W. Beaumont and Arnold Haskell received the French Legion of Honour, in recognition of their services to ballet.

France.—The Paris Opera Ballet produced two new works choreographed by its director, Serge Lifar: *L'Astrologue,* with music by Henri Barraud, and *Snow White,* which had music by Maurice Yvain and a cast headed by Liane Daydé, Nina Vyroubova, Jean-Paul Andreani and Lifar. *Schéhérazade* was revived, with Alexander Kalioujny. Tamara Toumanova appeared as guest artist, dancing *Giselle, Swan Lake* and *Phèdre.*

At the Opéra Comique, Massine revived *The Good Humored Ladies,* and produced *Le Bal du Pont Nord.* Jean-Jacques Etcheverry choreographed *Le Chanson du mal aimé* and *Commedia dell'arte.*

The Marquis de Cuevas' Grand Ballet danced in Paris and London, and toured France. Massine choreographed *Symphonie allégorique,* with music by Henri Sauguet. George Skibine arranged *Annabel Lee* and *The Prisoner of the Caucasus.* Two *pas de deux, Tarasiana* and *Raymonda's Dream,* were added to the repertoire. Rosella Hightower choreographed *Scaramouche.* Hightower, Skibine, Marjorie Tallchief, George Zoritch and George Golovine were principal dancers.

The Ballet des Champs Elysées was reorganized and presented Ruth Page's *Impromptu au bois,* with music by Jacques Ibert, and her *Revenge,* with settings by Antoni Clavé. Other new works were *Romanza romana,* with choreography by Frank Staff, music by Pierre Petit, and *La Damnée,* choreography by Walter Gore, music by Samuel Barber. Jacqueline Moreau, Paula Hinton, Sonia Arova and Leon Danielian were among the dancers appearing with this company in Paris, London and Africa.

Janine Charrat organized her own company. Her dance-drama *Abraham* was produced at the Toulouse festival. Among dancers touring Europe were Talley Beatty, Ram Gopal, Juana, Hima Besarcodi, Indra Kamadjojo, Mariemma, Teresa and Luisillo, Clotilde and Alexandre Sakharoff and Cilli Wang.

Australia.—The Australian National Ballet, directed by Joyce Graeme, toured Australia and New Zealand, presenting *Swan Lake, Corroboree, Aurora's Wedding* and other works. The Jubilee Ballet, directed by Edouard Borovansky, presented a large repertoire of classic and modern ballets in Sydney, Brisbane, Adelaide and Melbourne. The Ballet guild produced *Coppélia, Apollo* and works by its director, Laurel Martyn.

Austria.—*Homeric Symphony,* with choreography by Erika Hanka and music by Theodor Berger, was produced by the Vienna State Opera Ballet. Grete Wiesenthal resigned as director of dance at the Vienna academy, and was replaced by Toni Birkmayer. Rosalia Chladek presented *American Impressions* and *Rhapsody in Blue.*

Canada.—The Canadian National Ballet was founded in Toronto, with Celia Franca as artistic director and Irene Apine, David Adams, Lois Smith and Jury Gotshalks as principal dancers. It presented ballets by Adams, Franca and Kay Armstrong, as well as classical works.

The Winnipeg Ballet, directed by Gweneth Lloyd, appeared before Princess Elizabeth. Joy Camden joined this company as assistant ballet mistress. New ballets by Gweneth Lloyd and Arnold Spohr were produced.

Belgium.—Seven ballets were presented at the Dance festival held in Antwerp in February. Jacques Milliand replaced Caroly Zsedenyi as choreographer at the Antwerp Opera. Marthe Coeck was choreographer at the Theatre de la Monnaie, Brussels.

Germany.—The reorganized Jooss Ballet made its first appearances in Essen. New works included *Colombinade,* by Kurt Jooss, and *Fantaisie,* by Hans Zuellig. Leading dancers were Ulla Soederbaum, Noelle de Mosa, Rolf Alexander and Zuellig. An exchange of dancers was arranged with the Chilean Ballet, directed by Lola Botka and Ernst Uthoff.

Yvonne Georgi was engaged as director of the opera ballet in Düsseldorf. Angna Enters danced at the Berlin Arts festival.

Italy.—The Florence May Festival Ballet, directed by Aurel Milloss, with Yurek Shabelevsky as assistant, produced *Misteri, Tirsi e Clori* and *Don Giovanni,* with choreography by Milloss, and *Nocturne,* choreographed by Victor Gsovsky. Leading dancers were Babilée and Philippart, Yvette Chauviré, Toumanova, Moreau, Vladimir Skouratoff and Deryk Mendel. Galina Ulanova and Yuri Kondratov, of the Moscow Ballet, danced in concerts during the festival.

At La Scala, Milan, *The Legend of Joseph* was produced with choreography by Margarete Wallman, music by Richard Strauss, and Toumanova and Giulio Perugini in leading roles. Chauviré danced *Giselle.* Boris Romanoff was engaged as choreographer at the Rome Opera. At the Venice festival, Charrat choreographed *Orfeo,* with music by Roberto Lupi.

Mexico.—José Limòn and his company produced several new works at the Palacio de Bellas Artes, Mexico City. These included *The Four Suns,* with music by Carlos Chavez and settings by Miguel Covarrubias; *Dialogues;* and *Tonanzintla.* For the Ballet Mexicano, Limòn created *Antigona* and *Redes,* and Doris Humphrey revived her *Passacaglia.*

Netherlands.—The Ballet of the Low Countries and the Dutch Opera Ballet danced at the Holland festival, while Toumanova, Perugini, Ethery Pagava and others appeared in *Hommage à la danse classique.*

Scandinavia.—In June a ballet festival was given in Copenhagen, Den., by the Royal Danish Ballet, directed by Harald Lander. Leading dancers included Toni Lander, Gerda Karstens, Kirsten Ralov, Inge Sand, Erik Bruhn, Boerge Ralov and Frank Schaufuss. *Desire,* with choreography by Niels Bjoern Larsen and music by George Gershwin, was produced.

Boris Kniaseff and Janine Charrat staged ballets at the Stockholm Royal Opera.

South America.—Tatiana Leskova staged *Giselle, Coppélia* and other ballets in Rio de Janeiro. Nina Verchinina formed a ballet company under the auspices of the University of Cuyo, Mendoza, Arg. Tamara Grigorieva presented her first ballet, *Concerto coreografico,* in Montevideo, Urug. Ballet Theatre, Katherine Dunham, Iva Kitchell and Mrinalini Sarabhai toured South America. Ballet Alicia Alonso toured the Caribbean islands. Kaye and Eglevsky danced *Giselle* in Havana, Cu., with Ballet Alicia Alonso.

U.S.S.R.—Galina Ulanova and Olga Lepeshinskaya were awarded the title People's Artist of the U.S.S.R. in November. (Ln. M.)

Ballroom Dancing.—The major changes in ballroom dancing during 1951 affected the so-called Latin dances. The most noticeable development was the return of the tango. Experts attributed this sudden interest in the tango to various causes: to the motion picture *The Valentino Story,* to the Spanish trend in women's fashions and to the success of the tango hit tunes "I Get Ideas" and "Blue Tango."

Another outgrowth affected the rumba. This dance had already grown to international popularity second only to the ubiquitous fox trot. There was, however, a change in the style of the dance—musical compositions shifted from regular, measured beats to a syncopated form known as mambo. Step patterns to this tempo resemble a combination of rumba and jitterbug. An infinite variety of dance movements are adaptable to mambo and this awakened fresh interest and enthusiasm.

Samba, the Brazilian variation of the waltz, continued to flourish. It is the easiest of all the Latin dances to learn and execute. Further, its waltz-pattern steps appeal to both old and young people.

There were no dance crazes or unusual novelties during the year. The Charleston, a famed and frenzied revival during 1950, died out. The year 1951 was merely an average year for ballroom dancing.

Death Statistics. Despite an outbreak of respiratory disease in the early months of the year, the death rate for the United States during the first nine months of 1951 was only 1% above that for the same period of 1950. There were altogether 1,456,000 deaths during the entire year 1950, and the death rate was 9.6 per 1,000 population. Canada also experienced an increase in mortality from 1950 to 1951, according to data covering the first seven months of both years. The Canadian mortality record for all of 1950 showed 123,649 deaths and a death rate of 8.9 per 1,000 population. Largely as a result of a particularly severe epidemic of respiratory disease in England and Wales during the winter of 1950–51, the urban death record in that country for the first ten months of 1951 was 13% above that for the corresponding period of 1950. For the whole of 1950, England and Wales recorded 510,274 deaths, and a death rate of 11.6 per 1,000 population. In 1950 the European populations of New Zealand and the Union of South Africa had death rates of 9.3 and 9.1 per 1,000 respectively. The 1950 figure for Australia was 9.6 per 1,000. Among the European countries, the Netherlands had a rate in 1950 of only 7.5, Norway 8.9, Sweden 10.0, Switzerland 10.1, Denmark 9.2, Finland 10.1, Italy 9.8 and western Germany 10.4. However, these rates are not strictly comparable since they do not take into account the different proportions of aged persons in these countries.

According to the mortality records of the industrial policyholders of the Metropolitan Life Insurance company for the first ten months of 1951, compared with the same period of 1950, there were decreases in the death rates for tuberculosis, the principal communicable diseases of childhood, syphilis, general arteriosclerosis, acute poliomyelitis, appendicitis, the complications of pregnancy and childbirth, suicide and homicide. There were either slight increases or no changes for diabetes, ulcers of the stomach and duodenum, cirrhosis of the liver and accidents. More marked increases were recorded for pneumonia and influenza, cancer and the cardiovascular-renal diseases.

The death rates for the leading causes per 100,000 population in the United States in 1950 were: diseases of the cardiovascular system, 492.7; malignant neoplasms (principally cancer), 139.6; pneumonia and influenza, 31.1; tuberculosis, 22.2; chronic nephritis, 16.9; diabetes mellitus, 16.6; congenital malformations, 12.2; suicide, 11.4; motor vehicle accidents, 22.2; all other accidents, 37.7. These death rates were provisional, being based on a 10% sample of the death certificates for 1950.

On the basis of mortality records for the general population of the United States in 1949, the latest year for which life tables were constructed as of the close of 1951, the average length of life was: 67.6 years for total persons; 65.9 years for white males; 71.5 years for white females; 58.6 years for nonwhite males; and 62.9 years for nonwhite females. For the total population, the gain since 1948 amounted to one-half year, and since 1939–41 to 4.0 years. England and Wales in 1949 had an average length of life of 66.0 years for males and 70.6 years for females. The corresponding figures for the Netherlands in 1947–49 were: males, 69.4 years; females, 71.5 years.

In order to gauge the room for improvement in longevity by the control of disease and accident, life tables for the United States in 1948 were prepared with certain causes of death eliminated. In this way it was found that the average length of life without the cardiovascular-renal diseases would be increased by 9.8 years for white males and 9.0 years for white females; without cancer, the respective gains were 1.8 and 2.5 years; without accidents, 1.8 and 0.8 years; without tuberculosis, 0.5 and 0.4 years; and without diabetes, 0.2 and 0.5 years. On the same basis, the chances per 1,000 of eventual death for white persons at birth were: cardiovascular-renal diseases—males 558, females 579; cancer (including leukaemia and Hodgkin's disease)—males 137, females 158; pneumonia and influenza—35 for each sex; tuberculosis—males 26, females 13; accidents

—males 69, females 52.

War casualties experienced by the United States forces in Korea from the beginning of hostilities to the report dated Nov. 21, 1951, came to: battle deaths, 16,972; missing, 10,871; wounded, 70,768; prisoners, 174; missing accounted for, 1,391.

It was shown, in a paper by L. I. Dublin before the American Public Health association in San Francisco, Calif., in Oct. 1951, that the advantage the United States has in low mortality in youth and early maturity, when compared with other advanced countries, is lost at the higher ages. In this international comparison the accident record at the older ages was found to be particularly bad for both males and females after 45 years of age. The older white males in the United States also had exceptionally high death rates from the cardiovascular-renal diseases, whereas the record for white females was about the average for the other countries in the comparison. In explanation of the relatively poor showing of the United States at the higher ages, it was suggested that, with the high quality of medical care available, large numbers are brought into midlife with organic impairments resulting from infections in earlier years. In other countries, such persons might have succumbed before midlife. With the probability of a higher proportion of such disabled lives in the United States at the older ages, the mortality rates would thus tend to be high. It was also suggested that this high mortality might reflect the large proportion of obese persons in the United States at the older ages, a consequence of an abundant food supply. (*See* also ACCIDENT PREVENTION; CENSUS DATA, U.S.; DISASTERS; INFANT MORTALITY; SUICIDE STATISTICS.)

BIBLIOGRAPHY.—Louis I. Dublin, *The Facts of Life from Birth to Death* (1951). (M. SP.)

Debt, National.

The national debt of the United States at the end of fiscal year 1951 amounted to $255,222,000,000. (*See* Table I.) In his budget message of Jan. 21, 1952, Pres. Harry S. Truman estimated that, as a reflection of budget deficits calculated in terms of existing revenue legislation, the national debt would be increased to $260,000,000,000 by June 30, 1952, and to the statutory limit of $275,000,000,000 by June 30, 1953.

Table I.—*National Debt of the United States*

June 30	(Millions of dollars)	June 30	(Millions of dollars)
1915	1,191	1944	201,003
1920	24,298	1945	258,682
1925	20,516	1946	269,422
1930	16,185	1947	258,286
1935	28,701	1948	252,292
1940	42,971	1949	252,770
1941	48,961	1950	257,357
1942	72,422	1951	255,222
1943	136,696	1952	260,000

Source: Data from 1915 to 1951 are from U.S. Department of the Treasury, daily treasury statement (revised); 1952 is estimate from President Truman's Jan. 1952 budget message.

The prospective sharp rise in the public debt during fiscal years 1952 and 1953 followed a substantial reduction in debt during the 1946–48 period and an irregular, moderate increase over the 1949–51 period. The public debt as of June 30, 1951, was about $24,000,000,000 below the peak total of $279,214,000,000 reached at the end of Feb. 1946.

The postwar debt-retirement program of the U.S. treasury involved a steady and sizable reduction in marketable interest-bearing securities. From Jan. 1946 through Dec. 1951 the gross reduction in such securities amounted to $57,124,000,000. (*See* Table II.)

Table III furnishes data on the sources of funds for the reduction in the marketable interest-bearing public debt. The funds used to retire aggregate maturities of $23,197,000,000 during the last ten months of 1946 were obtained chiefly from the general fund cash balance accumulated by the Victory Loan drive. In the period 1947–51 funds for reducing the marketable public debt were derived mainly from the growth in nonmarketable issues. This was supplemented by budget surpluses in 1947 and 1948 and partly offset by budget deficits in 1949 and 1951. The portion of the total public debt constituted by marketable interest-bearing obligations declined from 72% in March 1946 to 55% at the end of 1951.

The significance of federal debt management in 1951 can best be viewed against the background of previous management operations. The maintenance of order and stability in the government bond market—a policy initiated in the pre-World War II period—was a primary objective of the debt management program in the war and postwar periods. In line with this objective, the prewar structure of interest rates was maintained with only minor variation during the war, permitting the authorities to finance cheaply the huge requirements of war finance.

In the postwar period the stabilization of the government bond market, a joint treasury-federal reserve function, required different policies to meet changing conditions. Beginning in the spring of 1947, for example, several steps were taken to control an incipient boom in the government bond market. But in 1948, when a downward pressure on government bond prices developed, the federal reserve system supported the market through substantial purchases of government bonds from investment institutions and other nonbank holders seeking to acquire funds for lending. The prices of the longest-term issues were stabilized at slightly above par.

While pursuing the broad policy of stabilizing the market for government securities, treasury and federal reserve authorities adopted numerous measures designed to combat postwar inflation. Among them may be noted: (1) the substantial reduction effected in bank ownership of federal securities; (2) active promotion of the sale of savings bonds; (3) permitting interest rates to rise on short-term government securities from mid-1947 until the fall of 1948; and (4) raising by approximately $3,000,000,000 in 1948 the amount of reserves required to be held by member banks to prevent the additional reserves created by federal reserve support purchases from becoming the basis for multiple credit expansion.

In 1949, with the abatement of inflationary pressures and moderate downturn of business activity, the board of governors of the federal reserve system on three occasions reduced the reserve requirements of member banks in order to make credit more freely available. The strong bank demand stemming from these reductions resulted in sharp increases in the prices of government securities. To maintain orderly conditions in the money markets, the federal reserve sold short-term securities in considerable volume; but it discontinued the practice of freely selling government bonds. This compromise policy moderated the decline in yields on short-term government securities but permitted market forces to depress sharply the yields on medium and long-term government securities, thereby encouraging investors to seek municipal and corporate securities and mortgage loans as outlets for their funds.

After the outbreak of war in Korea in mid-1950, several steps were taken to restrict credit expansion without disturbing the stability of the government bond market. These included intensifying the drive to shift debt holding to nonbank investors; raising the federal reserve discount rates; and, in Jan. 1951, increasing the reserve requirements of member banks substantially to their upper legal limits. Nevertheless, in this period the total demand for long-term credit considerably exceeded the supply of funds becoming available from new savings and repayment of outstanding loans. Insurance companies and banks sold government bonds in heavy volume in order to meet this surplus demand, and the federal reserve system purchased the excess not bought by private investors so as to prevent declines in government bond prices. Such support purchases by the system increased both the money supply and the reserves available to banks for expanding credit.

The treasury-federal reserve agreement reached in March 1951 marked a major shift in debt management (and monetary) policy. In its government security transactions, the federal reserve system began placing greater emphasis on the supply and availability of bank reserves and less emphasis on maintaining fixed prices of government bonds. The system restricted its purchases of government securities and thereby reduced the supply of reserves made available to the banks. The prices of government securities were permitted to decline with market evaluations, and several of the long-term issues fell below par. Banks and other investors became less willing to convert their government securities at a market loss. The federal reserve regained considerable control over the availability of bank reserves, and a firmer money market and gradual rise in interest rates consequently developed.

Also in accordance with the March 1951 agreement, the treasury acted to immobilize part of the publicly held debt. It offered in exchange for the two longest-term 2½% bonds an issue of nonmarketable bonds with a longer term and higher interest coupon. The purpose of the offering was to encourage long-term investors such as insurance companies to retain their government securities, and thereby to minimize monetization of the public debt. Of the total of $19,700,000,000 of 2½% bonds covered by the exchange offer, $13,600,000,000 was converted.

Debt operations in the postwar period effected a striking redistribution in public debt ownership. (*See* Table IV.) The public debt and guaranteed securities held by banks declined from 43% of the total in Feb. 1946 to 32% in Sept. 1951.

In President Truman's Jan. 1952 budget message, it was estimated that total payments of interest on the public debt in fiscal 1953 would amount to $6,150,000,000—$300,000,000 higher than the estimate for fiscal 1952 and $535,000,000 higher than actual outlays in fiscal 1951. The projected rise in expenditures

was attributed both to an increase in the size of the interest-bearing debt and to higher interest rates. It was noted, however, that, because of the lag between new borrowings and initial interest payments, the anticipated $20,000,000,000 rise in debt during fiscal years 1952 and 1953 would not be fully reflected in increased interest payments until the fiscal year 1954.

U.S. State and Local Government Debt.—From June 30, 1950, to June 30, 1951, the aggregate debt of state and local governments in the U.S. increased almost $3,000,000,000—from $24,191,000,000 to $27,040,000,000. (*See* Table V.) State and local debt in 1951 was 70% higher than in 1946 and 34% higher than in 1940. Rising revenues and restricted expenditures had enabled state and local governments to reduce their total debt from $20,246,000,000 in 1940 to $15,922,000,000 in 1946.

Other Countries.—In Table VI are presented data on the national debts of many countries of the world. Insofar as permitted by information available at the close of 1951, the data are shown for 1939 and for 1949 or 1950, affording a comparison of national debts before and after World War II. (*See* also BUDGET, NATIONAL.) (C. F. Sz.)

Defense, U.S. Department of: *see* GOVERNMENT DEPARTMENTS AND BUREAUS, U.S.

Defense Mobilization Agencies, U.S.

The mobilization program in the United States came into being as a result of the unprovoked invasion of the Republic of Korea by North Korean armies—trained, equipped and inspired by the Soviet Union. That invasion began on June 25, 1950. On Sept. 8, 1950, the president signed the Defense Production Act of 1950, which laid the basis for the mobilization of the country's resources and the stabilization of its economy in the face of growing danger from aggressive nations.

The United States, in company with other countries of the United Nations, acted to repel the invaders in Korea and by Nov. 1950 the Communist armies of North Korea had been defeated and, for all practical purposes, destroyed.

However, the armies of Communist China then swept across the border and intervened in the Korean conflict. This action led the president of the United States on Dec. 16, 1950, to proclaim the existence of a national emergency. He said that "the increasing menace of the forces of Communist aggression requires that the national defense of the United States be strengthened as speedily as possible."

On that same day, the president, acting under authority of the Defense Production act, created the Office of Defense Mobilization (ODM). Its director was given authority "to direct, control and coordinate all mobilization activities of the Executive Branch of the Government, including but not limited to production, procurement, manpower, stabilization and transport activities."

As director of the Office of the Defense Mobilization the president named Charles E. Wilson, (*q.v.*), who thereupon resigned as president of the General Electric company. He had held a top post in the War Production board during World War II.

The Office of Defense Mobilization was a small organization which, administratively, was part of the executive office of the president. Consisting of Wilson and a few assistants, the ODM determined general policies to be followed in pursuing the two principal objectives of the mobilization program: (1) to gear United States industry for defense production and (2) to maintain the stability of the nation's economy.

ODM was strictly a policy-making, directing and co-ordinating group, as distinguished from an operating agency. It set the policies and saw that they were carried out; other agencies actually carried out those policies.

Set up at approximately the same time that ODM was created was an advisory group called the Defense Mobilization board. This board consisted of all the cabinet officers except the postmaster and the attorney general. It also included the chairmen of the Reconstruction Finance corporation, the national security resources board and the board of governors of the federal reserve system, and also the administrators of the Defense Production administration and the Economic Stabilization agency. The chairman of this group was the director of ODM.

The composition of this board reflected ODM's purpose to avoid the creation of a new and massive bureaucracy and to rely instead so far as possible upon existing departments and agencies of government.

Still another advisory group existed in the mobilization pattern, although this group was advisory to the president, not to ODM. This was the National Advisory Board on Mobilization Policy, established by the president on March 15, 1951. It was composed of the director of defense mobilization as chairman, and 16 other members appointed by the president. All these members represented the public, but the president's order specified that four should have had experience in business management, four in matters relating to labour and four in matters relating to agriculture. The board's function was to advise the president with respect to all phases of the mobilization program.

To supervise the field of production—one of the two main wings of the mobilization program—the president established the Defense Production administration (DPA). Manly Fleischmann, a lawyer of Buffalo, N.Y., was named the head of this agency.

DPA co-ordinated the operations of the several government agencies having defense production responsibilities. This included priorities and allocation of scarce materials both for defense and nondefense production purposes; also procurement, contracting and construction, as well as the conversion, requisitioning or expansion of production facilities and the financing thereof.

The DPA operated through the National Production authority of the department of commerce; it also operated through the departments of labour, interior and agriculture, and the Defense Transport administration, board of governors of the federal reserve system, Reconstruction Finance corporation, General Services administration and Housing and Home Finance agency.

Either all or part of the aforementioned agencies had some responsibility in the production end of the mobilization program.

To co-ordinate efforts in the field of economic stabilization the president created the Economic Stabilization agency (ESA), whose administrator was Roger L. Putnam. Its responsibility was to plan and develop price and wage stabilization policies; inform the country of the need for stabilization and encourage voluntary action to this end; and consult with government officials handling procurement, production, manpower, rent control, fiscal credit and monetary policies concerning measures within their jurisdiction which would assist stabilization.

The price control functions of this phase of the program were handled by the Office of Price Stabilization, headed in 1951 by Michael V. DiSalle. The wage aspect was the province of the Wage Stabilization board, consisting of 18 members—6 representing the public, 6 labour and 6 business and industry—and headed by Nathan P. Feinsinger.

Also under ESA were two other agencies, the Rent Stabilization board, headed by Tighe E. Woods, and the Salary Stabilization board, headed by Raymond B. Allen. The latter group was responsible for the stabilization of salaries of professional persons not represented by labour organizations.

"BUT FIRST A FEW WORDS FROM OUR SPONSORS—" a cartoon by Herblock which appeared in the *Washington Post* in 1951

ODM's basic plan was to make it possible within a period of three years to fight an all-out war, if necessary, directly from the production lines.

Meanwhile, ODM had to see to it that all necessary arms and materials were provided for the armed forces, whether they were fighting in Korea or were in garrison in Europe or in training in the United States. ODM had also to see that there were sufficient stores in the national stock pile of materials required for full-scale war, and also that arms and equipment were manufactured in sufficient quantity over and above the country's own needs so as to assist the growing defense forces of other free nations.

The program was based on the projected expenditure of about $150,000,000,000 for the three-year period, or an average of $50,000,000,000 a year.

The plan, as laid down, called for minimum disturbance to the normal civilian economy. Some cut in consumer durable goods was necessary because of shortages of materials and of the utilization of factories and tools in the making of defense items. However, the plan contemplated such expansion of productive facilities and of raw materials production that eventually the civilian goods would flow in normal quantity alongside the output of military goods.

The United States program of defense mobilization was tied in closely with similar programs of other free nations. For the fiscal year ending June 30, 1952, congress appropriated $7,300,000,000 for military and economic assistance to other free nations.

All told, 1951 was a year of considerable progress toward achieving the strength to deter aggressor nations.

Broadly, the following things were accomplished:

1. More than 1,000,000 men and women were added to the armed forces. The air force added 28 groups and at the end of 1951 had a total of 90 groups. The number and strength of the army's divisions were increased. The navy returned more than 270 vessels to active duty from the "moth ball" fleet.

2. A rate of about $2,000,000,000 a month in deliveries of military procurement and construction was reached—more than three times the rate of a year before.

3. Expansion programs were launched in every sector of the economy where greater production was needed to support a sustained military production effort and a healthy economy.

4. The groundwork was laid for a much greater expansion both in military production and in basic industry. The building and equipping of plants dominated the economy in 1951. In the making of an aeroplane, a tank or any other complex military item, thousands of actions must be taken in making ready for production before the first mass-produced item comes off the assembly line. In industrial expansion, foundations must be poured and walls erected before the plant can be equipped and production actually begun. In both these fields, 1951 was the year of preliminary work, of making ready. The results would come in 1952 and 1953.

5. Orders were placed for $45,000,000,000 in military goods, bringing total obligations to $63,000,000,000.

In the doing, there was relatively little dislocation of the civilian economy. There were relatively few business shutdowns and little unemployment. Since early 1951, the economy had been virtually stabilized.

The record was marred to some degree by delays in production for many reasons, one of which was the bottleneck in machine-tool production. Shortages of many of the metals basic both to military and civilian production hurt the program. Economic stabilization suffered by reason of weak legislation in the area of price and credit controls. Popular opinion, which is needed to support any national mobilization program, showed the lack of a sense of urgency in the absence of all-out war. Nevertheless, the nation's progress was considerable.

At the close of 1951 a plan for the distribution of materials was in operation. Up to that time it had been on the basis of allotting to military production its full need for metals. After that, the supply was distributed among the elements of the civilian economy and exports to friendly countries in such a way as to provide for the expansion as necessary of the defense-supporting activities and still to maintain production of civilian goods where possible.

The diversion of a great part of the resources of the United States to military needs did not, in 1951, cause any great decline in the standard of living. The impact was expected to be more widely felt in 1952.

In specific areas of the mobilization program, the accomplishments were as follows:

Transportation.—The volume of railroad freight transportation, which increased substantially after the beginning of the Korean war, was maintained throughout 1951 at a level almost 20% above the pre-Korean war period. Production of about 96,000 new freight cars and 2,550 diesel locomotives during the year, together with a reduction in the number of cars under repair, enabled the railroads to meet requirements. While the full car-building program of the industry had to be curtailed because of material shortages, serviceable freight cars at the end of 1951 were estimated to be up 2.4%, or more than 40,000 cars, over the level of a year before. (*See* also RAILROADS.)

Commercial ocean ship loadings in U.S. ports during the first half of 1951 were up 50% over the pre-Korean war level, with volume continuing at a high level during the balance of the year. Export of 28,000,000 tons of coal to Europe and grain shipments to both Europe and Asia were primarily responsible. To meet requirements, more than 800 merchant vessels built during World War II were reactivated from the reserve of 1,451 ships. By Nov. 1, 1951, the active U.S. merchant fleet totalled 2,000 vessels, of which 1,300 were in private ownership. At the

"HOW TO CURB INFLATION," a 1951 cartoon by Fitzpatrick published in the *St. Louis Post-Dispatch* (Mo.)

end of 1951, 73 seagoing vessels of 1,000 gross tons and over were under construction or on order. Two large passenger ships were completed; a third, the largest ever built in the United States, was nearing completion, along with three transports for the navy. The government undertook the construction of 35 fast, newly designed "mariner-type" dry cargo vessels and 15 keels were laid by the end of 1951. (*See* also Shipping, Merchant Marine.)

Iron-ore shipments on the Great Lakes in 1951 reached 89,000,000 gross tons—14% over 1950. Fourteen large Great Lakes bulk carriers, of 20,000 gross tons capacity each, were being built in private shipyards to be completed in 1952 and 1953.

Air traffic increased 30% in 1951. To handle the larger volume, 79 passenger and cargo aircraft and more than 2,400 private aircraft were delivered in 1951. An additional 397 transport planes and more than 8,500 smaller planes were approved for construction during 1952 and 1953. (*See* also Aviation, Civil.)

Manpower.—Voluntary labour-management committees were established at national, regional and local levels to help achieve manpower objectives of the mobilization program. The total labour force expanded by 300,000 more than the normal increase during the year, as more women, older and retired workers and handicapped people were utilized. Peak civilian employment was 62,600,000 in August. Despite substantial layoffs in textile, apparel and leather centres and in certain consumer durable-goods industries, unemployment in November was only 1,800,000—400,000 less than in Nov. 1950. The sharp increase in nonfarm employment in the first year following the Korean attack—amounting to about 2,600,000—represented one of the greatest rises on record. The sharpest relative increases occurred in such industries as aircraft and metalworking machinery. During 1951 the female labour force increased by 300,000. Under the state-federal program of rehabilitation, more than 50,000 disabled persons were prepared to take jobs in 1951.

A monitoring system was established to prevent placement of defense contracts in areas where there were labour shortages. A Facilities Review board was established in the Defense Production administration to examine proposed projects for the purpose of utilizing not only idle men but idle plants as well.

Shift of farm workers to industry and the armed forces reduced the nation's farm labour force about 350,000 in 1951 to the lowest number of farm workers on record. Even so, one of the largest crop harvests in history was achieved in 1951. This was made possible by more efficient and widespread use of labour-saving machinery, more hours of work and better farm management. About 200,000 foreign contract workers were employed in agriculture in 1951 compared with 94,000 the previous year. (*See* also Census Data, U.S.; Employment.)

Military Production.—During 1951 the armed forces were provided with equipment, supplies and construction with a total value of $16,000,000,000. At the beginning of 1952, United States industry was working on outstanding orders of about $40,000,000,000, or more than twice the volume that had been delivered since the start of the Korean war. The aircraft industry, which was devoted virtually 100% to military goods, expanded more than 50% in 1951. (*See* also Aircraft Manufacture.)

Machine Tools.—The bottleneck in machine tools was broken. Shipments at the end of 1951 were at the annual rate of about $800,000,000 and were expected to rise to a level of about $1,250,000,000 in the third quarter of 1952.

Reserve Plants.—About 90% of the 179 defense plants built by the government during World War II and retained in the national industrial plant reserve were in operation during 1951 or were being reactivated for use in the defense program.

Plant Expansion.—Total contracts awarded for new privately owned factory construction in 1951 amounted to $2,200,000,000, a 69% rise over 1950. To assist in the expansion programs, the government authorized accelerated tax amortization in the sum of $11,400,000,000. As of Dec. 7, $190,000,000 in direct loans had been extended to 93 firms and credits of $1,200,000,000 had been made available through loans by Oct. 31, 1951. (*See* also Building and Construction Industry.)

Steel.—The steel industry at the end of 1951 was producing at the annual rate of 108,000,000 ingot tons, compared with a rate of fewer than 100,000,000 ingot tons in June 1950. Additional capacity under construction would enable the industry to produce at a sustained level of 120,000,000 ingot tons by 1954. (*See* also Iron and Steel.)

Aluminum.—At the close of 1951, aluminum was being produced at an annual rate of 860,000 tons, as compared with 735,000 tons when the Korean war began. (*See* also Aluminum.)

Power.—More than 7,000,000 kw. were added to the nation's electric power supply during 1951, an increase of about 10% over the capability a year earlier and the greatest expansion in a single year in the history of the industry. (*See* also Electrical Industry.)

Minerals.—Significant progress was made in 1951 toward expanding the domestic supply of a long list of critical minerals, ranging from copper and lead to such little-known minerals as mica and columbium. The government was using powers granted by the Defense Production act to contract with prospectors and mine operators to explore for new mineral deposits. Delaware. Delaware, on the middle Atlantic seaboard, one of the original 13 states of the United States, is called the "First state," having been the first to ratify the federal constitution, Dec. 7, 1787. The "Diamond state" is also a popular name. Area: 2,057 sq.mi. (land 1,978; inland water 79). Population (1950 U.S. census): 316,715, compared with (1940) 266,505. Of the latter, native white numbered 215,695; foreign-born 14,913; Negro 35,876.

History.—The 1951 regular session of the legislature took final action on a constitutional amendment creating a separate supreme court and simplifying the state court system. Further outstanding measures were the creation of a state commission on children and youth and the consolidation of welfare agencies into a state department of public welfare.

In June was celebrated the 300th anniversary of the founding of New Castle by the Dutch; delegates from the embassies of nine European governments were present. The $44,000,000 Delaware Memorial bridge linking the express highway systems of Delaware and New Jersey was opened in August.

The chief state officers in 1951 were: governor, Elbert N. Carvel; lieutenant governor, Alexis I. du Pont Bayard; secretary of state, Harris B. McDowell, Jr.; tax commissioner, Howard S. Abbott; bank commissioner, Randolph Hughes; chancellor, J. Collins Seitz; attorney general, H. Albert Young; insurance commissioner, William R. Murphy; state treasurer, Ralph W. Emerson; state auditor, George Daniel Enterline, Sr.; adjutant general, Brig. Gen. Joseph J. Scannell; director, legislative reference bureau, Robert W. Tunnell.

Education.—The state provided in 1951 for a building and school plant improvement program costing $16,424,318, of which the state's share totalled $10,580,313, the local share $5,844,005. An average of $150,000 per year was appropriated for education, training and transportation of handicapped children. During the fiscal year ending June 30, 1951, the state board of vocational education placed 433 disabled persons in earning jobs. The state superintendent of public instruction in 1951 was George R. Miller, Jr.

The cost of operating the public schools for the fiscal year was $11,816,938. The expenditure per pupil increased from $243.42 to $280.65. The 139 elementary schools had an enrolment of 29,960 and a teaching staff of 1,030. The 48 secondary schools had 17,580 pupils and a teaching staff of 906.

Social Insurance and Assistance, Public Welfare and Related Programs.—Servicemen's readjustment allowances paid in 1951 declined to $609; state unemployment compensation, $963,639; the number of active claims in the last week of Dec. 1951 was 1995. The cost of outside relief for the calendar year was $478,858 for an average of 950 cases per month. The cost was shared half and half by the state and the county in which the relief was given. In Dec. 1951, 1,623 persons were receiving old-age pensions compared with 1,614 in Dec. 1950.

During the fiscal year ending June 30, 1951, 843 children were cared for in their own or foster homes at a cost of $296,393; the number of dependent children aided was 2,899 at a cost of $699,714. The state appropriation for public welfare was $3,905,420 (not including additional grants to semipublic institutions). Included were Ferris school (industrial for boys) $220,950 and Kruse school (correctional for Negro girls) $55,130. The New Castle county workhouse which accepts some long-term prisoners from the other counties (there is no state prison) received 2,436 prisoners during the fiscal year and discharged 2,446. There were 322 inmates on June 30, 1951.

Communications.—The mileage of highways including rural roads under state control was 3,926. The income of the state highway department for the fiscal year ending June 30, 1951, including federal aid of $2,042,524, was $10,999,115. Railroad mileage was approximately 270.

For the calendar year tonnage at the port of Wilmington was 593,853 compared with 692,042 for the year 1950; the value of cargoes was $31,282,481 compared with $34,972,936 in 1950. Cargo tons (2,000 lb.) through the Delaware and Chesapeake canal in 1951 were 8,612,630; transits of vessels 15,802. The four certified air lines and one certified freight line carried 15,925 passengers, 120,311 lb. of air mail, 282,968 lb. of air express and 1,759,870 lb. of air freight. On Dec. 31, 1951, the state had 127,730 telephones in use.

Banking and Finance.—In 1951 there were 27 state banks, mutual savings banks and trust companies with 20 branch banks and branch offices; 13 national banks, 39 building and loan associations and 17 small loan companies. Total assets of all state banks June 30, 1951, were $659,470,853 compared with $651,190,763 on the same day in 1950; deposits June 30, 1951 were $589,263,396 compared with $580,305,507 in the same day in 1950. Assets of the national banks were $48,499,378 June 30, 1951, compared with $42,860,446 on the same day in 1950.

Total state revenue for the year ending June 30, 1951, was $30,522,936; nonrevenue income was $15,660,306; cash balance at the beginning of the year was $36,920,525. Expenditures were $53,339,626. The gross debt was $37,309,000. Total debt service (interest and redemptions) was $2,492,466.

Agriculture.—The estimated total cash income from agricultural production in 1951 was $110,000,000. Total livestock income (estimated) was $80,065,000 (including large broiler industry for which separate data were not available). The total from crops from January to October was $20,999,000.

Table I.—*Leading Agricultural Products of Delaware*

Crop	1951	1950	Average 1940–49
Corn, bu.	5,735,000	5,168,000	4,042,000
Apples, bu. (commercial)	554,000	525,000	626,000
Hay, tons	100,000	99,000	97,000
Wheat, bu.	1,189,000	1,020,000	1,231,000
Soybeans, bu.	884,000	882,000	465,000
Peaches, bu.	385,000	225,000	370,000
Oats, bu.	256,000	224,000	149,000
Barley, bu.	341,000	336,000	273,000
Potatoes, bu.	700,000	584,000	342,000
Tomatoes, tons (processed)	30,800	40,300	
Strawberries, crates	85,000	50,000	
Lima beans, tons shelled	18,340	15,610	

Table II.—*Principal Industries of Delaware*

Industry	1951	1950
Food	$53,664,118	$67,461,557
Clothing	19,782,981	75,811,606
Household supplies	961,488	1,129,538
Auto supplies	8,568,939	10,227,693
Drugs and medical supplies	16,923	3,274,467
Tobacco	3,598,239	433,938
Miscellaneous	128,283,488	126,934,254

Manufacturing.—Gross receipts of the 710 licensed manufacturers for the year ending June 30, 1951, were $214,876,246, compared with 979 licensed manufacturers the previous year with gross receipts of $285,273,053. The total number of employees under the unemployment compensation law June 30, 1951, was 111,314. Total wages paid for the year ending June 30, 1951, were $370,279,980. On Nov. 15, 1951, 549 plants in the Wilmington area reported an employment total of 65,754 compared with 62,785 for Nov. 15, 1950. New corporations chartered at Dover for the year ending June 30, 1951, were 2,592 compared with 2,464 the previous year. Corporations which became void totalled 1,171, the same as the previous year.

(J. En.)

Mineral Production.—Delaware has the smallest mineral output of any state, and that entirely in building materials. In 1949 the output included 33,212 short tons of clays ($46,293), 233,977 tons of sand and gravel ($196,451) and 37,240 tons of stone ($92,100); total value $334,844. In 1950 output increased to 41,000 tons of clays ($40,375), 367,524 tons of sand and gravel ($291,715) and 77,050 tons of stone ($190,113); total value $522,203.

Democracy.

Democracy in this article means that form of government and way of life which was developed in western Europe and North America, following the example of 17th century England, in the constitutional struggles of the 18th and 19th centuries. It is based upon a multiparty representative system in which the voters have the choice among alternative governments, upon respect for individual liberty and the independence of the judiciary from political influence, and upon freedom of discussion and expression in the political and cultural fields. This form of democracy, which strives to make opposition a constructive part in the process of government instead of declaring it a hostile force, has been regarded by Communists and fascists, however, as unable to cope with the industrial, international and cultural problems of the modern technological mass civilization. Communists and fascists have insisted upon the "immorality" of this democracy which they call "plutocracy" and have predicted its early and inevitable decay as a result of economic crises and social disintegration.

Contrary to these predictions, democracy in 1951 as in the preceding years showed no sign of collapse. It is true that in Italy and France, the two democratic countries in which com-

U.S.A.F. SEMINAR based on pictorial "stimulators" to provoke discussions about basic democratic principles, a 1951 experiment. Sample question to a picture: Should the driver swerve into a ravine and risk himself and truckload of troops to avoid hitting a child, or stay on the road?

munism exercised a strong appeal among the working classes, the peasants and a large part of the intellectuals, elections held in 1951 revealed the continuous strength of the antidemocratic forces. Elections in Italy were held for municipal and provincial assemblies, and though a number of important Italian cities replaced their former Communist mayors by democratic representatives, the total vote of Communists and Communist sympathizers showed no decline.

In the elections to the French national assembly in June 1951, the first national balloting in France since 1946, the number of Communist deputies was sharply reduced from 181 in 1946 to 103. But this was not the result of any similar drop in the popular vote for the Communists. It was the effect of the new electoral law which encouraged voting alliances among the centre parties against the Communists. While the popular vote for the Communists declined by 9%, nevertheless they still received the largest number of votes for any single party, 26.5% of the total vote as against 28.2% in the elections of 1946. The chief sufferers in the election, as compared with 1946, were the Popular Republican movement (M.R.P., a democratic Catholic party) and the moderate Socialists, while the greatest gain was made by the Rally of the French People (R.P.F.), the party led by Gen. Charles de Gaulle. This party had not participated in the 1946 elections. It received 21.7% of the popular vote in 1951 and was the second strongest party in the national assembly.

The impressive strength of democracy in countries where it is historically rooted was demonstrated in Great Britain's national election. In spite of the precarious economic situation and the continuing food rationing and shortages, the Communists polled only 21,640 votes or 0.07% of the total as against 91,746 or 0.3% of the total in the national elections of Feb. 1950. Nor had Great Britain any counterpart of a fascist or semifascist authoritarian party. The popular vote was almost equally split between the Labour party, which received 13,949,105 votes, and the Conservative party with its 13,730,742 votes. Though the Conservatives captured a majority of the seats in the new house of commons and thus were able to form the new administration under Winston Churchill, the outcome of the elections confirmed the stability of Britain's democracy. A crushing defeat of Labour or a Conservative landslide might have increased the social tension; the slight majority which the Conservative administration gained in the house of commons would probably force it to do its very best and to follow a cautious policy of recovery and efficiency.

The Greek elections in Sept. 1951 showed a consolidation of the centre parties. The Union of Democratic Leftists, which though not openly Communist was composed largely of Communist sympathizers, gained 10 of the 258 assembly seats. The Populist party of Constantin Tsaldaris, which represented the rightist elements in former Greek parliaments, was practically wiped out by the successes of the Greek Rally party of Field Marshal Alexander Papagos, which received 115 of the 258 seats.

Of special interest were the elections in the two border countries situated between Communist-controlled Europe and western Europe, Austria and Finland. In Austria elections for the office of the president were held in May 1951, the first nationwide voting since the parliamentary election of 1949. Austrians in the zone occupied by the Soviet Union voted as freely as those living in the areas under U.S., British or French occupation. Of the four major candidates (two minor candidates received a total of 7,542 votes), the candidate of the People's party (conservative and Catholic) received 1,725,695 votes; the candidate of the (moderate) Socialists, 1,682,786; the candidate of the league of Independents, 662,559; and the Communist candidate, 220,012. Under these conditions a runoff election between the People's and the Socialist candidates was necessary. The Socialist candidate, Theodor Koerner, who was a well known anti-Communist, was elected. He received 2,172,806 votes as against 2,004,290 for his opponent. The Communists had polled about 5% of the popular vote, about the same as they had done in 1946 and 1949. This was another proof of the stability of the democratic forces in this republic.

In the elections to the Finnish diet in July 1951 the Communists recaptured 7 of the 11 mandates they lost in the 1948 election. They remained the third strongest party, with 45 seats in a diet of 200 seats. The strongest party were still the anti-Communist Social Democrats, who received 53 seats. The Social Democrat voters in Helsinki, Finland's capital, returned as their choice with an impressive majority former Premier Vainoe Tanner, one of the men who were imprisoned after Finland's defeat in World War II on charges of having drawn Finland into the war against the Soviet Union. Thus, in both borderlands living under the shadow of the soviet military force, democracy held its own.

Democracy in Europe continued to be strengthened in 1951 by the progressive development of democratic federalism in the movements aiming at the creation of a European union or, on a wider scale, of an Atlantic union which would include the democratic countries of western Europe and North America. This democratic federalism, a development which began only after World War II, had its foundation in the need for common defense against totalitarian aggressiveness. Its aims were later extended beyond this initial purpose toward a closer cultural and economic integration of the various nations with a common democratic heritage.

In Latin America and in Asia democracy had no comparable historical roots. But the International Confederation of Free Trade Unions, which was founded in 1950 to counteract the Communist-dominated World Federation of Trade Unions, was successful in spreading free unionism among the workers in Asia and Latin America. In Jan. 1951 a western hemisphere branch of the International confederation was established at a conference in Mexico City, Mex. The inter-American regional organization had its seat in Havana, Cu. It refused to invite delegates from Argentina, the Dominican Republic or Panamá because they lacked independent workers' unions, and the International confederation was opposed to all totalitarianism, fascist as well as Communist. The Mexican Workers confederation (C.T.M.) refused to join the new regional unit. At the end of May a similar regional meeting for Asia was held in Karachi, Pak. The success of the United Nations under the leadership of the United States and other democracies in resisting Communist aggression had strengthened throughout Asia confidence in the democratic ability to halt further Communist expansion. Though the economic burden of armament in the wake of the Korean War appeared in 1951 as a potential brake on the rapid progress toward greater social well being in the democracies, it was felt that the growing close co-operation of the democracies might well preserve the gains which had been made and strengthen democratic vitality to cope with the great problems of the mid-20th century. (*See* also COMMUNISM; EDUCATION; ELECTIONS; EUROPEAN UNION; FASCISM; GREAT BRITAIN; SOCIALISM; UNITED STATES.) (H. Ko.)

Democratic Party. The year 1951 was a disturbing year for the Democrats as a result of congressional investigations of several executive agencies, more than 100,000 casualties in the Korean war and high prices and taxes accompanying the costly rearmament program. As the year ended, the administration of Pres. Harry S. Truman was clearly on the defensive in the face of its political enemies' attempts to capitalize on this combination of events.

The 1951 election results reflected an antiadministration swing. In ten special elections to fill vacancies in the house of representatives, the Democrats suffered a net loss of two seats, reducing their membership to 232, as against 201 Republicans, 1 Independent and 1 vacancy. They gained a senate seat with the death of Sen. Arthur H. Vandenberg of Michigan. Gov. G. Mennen Williams named Blair Moody, a fellow Democrat, to the vacancy. This made the senate alignment 50 Democrats and 46 Republicans. The G.O.P. contingent dropped to 45 with the death in November of Sen. Kenneth S. Wherry of Nebraska, minority floor leader, but Gov. Val Peterson named another Republican, Fred A. Seaton, to fill Wherry's place at the 1952 session.

The mayoralty elections on Nov. 6 were also adverse to the party in power, as the Republicans carried a majority of the cities in such industrial sections as New England, New York, New Jersey, Pennsylvania, Ohio and Indiana. However, Frank E. McKinney, Democratic national chairman, denied the outcome had any national significance, blaming the results on local issues. The upsets in New York city and Boston obviously disturbed Democratic leaders, however, since the principal issue in the three cities was government corruption at local and national levels.

In New York city the voters elected Rudolph Halley, an Independent, as president of the city council over Democratic and Republican opposition. Halley's principal asset was his role as counsel for the Kefauver crime committee, a senate group which exposed at televised hearings an alliance between some Democratic politicians and the underworld in New York city and elsewhere.

In Philadelphia, however, a Republican machine was driven from power after more than 65 years of control, when City Controller Joseph S. Clark, Jr., a Democrat, defeated Daniel A. Poling, a Baptist minister who had been nominated by the Republicans in an effort to placate the electorate.

The corruption issue figured in these and other contests not only because of local misrule, but also because of congressional revelations of alleged incompetency and laxity in the Reconstruction Finance corporation, the bureau of internal revenue and the department of justice.

The Fulbright committee, for instance, developed that Democratic politicians, including former National Chairman William M. Boyle, Jr., were able to obtain Reconstruction Finance corporation loans for friends even in the face of adverse reports by the agency's examiners. Numerous White House attachés were shown to have received expensive gifts and other favours from applicants for loans.

The Kefauver-Halley hearings disclosed the existence of a close relationship among Democratic officials, the police and the underworld in New York; New Jersey; Chicago, Ill.; St. Louis and Kansas City, Mo.; and Miami, Fla. These revelations had an unusually important and widespread political effect because they were televised.

Quite as harmful to the Democrats were the King committee's disclosures of corruption in the bureau of internal revenue. By the end of 1951, 166 internal revenue officials, including 6 presidentially appointed collectors, had been indicted, suspended or discharged.

President Truman precipitated a politico-military controversy in April when he removed Gen. Douglas MacArthur as United Nations commander in Korea on the ground that his statements, letters and actions violated administration policy. Returning home to tumultuous welcomes by congress, numerous cities and state legislatures, MacArthur delivered a series of speeches attacking "internal subversion, corruption and detailed regimentation" at Washington, D.C. A senate committee investigation of the ouster resolved itself into an inconclusive debate over the administration's far eastern policy.

In a follow-up inquiry, a senate judiciary subcommittee, headed by Sen. Pat McCarran of Nevada, sought to show that communistic influences in the state department had been responsible for the fall of China to Mao Tse-tung's red regime.

The president continued to have difficulties with southern Democrats of the states' rights school, headed by Sen. Harry F. Byrd of Virginia and Gov. James F. Byrnes of South Carolina. In combination with Republicans, the southern bloc prevented legislative action on the domestic Fair Deal, as they had done since Truman took office in 1945.

In a speech at Atlanta, Ga., on June 24, Byrd raised openly the flag of rebellion from the party, calling for defeat of a Truman-led faction in the 1952 presidential election.

Outwardly, Truman did not appear concerned by the year's untoward developments or by adverse popularity polls. He said that he did "not expect to be judged properly for 25 or 30 years." In early fall he said he had made his 1952 plans, but "was not telling anybody." He noted, however, that the 22nd amendment, which prohibits more than two terms, did not apply to him. (*See* also ELECTIONS; MACARTHUR INVESTIGATION; UNITED STATES.) (R. TU.)

Denmark.

A monarchy of north central Europe, Denmark has an area of 16,569 sq.mi. Pop.: (1945 census) 4,045,232; (preliminary 1950 census) 4,279,151. Capital: Copenhagen (731,707, or including Frederiksberg and Gentofte 927,404; 1948 est., 979,880). Other principal cities (1945 census): Aarhus (107,393); Odense (92,436); Aalborg (60,880). Religion: Lutheran Christian. Ruler in 1951: King Frederick IX; prime minister: Erik Eriksen.

History.—During 1951 Denmark was in full sympathy with the United Nations and the North Atlantic Treaty organization, but also felt small and helpless, and some critics accused the country of dragging its feet in the strenuous western effort to rearm. Gen. Dwight D. Eisenhower praised the Danish spirit in January, and in May urged the Danes to extend their 12-month period of military service to 18 months. This request the government rejected, partly because of the difficulty of training officers for the projected force of 100,000 men. A group of young officers went to the United States for special training, but the Danes felt keenly their long nonmilitary tradition and the annihilation by the nazis of what organization and equipment they had. Gradually government and people woke to the necessity for greater actual military strength. The increase in term of service to 18 months was finally approved by the *folketing* in December. The defense budget was increased, and at the close of the year a battalion was in process of organization to be turned over to the supreme commander of the Allied forces in Europe.

It was inevitable that the Soviet Union should charge that Denmark was being made into an advanced armed base of the western Allies. Ole Bjørn Kraft, foreign minister, when asked rhetorically why Denmark entered the Atlantic pact, answered, "Because we felt uneasy over developments, because we wished to do what was in our power to protect our peace and our freedom, and because we were and are convinced that the Atlantic Pact is a means to guard peace and to save the freedom which gives value to peace. . . . Who could think that Denmark with its geographic position, its whole view of life, and its military weakness should join a pact with aggressive aims?"

The United States extended varied kinds of aid to Denmark. The Fulbright system for exchange of scholars was in August extended to Denmark and the Economic Cooperation administration granted $325,000 of technical assistance funds for research on methods of increasing Danish agricultural and industrial production. The new Greenland agreement (*see* GREENLAND) went into effect in June. The general trade treaty between Denmark and the U.S. dating from 1826 was replaced by a more up-to-date treaty signed in Copenhagen in October.

Denmark's economic problems were largely problems of the world and its money. Denmark vigorously increased its production and doubled the quantity of its exports over 1947. But the prices paid for imported goods were rising 50% while the prices received for exports were rising only 5%. This squeeze made Danes tighten their belts, and made them complain about the United States restrictions on admission of Danish cheese. With Great Britain the Danish problem was to get adjustments in prices rapidly enough to keep up with rising costs. But neither the spring nor the autumn negotiations succeeded in doing so. Denmark began to realize that its dependence on the British market must be broken by agricultural changes. The wholesale price index rose from 283 to 386 (1935=100) between June 1950 and July 1951.

Denmark made new trade agreements during the year with the Netherlands, Switzerland, Portugal, Finland, Iceland, Sweden, Norway, Spain, Hungary, Greece, Argentina and Indonesia. Its trade with eastern Europe rose to 141% (in terms of equality of prices) of the prewar trade. This was in large measure the result of Danish need for Polish coal. In addition to a 1948 agreement to supply the U.S.S.R. with three tankers and five refrigerator ships, Denmark contracted in Jan. 1951 to deliver to the Soviet Union eight fishing boats of 250 tons each. Denmark also made a barter agreement with the U.S.S.R. to exchange 2,000 breeding cattle for 31,700 tons of potassium.

The Danes continued to be deeply disturbed by the refugee situation in Schleswig-Holstein. The Bonn government was obviously unable to move more than 1,000,000 people from the province. But the large numbers of refugees from east Germany and a new election law threatened in the fall to deprive of the vote a Danish minority of about 71,000. (F. D. S.)

Education.—Schools (1949): elementary, middle and secondary 4,112, pupils 494,905; technical 340, pupils 56,000; commercial 207, pupils 34,400; agricultural 26, pupils 2,300; adult 56, pupils 6,500; teachers' training colleges 18, students 2,400; universities 2, professors and lecturers 270, students 7,400; institutions of higher education 5, professors and lecturers 152, students 3,958. No illiteracy.

Finance and Banking.—Budget: (1950–51 est.) revenue 2,403,000,000 Kr., expenditure 2,391,000,000 Kr.; (1951–52 est.) revenue 2,700,000,000 Kr., expenditure 2,690,000,000 Kr. Gross national debt (March 1948) 9,630,000,000 Kr. Currency circulation (Aug. 1951) 1,491,000,000 Kr. Bank deposits (Aug. 1951) 4,725,000,000 Kr. Gold and foreign exchange (Sept. 1951) U.S. $97,200.000. Monetary unit: krone, with an exchange rate of 6.92 Kr. to the U.S. $1.

Foreign Trade.—(1950) Imports 5,890,000,000 Kr.; exports 4,592,000,000 Kr. Main sources of imports (1950): U.K. 32%; Germany 11%; U.S. 9%; France 9%; Sweden 8%. Main destinations of exports: U.K. 42%; Germany 19%; Sweden 6%; Norway 4%; Finland 4%. Main imports: coal, petroleum and products 17%; textiles 16%; machinery and vehicles 11%; wood, paper and manufactures 8%. Main exports: dairy products 33%; meat and products 22%; machinery 7%; live meat animals 6%.

Transport and Communications.—Roads (1950) 34,300 mi. Licensed motor vehicles (Dec. 1950): cars 117,000; commercial 62,000. Railways (1950): 2,996 mi.; passenger-miles 1,875,000,000; freight, ton-miles, 744,000,000. Shipping (merchant vessels of 100 gross tons and over, July 1950): 718; total tonnage 1,269,011. Air transport (1950): passenger-miles 92,000,000; cargo, ton-miles, 2,700.000. Telephones (1949): subscribers 542,000. Radio receiving set licences (1950): 1,236,274.

Agriculture.—Main crops (metric tons, 1951): wheat 275.000; barley 1,730,000; oats 780.000; rye 230,000; potatoes (1950) 1,850,000; sugar, raw value 360,000. Livestock: cattle (March 1951) 3,075,000, including 1,710,000 dairy cows; sheep (July 1950) 61,000; pigs (March 1951) 3,541,000; horses (July 1950) 503,000; goats (July 1949) 4,000; poultry (July 1950) 24,433.000. Dairy products (metric tons, 1950): milk 5,413,000; butter 179,000; cheese 61,000; eggs 132,000. Meat production (metric tons, 1950): total 510,000, of which beef and veal 168,000, pork 342,000. Fisheries (1950): total catch 235,000 metric tons valued at 165,000,000 Kr.

Industry.—Industrial establishments (June 1948): 109,288; persons employed 641,379. Fuel and power (1950): coal distributed 8,400,000 metric tons; lignite 768,000 metric tons; manufactured gas 377,400,000 cu.m.; electricity 1,814,400,000 kw.hr. Cement production (1950) 872,400 metric tons. New dwelling units completed (1950) 19,968. Index of total industrial production (1950) 118 (1948=100).

Dentistry.

At its meeting in Oct. 1951, the American Dental association introduced for the first time the use of colour television as a method of demonstrating to large numbers of people operations and technical procedures within the mouth. By using eight television sets, more than 600 people were able to see at one time operations and technical procedures that were being conducted in a clinic several miles away. The colours came through clearly and accurately; visibility was excellent, and the pictures seemed to have a third-dimensional quality, although no stereoscopic projection was used. Previously, operations within the mouth could be demonstrated to not more than five or six people at one time and even then visibility was not always good.

According to a report of the Council on Dental Health of the American Dental association as of July 1, 1951, fluoridation of public water supplies was in operation in 102 towns and cities and in two state training institutions, and there were indications that the number was steadily increasing. In several parts of the country, some militant resistance to fluoridation appeared. This opposition was based on the ground that fluoridation is an undermining of individual freedom; that it is an insidious way of regimenting a community in regard to specific forms of medication; and that it forces people to consume daily a medicine which many people have no desire to take. To obviate these objections, the question of fluoridation was being submitted to the voters in some communities before authority was given to proceed with it.

In support of fluoridation, on Dec. 1 the American Medical association reported that such treatment of public water supplies to reduce the incidence of dental caries is a safe procedure.

LIVING TOOTH (the shorter one on the left) transplanted from one kitten to another in 1951 at the College of Physicians and Surgeons, Columbia university, N.Y. Interest in the experiment lay in the possibilities of replacing decayed human teeth with healthy living ones

The American Medical association's statement was prepared jointly by the Council on Pharmacy and Chemistry and the Council on Foods and Nutrition. A subcommittee on fluoridation of the National Research council also issued a report urging that the procedure be considered by all fluoride-deficient communities.

A new method for removing decay in teeth and preparing them for filling and also for removing deposits and stains on teeth attracted wide attention in 1951. This was known as the "airbrasive" technique. A stream of abrasive is delivered to the tooth at high velocity, the abrasive particles travelling at speeds well in excess of 1,000 ft. per second. It was claimed that when a hard abrasive such as aluminum oxide is employed, any area of the tooth that the stream reaches is rapidly cut away. When a softer material is used, deposits and stains may be quickly removed without damage to the enamel of the tooth.

The airbrasive technique has as its objective the eliminating of the three objectionable characteristics of the dental drill—pressure, vibration and heat—and the pain that is often associated with them. During the year, the airbrasive method was being taught in some dental schools. (L. M. S. M.)

Dermatology.

Studies during 1951 indicated that seborrhoea and seborrhoeic dermatitis, characterized by bothersome oiliness, redness, scaling and itching of the face and scalp, might be the result of a metabolic defect in the skin which increases the local requirement for pyridoxine, a fraction of the vitamin B complex. Seborrhoeic dermatitis was experimentally induced in a group of persons by treating them with desoxypyridoxine, a pyridoxine antagonist. It was then eradicated by treatment with pyridoxine, suggesting that the condition might be an indication of human pyridoxine deprivation. Patients with ordinary seborrhoeic dermatitis, not experimentally induced, were then treated with large doses of pyridoxine both orally and by injection but without change in the lesions. However, when the pyridoxine was administered topically, in an ointment, the areas of seborrhoeic dermatitis cleared within a period of three weeks and reappeared shortly after therapy was stopped. Control areas were not improved.

The studies indicated that the skin converted pyridoxine *in situ* to a metabolically active substance, and, in a broader sense, the studies suggested also the interesting concept that disease may on occasion be caused by a local, probably conditioned deficiency state.

It was suggested that common baldness might be influenced by certain constituents in sebum, an oil secreted by human skin. This theory evolved from the observation several years before that a group of workers engaged in the synthetic rubber industry became temporarily bald. The hair fall was subsequently traced to a group of chemicals classed as intermediary polymers or dimers, and one of them, choloroprene, not only affected loss of hair in experimental animals but also affected the hair follicles and the sulfhydryl group of chemicals, which are normally present in hairs. It was postulated then that similar changes might be the result of naturally occurring chemical compounds and it was observed that one called squalene, a constituent of human sebum, when applied to the skin of experimental laboratory animals actually did cause depilation which was localized to the site of application and reversible. The mode of action had not been determined at the close of 1951, but the suggestion was made that squalene or a related unsaturated compound present in sebum might be a factor that exerted important influence on baldness.

A new form of penicillin, penicillin 92, was introduced with evidence to indicate that it had an antibacterial spectrum *in vitro* similar to that of procaine penicillin G, the form of penicillin usually administered; it also possessed highly desirable hypoallergenic properties. It was found in a comparative study with other antibiotics on 100 patients to be excellent for topical use against ordinary bacterial infections of the skin.

Two enzymes, hyaluronidase and streptokinase-streptodornase, were recommended for the treatment of chronic cutaneous ulcers. The former, a naturally occurring enzyme which is important in the control of viscosity of tissues, promoted rapid healing when applied to leg ulcers of many years' duration in three cases which had resisted all orthodox methods of treatment. The latter, a preparation of proteolytic enzymes elaborated by group C streptococci, employed as a lytic agent for medical *débridement* to liquefy and dissolve purulent and fibrinous deposits, was used successfully for the treatment of infected burns, wounds, ulcers, abscesses and areas of necrosis.

At last a significant amount of statistical evidence was presented to demonstrate that X-ray therapy, as it is usually employed by dermatologists for the treatment of benign skin diseases, does not cause cancer or increase the tendency to skin cancer. The conclusion was based on a study of 2,000 patients. A control group of 1,000 patients, who had never received X-ray therapy, was studied against 1,000 who had been treated with X-rays for from 5 to 23 years previously.

Thirty-four per cent of a group of 35 patients with xanthelasma, small yellow patches on the eyelids, showed clinical evidence of concomitant cardiovascular disease and 47% showed an increased amount of cholesterol in the blood serum. The blood serum exhibited also lipoprotein complexes of a large type characteristically found in such pathological conditions as diabetes, hypothyroidism and atherosclerosis. Because of these findings it was suggested that xanthelasma might be considered the herald patch of coronary disease.

A number of new dermatological entities were added to the list of diseases affected favourably by treatment with ACTH and cortisone during 1951. These were herpes gestationis, pretibial myxoedema, pityriasis rubra pilaris, erythema multiforme, sarcoid, acute irritant dermatitis and acute ringworm of the hands and feet.

Triethylene melamine and proteinamine, new agents for the treatment of cancer, were reported to be successful in effecting improvement in diseases such as certain leukemias, Hodgkin's disease (lymphosarcoma) and other lymphoblastomas. The action of triethylene melamine, administered by mouth, was similar to that of nitrogen mustard but it produced much less nausea, vomiting and central nervous system stimulation. Proteinamine (methyl-bis-betachloroethylamine) effected remissions in addition in two cases each of acute lupus erythematosus and polyarteritis. Results from proteinamine in 59 cases were as good as those obtained from treatment with nitrogen mustard, but proteinamine had certain advantages: practically no nausea or vomiting, it reduced blood system toxicity; it was tolerated by children; and it was used on ambulatory patients.

Quotane for topical administration and pronestyl for oral use were both recommended for the relief of itching. Quotane, an amino ether derivative of isoquinoline chemically unrelated to any of the popular "caine"-type local anaesthetics, was found to be more effective and safer than the latter compounds. Though it had been used for urologic instrumentation for some time, its use in dermatology was new. The first results indicated it to be no panacea but effective for the relief of itching.

Pronestyl, an amide of procaine used for cardiac arrhythmias, was also found to be effective as an antipruritic agent. It was found to be stable in the body, and the results from its use were encouraging. (*See* also MEDICINE.) (H. RA.)

Detergents: *see* CHEMISTRY.

Detroit. Detroit, Mich., one of the oldest cities in the United States, marked in 1951 the 250th anniversary of its French founding with a summer-long program of pageantry and civic celebrations, including dedication of the Detroit Historical museum.

As fifth-ranking city in the United States, Detroit had a population of 1,849,568 by the 1950 federal census and an area of 137.9 sq.mi. The urbanized area of which Detroit is a part had a population of 2,644,476.

Regarded primarily as an automotive centre, Detroit industry nevertheless ranges from steel to pharmaceuticals. During 1951 about half of its production workers were employed in other than automotive plants.

Detroit is the hub of the southeastern Michigan industrial complex, and the county seat of Wayne county. It is stituated on the Detroit river directly opposite Windsor, Ont., which, through a configuration of the international border, lies south of Detroit.

The river carries a substantial part of Detroit's commerce, especially automobile shipments and raw materials for manufactures. Ocean vessels dock at its wharves.

The municipal government is nonpartisan, and the nine-man common council is elected at large. As a result of the Nov. 1951 city election, the terms for the principal public offices were extended from two to four years.

Criminal cases originating in Detroit are tried before municipal courts, but are prosecuted by the county attorney. Civil issues are heard before county courts.

Public transportation is municipally owned but not tax-supported. It consists of buses, streetcars and trackless trolleys. On April 21, 1951, the system's operating personnel went on a strike which lasted for almost two months, said to have been the longest transportation strike in the annals of major American cities. Commerce and industry remained unimpaired.

The city was making rapid progress with an extensive river front development, including a civic centre, and with the construction of a system of depressed vehicular expressways. Also building was a city-county skyscraper to house public offices and certain courts. The Detroit Symphony orchestra was re-established in 1951.

Principal municipal financial statistics for the fiscal year which began June 30, 1951, were: assessed value, $4,196,857,-170; gross bonded debt (including notes), $287,748,221; net bonded debt (including notes), $171,613,516; net tax-supported debt, $181,426,000; gross appropriations (including school, library and utilities), $339,917,708; tax levy (including school and library), $138,626,559; tax rate per $1,000 valuation (including school and library), $33.04. (R. Ho.)

De Valera, Eamon (1882–), Irish statesman, was born in New York city on Oct. 14. (For his early career see *Encyclopædia Britannica.*) He was *taoiseach* (prime minister) and minister for external affairs from Dec. 1937 to Feb. 1948, and had been president of the assembly of the League of Nations in 1938. During World War II he kept Ireland to a policy of strict neutrality, though when Belfast in Northern Ireland was heavily blitzed, he at once ordered the Dublin fire brigade to its aid with every available engine.

After the Feb. 1948 elections, when De Valera's Fianna Fáil was returned as the strongest party but with a minority of the seats in the *dail,* John Costello was elected *taoiseach.* De Valera left in March for the United States where he spoke in favour of a united Ireland and was made an honorary citizen of New York city. In the following months he visited India and Australia, and in October opened a campaign in Great Britain for the ending of partition.

The Costello coalition broke up early in 1951 after a dispute with the Roman Catholic hierarchy over a health scheme for mothers and children. In the elections that followed in May, Fianna Fáil improved its position slightly, and in June De Valera again became *taoiseach* by 74 votes to 69. (R. Jan.)

Devaluation: *see* Exchange Control and Exchange Rates.

Dewey, Thomas Edmund (1902–), U.S. governor, was born on March 24 in Owosso, Mich. He was graduated from the University of Michigan, Ann Arbor, in 1923, and received his law degree from Columbia university in 1925. He began to practise law and joined the New York Republican organization. In 1931 he was appointed chief assistant to the U.S. attorney for southern New York, and in 1935 special prosecutor to investigate gambling and other rackets in the state. He was elected district attorney in 1937, and campaigned for governor of New York in 1938 but was defeated. He was elected governor of New York in 1942 and re-elected in 1946 and 1950. In 1944 Dewey was nominated Republican candidate for president, but was defeated by Franklin D. Roosevelt. Again Republican candidate in 1948, he lost the election to Pres. Harry S. Truman in what was termed one of the greatest political upsets in U.S. history.

Dewey generally supported the bipartisan foreign policy, and in Feb. 1951 he testified before the joint session of the senate foreign relations and armed services committees that he believed there should be no limit to the number of U.S. troops that could be sent overseas. He termed the dismissal of General of the Army Douglas MacArthur "the culmination of disastrous failure of leadership in Washington." He later toured Japan, Korea and the Philippines and on his return declared that the Communists must not be permitted to take southeast Asia. He said he would oppose any move to make him a presidential candidate in 1952.

Diabetes. The increase in death rates from diabetes in the United States from 1900 onward slackened by 1930 and almost came to a halt in 1940. This occurred despite the advancing average age at death of the population, from 35.2 to 59.2 years between 1900 and 1949. The crude rate in 1940 was 26.6 per 100,000 and in 1948, the last year of statistics based on the fifth revision of the census, 26.4. The age adjusted rates following a peak in 1940 showed a declining rate, although the actual difference in the last 15 years was small. The declining rates held for each age group up to age 60, but showed little change subsequently. With the sixth revision of the census in 1949, using the doctor's opinion as to chief cause of death, the rate was 16.9. The halt in incidence could be explained by earlier recognition and better treatment of all cases, both mild and severe, so that at death diabetes was overlooked as a cause.

Evidences that control of diabetes is possible accumulated: (1) The Quarter Century Victory medal had by the close of 1951 been awarded to 29 diabetics, who after having proved diabetes for 25 years were free from complications. These patients had undergone meticulous control during their early years. (2) Among 200 children, reported by Priscilla White, those who were nearly free from coma for more than 20 years exhibited few or no complications in the arteries and eyes, in contrast to a high incidence when coma, indicating poor control, was frequent. (3) Among 202 patients, whose diabetes began later (ages 15 to 30 years) and had lasted 10 to 29 years, Howard F. Root, Richard H. Sinden and Ralph Zanca found those with poor control had far more advanced arteriosclerosis, retinal and kidney lesions than those under better control. (4) Among 247 patients with onset of diabetes between infancy and 30 years of age, and in existence for 10 to 34 years, a clear relationship was evident between the various degrees of control of diabetes and the development of calcified vessels, retinitis and albuminuria. No patients with excellent or good control showed advanced calcification, retinitis or nephropathy. Among 103 cases with diabetes for more than 20 years under poor or only fair control, diabetic nephropathy developed in 62 patients.

Removal of 95% of the pancreas of rats produced no diabetes at first, but in two months incipient diabetes appeared lasting into the third or fourth month; thereafter manifest diabetes occurred with all its symptoms and signs. The slow onset of diabetes in such animals made them ideal subjects for learning what influences the development of diabetes or increases its severity and afforded opportunity for curative treatment at different stages. In these animals the frequency was higher in males, explained by the protective action of the ovaries and the provocative action of the testes. Removal of the testes diminished the incidence and of the ovaries increased it. Female hormones eventually attenuated or suppressed the diabetes, whereas male hormones caused an earlier appearance and increased its incidence and severity by producing hypertrophy of the islets of Langerhans. Estrogens and substances that increased the SH group in the tissues (cysteine, thiouracils) were the principal substances that prevented the appearance of diabetes in these rats.

F. G. Young produced diabetes in adult dogs and cats by injections of anterior pituitary extract, but in puppies and kittens these same extracts or pure crystalline growth hormone exerted instead a growth-promoting effect and no diabetes, proving a single agent stimulated growth in the immature young but development of diabetes in the old. However, some puppies, persistently injected for long periods, when they became adults and ceased to grow, developed diabetes. The rat even when old responds to the anterior pituitary extract by growing and never becomes diabetic. Maintenance of lactation in the cow parallels its diabetogenic activity in the dog. Growth and diabetes induced by growth hormone represent an alternative effect of the same general metabolic stimulus. Young supported this thesis by metabolic balances which showed increased deposition of protein and increased oxidation of fat. Glucose oxidation was inhibited. A level of pituitary activity appropriate for growth or lactation might exist, but with no physiological outlet available, diabetes could result. Before the onset of their diabetes some women gave a history of having had exceptionally large babies. Was this the result of excessive activity of the maternal pituitary which led later to the development of diabetes in the mother?

Priscilla White observed excessively rapid growth in some diabetic children preceding diabetes.

The extractable insulin of the pancreas was measured by Gerald A. Wrenshall at autopsy in diabetic and nondiabetic human subjects. In nondiabetic adults concentration of extractable insulin of the pancreas increased progressively with decreasing pancreas weight, those subjects with high concentrations being characteristically obese and having fatty yet small pancreases. The extractable insulin of the pancreas after death by coma was found to be very low and likewise low in diabetics whose diabetes was discovered during the growth period, but much higher in subjects who had reached full stature prior to onset.

Diamonds.

The increased diamond output of 1950 was about evenly divided between the two leading producers, Belgian Congo and the Union of South Africa.

Table I.—*World Production of Diamonds*

Diplomatic Services: *see* AMBASSADORS AND ENVOYS.

Dirksen, Everett McKinley

(1896–), U.S. senator, was born on Jan. 4 at Pekin, Ill. He studied at the University of Minnesota, Minneapolis, from 1913 to 1917 and served with the United States expeditionary forces during World War I. After the war he became engaged in several businesses and in 1932 was elected to the U.S. house of representatives on the Republican ticket from the 16th Illinois district. He was a member of the 73rd-80th congresses (1933–49) and while in Washington, D.C., completed his law studies and was admitted to the Illinois and District of Columbia bars. A forceful orator, he attracted attention in congress for his heated criticism of the New Deal; however, he generally supported Pres. Franklin D. Roosevelt's foreign policy after Sept. 1941. In the election of Nov. 7, 1950, Dirksen defeated Scott W. Lucas, Democratic majority leader, as senator from Illinois. On Jan. 12, 1951, Dirksen was appointed chairman of the senate Republican campaign committee. In the senate he frequently criticized U.S. involvement in the support or defense of foreign countries. He voted against universal military training and service (March 9), against sending four additional U.S. divisions to Europe (April 4), and in favour of reducing foreign economic aid funds by $500,000,000 (Aug. 31).

Disabled American Veterans: *see* VETERANS' ORGANIZATIONS.

DiSalle, Michael V. (1908–), U.S. government official, was born in New York, N.Y., on Jan. 6. He moved with his family to Toledo, O., where he attended school, and later studied law at Georgetown university, Washington, D.C.

DiSalle began practising law in Toledo, and in 1933 became assistant district counsel of the Home Owners Loan corporation. In 1937 and 1938 he served a term as representative in the Ohio legislature and in 1938 sought unsuccessfully to win a seat in the upper house. He was assistant city law director of Toledo, 1939–41. From 1942 he spent five terms as a member of the Toledo city council, acting as vice-mayor, 1944–47.

In 1945 he came to national attention as originator and first chairman of the Toledo Labor-Management Citizens committee, which brought about industrial peace in the strike-ridden city; under the name of the "Toledo plan," it was widely imitated by other cities. The city council of Toledo, under its city-manager form of government, elected him mayor in 1947 and he was re-elected in 1949.

In Nov. 1950 Pres. Harry S. Truman named him director of price stabilization, and on Dec. 12, 1950, he was sworn into office. The economic stabilization director, Eric A. Johnston, delegated price control authority to him on Jan. 24, 1951. DiSalle was admitted to practice before the U.S. supreme court on Dec. 11, 1951.

Disasters. During 1951 loss of life and property in disasters included the following:

Aviation

Jan. 10	Near Edwards Air Force base, California. All eight persons aboard a B-50 bomber lost their lives when the plane crashed.
Jan. 11	Near Seguin, Texas. A B-29 Superfortress crashed, killing six of the 11 crewmen.
Jan. 14	Philadelphia International airport. Seven persons were killed when a DC-4 transport plane crashed and burned on landing; 21 escaped largely through the heroism of Stewardess Mary Frances Housley who showed the way through the flames to safety, then herself died while trying to rescue a child.
Jan. 16	Near Edwall, Wash. Ten persons were killed when an airliner crashed in a snowstorm.
Jan. 27	Near Tarquinia, Italy. Fourteen persons were killed when a four-engined Italian transport plane crashed.
Jan. 28	Eastern Formosa. A four-engined British royal air force flying boat crashed, killing all 16 aboard.
Jan. 31	Between Reykjavik, Iceland, and Vestmanaeyja. An Iceland airways two-engined transport plane crashed in a blizzard, killing all 20 aboard.
Jan. 31	Near Victoria beach, Terceira Island, Azores. A Portuguese army plane crashed into the sea killing all 14 persons aboard.
March 2	Sioux City, Ia. Sixteen persons were killed, nine survived when a DC-3 crashed while landing in a snowstorm.
March 11	Hong Kong Island. A Thai Skymaster crashed on Parker mountain. All 24 aboard were killed, including 3 American crewmen.
March 23	Atlantic ocean. U.S. air force C-124 Globemaster with 53 aboard disappeared while en route across the Atlantic. Wreckage found March 28 indicated there were no survivors.
April 6	Santa Ynez mountains, Calif. Twenty-two died when a transport plane crashed on a 20-minute flight from Santa Maria to Santa Barbara.
April 8	Charleston, W.Va. A U.S. air force plane carrying 21 men as a funeral escort for an air officer crashed into a fog-shrouded hill, killing 19.
April 9	Off Hong Kong. A Siamese airways transport plane crashed killing all 16 aboard.
April 25	Key West, Fla. Forty-three persons died in the mid-air collision of a Cuban airliner and a U.S. navy twin-engined trainer plane.
April 27	Over central Oklahoma. The pilot of an F-51 fighter plane and 12 crewmen of a B-36 bomber were killed when the planes collided; four of the bomber crew parachuted to safety.
April 29	Fort Wayne, Ind. A transport plane crashed on its approach to the airport during a thunderstorm; all 11 aboard died.
May 6	Albuquerque, N.M. Twenty-three crewmen of a B-36 bomber died when the plane crashed and exploded on attempting to land during a sandstorm.
May 23	Near New Lisbon, Ind. A U.S. air force 200-passenger transport plane crashed and burned, killing seven of the 12 persons aboard.
June 3	Near New Boston, Tex. Ten military personnel were killed when a U.S. air force cargo plane crashed in a thunderstorm.
June 8	Near Richmond, Ind. Eight planes in a flight of F-84 Thunderjets crashed in an electrical storm; three pilots were killed. The planes were part of a flight of 71 en route from Dayton, O., to Selfridge Air Force base, Mich.
June 22	Near Sanoye, Liberia. A transport plane en route from South Africa to New York crashed in the jungle, killing all 40 persons aboard.
June 30	Rocky Mountain National park, Colo. Fifty persons aboard a trans-continental transport plane were killed when the craft struck a peak.
July 12	Near Aracaju, Brazil. Thirty-two persons died when a Brazilian transport plane, flying in low visibility, crashed into a hill.
July 21	Near Juneau, Alaska. A Canadian four-engined transport plane bound for Korea with a crew of seven and 31 passengers, mostly U.S. military men, disappeared with all aboard.
Aug. 6	Puget Sound, Wash. Nine men died when a four-engined U.S. navy patrol plane plunged into the water.
Aug. 13	Seattle, Wash. A four-engined U.S. air force B-50 bomber went out of control, shortly after taking off from Boeing field, and smashed through a three-story apartment house, killing 11 and possibly 12 persons, and injuring 12 others.
Aug. 20	Fort Dix, N.J. Two U.S. air force officers and 11 infantrymen were killed when a two-seater jet training fighter plane plunged into a bivouac area; 23 other soldiers were injured.
Aug. 24	Near Oakland, Calif. Fifty persons aboard a commercial DC-6B luxury transport plane were killed when the craft crashed near the airport and burned.
Aug. 31	Tanaga Island, Alaska. Nine persons died and one survivor was found injured after a U.S. navy patrol bomber crashed; this was reported to be the 11th aircraft wrecked or missing in Alaska in six weeks, and the total number dead or missing was disclosed to be 87 persons.
Sept. 4	Off Montauk Point, L.I., N.Y. Seven U.S. navy fliers plunged to their deaths when their patrol bomber went out of control and struck the sea while on air-sea manoeuvres.
Sept. 4	Mountain Home, Idaho. A U.S. air force B-29 bomber on a routine training flight crashed and exploded on taking off, killing all seven aboard.
Oct. 15	North Atlantic Ocean. A U.S.A.F. transport with 11 aboard was lost at sea.
Oct. 17	Near Nanaimo, British Columbia. A flying-boat transport crashed, killing 23 persons.
Oct. 27	Near Flores, Guatemala. Twenty-seven Guatemalan fliers and entertainers were killed when a Guatemalan army plane crashed in the jungle.
Nov. 13	Mt. Dore, France. Thirty-six U.S. soldiers, airmen, wives and children were killed when a U.S.A.F. Flying Boxcar used as a hospital plane crashed on a flight from Frankfurt to Bordeaux.
Nov. 21	Calcutta, India. An Indian air liner crashed at the airport, killing 16.
Nov. 27	Off San Diego, Calif. A U.S. navy flying boat went down with 11 aboard. All perished.
Dec. 3	Near Lowry Air Force base, Denver, Colo. A U.S.A.F. B-29 bomber, trying to make an emergency landing, crashed into five houses, killing eight of the 14 persons aboard and injuring an occupant of one of the houses.
Dec. 6	Off the Azores. A B-29 bomber with 16 persons aboard crashed, killing all hands.
Dec. 6	Near Marseille, France. A U.S.A.F. C-47 transport plane crashed, killing 10.
Dec. 16	Elizabeth, N.J. A nonscheduled plane carrying 56 persons en route from Newark to Florida crashed after an engine caught fire; all aboard died.
Dec. 22	Near Tehran, Iran. An Egyptian air transport crashed, killing the crew of five and 15 passengers, among them Henry G. Bennett, chief of the U.S. Point Four program for overseas aid.
Dec. 29	Salamanca, N.Y. A nonscheduled transport plane crashed in overcast weather on a flight from Pittsburgh to Buffalo; 26 died; 14 survived.
Dec. 30	Near Phoenix, Arizona. A U.S.A.F. C-47 transport plane crashed and brought death to 28 aboard, of whom 19 were West Point cadets on Christmas vacations.

Fires and Explosions

Jan. 3	Near Chimbote, Peru. A delayed dynamite blast set off an Andes avalanche that killed at least 132 railway workers.
Jan. 18	Near Kermit, W. Va. Eleven miners were killed and two were injured in an explosion in a coal mine.
Jan. 30	Hoquiam, Wash. Fire that swept through a rest home killed 20 elderly persons.
May 13	Kaho, northern Nigeria. More than 317 persons died in a fire that destroyed a movie theatre.
May 17	Nha Trang, Indochina. Fifty-five French troops died and 130 were injured when a French LST was ripped by an explosion and fire.
May 19	Kushiro, Hokkaido, Japan. Thirty-five children and three adults were burned to death when flames from ignited motion picture film spread throughout a movie house.
May 29	Easington, England. An explosion in a coal mine killed 83 miners and a rescue worker.
May 31	Hamm, Germany. An explosion 3,000 feet underground in a coal mine killed 14 miners, and injured 20 others.
June 3	Hikone, Japan. Fire that began when motion picture film caught fire killed 23 girl silk-factory workers, most of whom died in a crush at the exits.
June 15	Montreal, Quebec. Thirty-five persons, most of them aged women, died when flames swept through the Hospice of Sainte Cunegonde, a shelter for aged and orphans.
July 5	Berlin, Germany. An excursion boat overcrowded with school children bound for a Communist-sponsored outing exploded and burned; about 30 persons, mostly children, died.
July 7	Haifnen-la-Bassée, Nord, France. Seventeen persons were killed, three others were missing, and 13 additional workmen were hospitalized as the result of an explosion in a munitions plant.

RESCUE WORK amid the wreckage of the Pennsylvania railroad's packed commuter train which plunged from an overpass at Woodbridge, N.J., in Feb. 1951 and took the lives of 85 persons

July 7 Newark, N.J. Seventy tanks of propane gas exploded, hurling flaming debris over a wide area of the Port Newark region, and causing damage estimated at more than $5,000,000. Eleven persons were injured.

July 11 Thuringia, East Germany. The second mine disaster within a week was announced by the east German cabinet, which said 7 miners were killed and 28 injured in the blast; it was simultaneously reported that in the first accident a week earlier nine miners had died.

July 12 Indianapolis, Ind. Seven men were killed and another critically injured in an explosion at a jet-engine test plant.

July 22 San Francisco, Calif. Eight persons died and 10 others were injured in a fire that routed 100 persons from an apartment building.

Aug. 20 Near Singapore. Two explosions, followed by fire aboard the tanker "Dromus," killed 22 men, injured 30 others and left 2 more men missing and presumed dead.

Sept. 8 Oshima, Japan. Eleven miners were killed and four others were injured in a coal mine explosion.

Sept. 16 Mexico City, Fourteen persons died in a flash fire that swept through a night club.

Sept. 17 Wood River, Ill. Explosion in an oil refinery brought death to 13.

Oct. 15 Near Morgantown, W.Va. Gas explosions in a coal mine were blamed for the deaths of 10 miners.

Oct. 31 Kayford, W. Va. Twelve persons died in a coal mine explosion.

Nov. 23 Copenhagen, Denmark. Fire and explosion wrecked the Holmen station of the Royal Danish navy and killed 17 persons.

Dec. 11 Near Summerville, S.C. Fire in a lumber worker's home killed nine persons, of whom seven were children.

Dec. 21 Near West Frankfort, Ill. A gas explosion killed 119 miners in the worst mine explosion in the U.S. in 23 years.

Dec. 22 Tijuana, Mexico. Forty-one persons were killed in a fire at a children's holiday party.

Marine

Jan. 31 Belfast, Northern Ireland. Sixteen workers were killed when a gangway collapsed between the dock and the ship "Juan Perón."

April 16 English channel, off the Isle of Alderney. The British submarine "Affray" sank on a dive with 75 persons aboard. All perished.

April 20 Gulf of Mexico, off Morgan City, La. Two tankers collided in a dense fog, and in resultant fires a total of 40 crewmen of the vessels were killed.

May 14 Off Cape Henry, Va. Thirty-six lives were lost in a collision between the U.S. navy seaplane tender "Valcour" and the collier "Thomas Tracy."

May 25 Newport, R.I. Nineteen U.S. navy personnel drowned when a crowded launch capsized in Newport harbour during a storm.

June 10 Long Island sound, off Plum Island, Conn. Eleven persons drowned in the sinking of a charter boat.

June 16 Off Cedros Island, Pacific coast of Mexico. A cannery fishing boat with 37 persons aboard capsized in high seas, and 23 aboard were lost.

July 5 Mississippi river, above New Orleans, La. Five crewmen were drowned and four were injured aboard a towboat that sank after a collision with a tanker.

July 29 Lake Caron, near Edmunston, N.B. Five persons were drowned when a hand-operated cable ferry capsized.

Aug. 12 The North sea between England and Denmark. The Norwegian freighter "Bess" capsized, shortly after it was abandoned in heavy seas; nine survivors were picked up, two bodies were recovered and 20 other persons were reported missing and presumed lost.

Sept. 1 Off Montauk Point, L.I., N.Y. The captain and 45 passengers aboard the fishing boat "Pelican" were drowned, while 19 were saved, when the boat capsized in heavy seas after suffering engine failure on a holiday fishing cruise.

Oct. 5 Off Cape Hatteras, N.C. Seventeen persons died and six were rescued when a U.S. ore ship broke in two.

Nov. 6 Off the Pacific Northwest coast of the U.S. The U.S. freighter "George Walton" was lost at sea; six crewmen were unaccounted for.

Nov. 28 Boston harbour. Fifteen seamen were killed in a collision between a trawler and a tanker.

Miscellaneous

Sept. 16 Campinos, Braz. The roof of a motion-picture house collapsed, killing 28 children.

Oct. 28 Atlanta, Ga. Moonshine liquor made of wood alcohol killed 36 persons and hospitalized more than 200; two men were held on charges of murder; 12 on lesser charges.

Natural

Jan. 3 French Morocco. Floods that swept the Rharb plain area of Morocco left 71 persons known dead and 60 missing.

Jan. 4 Comoro Island, between Madagascar and Africa. A two-day tornado left an estimated 500 persons dead.

Jan. 18-21 Mount Lamington, near Port Moresby, New Guinea. An estimated 4,000 Papuan natives and 34 Europeans were reported killed when this volcanic mountain erupted in a series of explosions that destroyed 20 villages.

Jan. 19-24 The Alps of Switzerland, Italy, Austria and France. Avalanches precipitated by record snowfalls killed about 300 persons in this period.

Jan. 31-Feb. 9 United States. An estimated 200 persons died in a nationwide cold wave that brought new record lows to parts of the north and northwest.

May 6-7 El Salvador. Earthquakes killed at least 375, leaving 25,000 homeless, with the greatest losses occurring in the cities of Jucuapa and Chinameca.

May 12 Faridpur district, East Bengal, Pakistan. A total of 200 persons were reported killed or injured in a tornado.

June 15-July 1 New Mexico, Arizona, California, Oregon, Washington, British Columbia. Thousands of acres of forests were destroyed by fires.

July 1 Kyushu, Japan. At least 13 persons were killed and widespread property damage was inflicted by a typhoon that struck Japan's southernmost island.

July 7-8 Wisconsin and neighbouring states. Winds of hurricane force swept across six midwest states, causing property damage of more than $1,000,000 and leaving at least six persons dead.

July 12-14 Western Japan. Floods caused the deaths of nearly 100 persons, while leaving more than 200 injured and 200 missing.

July 11-25 Kansas, Oklahoma, Missouri and Illinois. In the most disastrous flood in the history of the U.S. the Missouri river and its tributaries, swollen by unseasonable rains, roared through a succession of cities. Property damage was given at more than $870,000,000.

	Nearly 200,000 persons fled their homes. About one million acres of fertile farmlands were covered with muck and debris. The number of dead was believed to be about 40.
Aug. 3	Potosi, northwest of Managua, Nicaragua. Earthquakes split the sides of a dormant volcano, sending water from its crater down to inundate this coastal port, which was reported virtually destroyed with heavy casualties among its population of 1,000.
Aug. 1-22	Central Texas. At least 44 persons died in a prolonged heat wave that also caused heavy damage to crops.
Aug. 13	Changra, Turkey. Earthquakes that centered in northern Turkey caused a reported 54 deaths and injuries to 150 persons.
Aug. 15-25	Caribbean and Gulf of Mexico areas, from Jamaica to Mexico. A prolonged hurricane swept from Jamaica across the Yucatan peninsula and into Tampico, Mexico, killing a total of 260 persons. Scores more were injured or missing, and damage was estimated at between a half-billion and a billion dollars. Among the deaths in Mexico were many caused by floods from storm-swollen rivers, including 42 persons who were drowned when a dam crumbled at Cardenas.
Aug. 20	Manchuria. Floods were reported by the Mukden radio to have killed 1,800 persons, while 3,000 others were still missing. The radio reported the floods had occurred two weeks earlier and had washed out the main rail line between Mukden and Dairen.
Aug. 24	Wondervu, Colorado. Lightning set off 10 or 12 cases of dynamite being used on a construction project for a dam and tunnel; nine workmen were killed and nine others were injured.
Sept. 26-27	Pescadores Islands and Formosa. More than 100 died in a typhoon.
Sept. 26	Wisconsin, Illinois and Michigan. Storms and tornadoes killed 12 persons.
Oct. 4	Southern Japan. After a typhoon, 448 persons were reported dead.
Nov. 14	Iran. Floods near the Caspian sea were reported to have demolished the village of Roodsar, leaving about 225 dead or missing.
Nov. 1-20	Po River valley, Italy. Three weeks of storms and floods left a reported 150 persons dead and about 150,000 homeless.
Dec. 4-13	Camiguin Island, Philippine Islands. Repeated eruptions of a volcano killed at least 248 persons, left about 500 missing, and about 20,000 homeless.
Dec. 10-13	Central Philippines. Reports indicated that as many as 724 persons were dead in typhoons.
Dec. 25	Epi Island, New Hebrides. Hurricane killed a reported 100 persons.

Railway

Feb. 6	Woodbridge, N.J. Eighty-five persons were killed and about 500 were injured in the third most disastrous rail wreck in the history of the U.S., when a commuter train was derailed at a temporary overpass.
April 24	Yokohama, Japan. A broken power line fell on the roof of a train, and in ensuing fires 104 persons, including three U.S. soldiers, were burned to death; 66 others were injured.
May 18	Bryn Mawr, Pa. Eight persons died and 63 were injured when a railroad flier crashed into the rear of a passenger train that was halted by an automatic signal.
June 8	Near Rio de Janeiro, Brazil. 54 persons were killed when a train struck a stalled gas truck near Nova Iguacu, 20 mi. from Rio de Janeiro. It was Brazil's worst railway disaster.
Aug. 10	Near Simmesport, La. Eleven persons were killed and at least 60 others were injured when a troop train collided head-on with a passenger streamliner.
Aug. 24	Near Metz, France. Twenty-one persons, including six Americans, were killed and more than 30 persons were injured when a Basel-Calais train rammed into the rear of a Frankfort-Paris train standing outside Sary-sur-Nied station ten miles east of Metz.
Nov. 12	Near Evanston, Wyo. Two transcontinental passenger trains collided in a snowstorm, killing at least 16 and injuring many more.
Nov. 25	Near Woodstock, Ala. Sixteen persons were killed and 70 were hurt when two passenger trains collided head-on.
Dec. 17	Near Carneiro, Ceara state, Brazil. Fifty-three were killed when a train jumped the rails.

Traffic

Dec. 29-Jan. 1	United States. Traffic deaths over the New Year's holiday totalled 304.
April 29	Weirton, W.Va. Ten persons were killed and 51 injured when a crowded bus went out of control on a mile-long hill and crashed into a concrete wall.
Aug. 13	Near Bolzano, Italy. Thirty-four persons on a holiday excursion aboard a bus were drowned when the vehicle plunged into a lake.
Sept. 1-3	United States. A new record for holiday traffic deaths was established when 461 persons were killed in highway accidents over the Labor day holiday.
Nov. 21-23	United States. Traffic accidents over the Thanksgiving holiday throughout the U.S. brought death to a reported 135 persons.
Dec. 4	Chatham, England. Twenty-three boys were killed when their Royal Marine cadet formation was struck by a suburban bus.
Dec. 28	United States. Traffic deaths over the Christmas holidays throughout the U.S. were set at a reported 555.

Disciples of Christ.

In 1951 the total membership of this movement for Christian unity in the United States and Canada was 1,802,157, and in the world, 1,945,607; there were 7,914 churches in the United States and Canada, and 8,738 congregations in the world. The international convention, usually held annually, was by-passed in 1951. In its place 17 area assemblies were held, with a total registration of 17,581. These were held in representative centres for a three-day period. More than 200 speakers participated in the 17 programs, using the theme "The Assurance of Things Hoped For." These assemblies were the occasions of launching a ten-year long-range program for the Disciples of Christ with specific objectives as follows: 500,000 new members; 4,450 new ministers; 1,830,000 new pupils in the church school; doubled giving for all causes within the ten-year period; the establishment of 200 churches; and the recruitment, training and commissioning of 250 new missionaries.

The Disciples of Christ participated in the formation of the National Council of the Churches of Christ in the U.S.A., with personnel serving on the divisions of Christian life and work, foreign missions, home missions and Christian education.

At the close of the year there were 210 missionaries and 2,393 nationals serving in 12 mission fields. The United Christian Missionary society, a board of missions and education, located in Indianapolis, Ind., is the major administrative office for missions, Christian education and church development.

Headquarters: 516 K. of P. building, Indianapolis, Ind.; Marvin O. Sansbury, president; Gaines M. Cook, executive secretary; Gertrude Dimke, recording secretary; H. B. Holloway, business manager. (*See* also CHURCH MEMBERSHIP.)

Dominican Republic.

The eastern two-thirds of the mountainous island of Hispaniola is the Dominican Republic, with an area of 19,129 sq.mi. The population is predominantly Afro-American. Population (census of Aug. 6, 1951) 2,121,000; that of the capital, Ciudad Trujillo (known until recently as Santo Domingo, whence the name of the nation), 181,000 (with 241,000 in the national district) and that of the four leading provincial cities, Santiago de los Caballeros, 56,000; San Pedro de Macorís, 16,000; San Felipe de Puerta Plata, 14,000; and Barahona, 14,000. The president in 1951 was Gen. Rafael Leónidas Trujillo y Molina.

History.—The sugar production of the Dominican Republic in 1951 was the greatest on record—nearly 530,000 metric tons. All of it was sold to Great Britain, the normal market for Dominican sugar, at prices above those of 1950. As in recent years, the entire coffee crop was sold early. British purchases of Dominican products were again substantially greater in value than those of the United States. The Dominican government took the occasion of the coming into effect on June 6 of the tariff changes agreed to at Torquay, Eng., to emphasize all the concessions made to the United States and to stress the merit of a modest increase in the Dominican quota in the U.S. sugar market. The turnover of goods in domestic trade continued to slow down, as in 1950, but unemployment did not increase. The price level and wage level did not change perceptibly. The government continued to build up its cash resources, but established no increases in tax rates.

The seizure on July 26 of a Guatemalan vessel, en route from Cuba to Guatemala, by a Dominican naval vessel gave rise to renewed recriminations between the Dominican Republic, which imprisoned the crew and passengers as enemy elements, and Cuba and Guatemala. The Guatemalans were released, but the Cubans were sentenced to 20 years' imprisonment. Nevertheless, on Christmas day, 1951, President Trujillo released the Cubans also, and lessened the tension with Cuba.

Relations with Haiti were more cordial than for some years. (C. Me.)

Education.—In June 1951 there were 2,749 schools (including 1,208 emergency schools), all of which were maintained by the state except 107 semiofficial (state-aided) and 95 private schools. The total number of pupils was 262,499. The University of Santo Domingo had 2,254 students and 172 faculty members. The 1951 budget allocated $4,629,398 for education. The 74 motion-picture theatres had seating capacity of 30,963.

Finance.—The monetary unit is the peso, officially pegged at par with the U.S. dollar. Revenue in 1950 totalled $96,590,000, expenditure $90,881,000. The 1951 budget totalled $74,606,200. The internal debt amounted to $21,261,000 on June 30, 1951; there was no external debt. Notes in circulation on Sept. 30, 1951, totalled 29,510,000 pesos; gold reserve $8,100,000; checking deposits in commercial banks 50,780,000 pesos (including government deposits); time deposits 12,820,000 pesos. The cost-of-living index at Ciudad Trujillo stood at 250 in Sept. 1951 (1941 = 100).

Trade and Communications.—Exports in the year 1950 were valued at $83,500,000; imports were $43,000,000. Leading exports were sugar (47%), cacao (17%), coffee (15%) and tobacco (6%). Leading customers were the U.S. (44%) and the United Kingdom (42%); leading suppliers, the U.S. (73%), the Netherlands Antilles (5%), the United Kingdom (2%) and Germany (2%).

There were 170 mi. of public railway, all owned and operated by the government, and about 650 mi. of industrial railway, operated mainly by the sugar companies. In 1949 the mileage of surfaced highway was about 500; that of all roads was about 3,000. Motor vehicles in 1948 included 3,124 automobiles and 2,390 trucks.

Agriculture.—In the 1950–51 season, a record total of 587,343 short tons of sugar and 25,813,275 gal. of blackstrap molasses was produced. In the period Jan. 1–Sept. 30, 1951, 496,209 short tons of sugar and 16,392,557 gal. of molasses were exported. Other important crops were coffee (1950–51: 326,899 bags of 132 lb. each), cacao (1950–51: 34,000 short tons), tobacco (1949–50: 24,200 short tons) and bananas (1949–50: 5,237,168 stems). In 1950 there were 1,140,000 pigs, 340,000 goats, (1949) 602,000 cattle, 140,000 horses and 126,000 mules and asses.

Manufactures.—On Dec. 31, 1947, there were more than 4,200 industrial establishments representing a total investment of $98,000,000, of which the sugar industry accounted for more than two-thirds. Important manufacturing enterprises in 1951 included 16 sugar mills, a large chocolate plant, an industrial alcohol plant, 2 cotton textile mills, 2 breweries and a cement plant. (J. W. Mw.)

DANNY KAYE (left), Vivien Leigh and Sir Laurence Olivier singing at the Palladium in London during a 1951 benefit performance for the family of Sid Field, British comedian who died the previous year

Donaldson, Jesse M. (1885–), U.S. postmaster general, was born on Aug. 17 near Shelbyville, Ill., and attended school at Oconee, Ill., and at Shelbyville. He began teaching school in the vicinity, and eventually left his teaching position to accept a post as letter carrier in 1908. He held in succeeding years various positions of increasing importance in the postal service, becoming, by 1945, first assistant postmaster general. He became postmaster general in 1947, the first post-office career man to attain this position.

Under his administration in 1951 an investigation was launched into the "sale" of postal jobs in Mississippi, as a result of which the post office dismissed or filed charges against 56 employees. In October the congress passed legislation to raise postal rates by about $117,000,000 a year and to institute postal pay increases amounting to about $250,000,000 a year.

Donations and Bequests. Philanthropy in the United States apparently reached a record high in dollar volume in 1951. While official statistics of contributions recorded in income tax returns had not been published at the close of the year, preliminary estimates indicated that total philanthropy in the country in 1951 was in excess of $4,250,000,000. The estimated total of philanthropy in 1950 was $4,110,000,000. The latest official figures were for 1948, when the tax returns showed contributions by individuals and corporations estimated at $3,742,483,000.

Publicly announced giving in ten major cities, compiled by John Price Jones Company, Inc., showed contributions 21% greater in 1951 than in 1950 and an increase of 29% in bequests. These increases, however, represented philanthropy in metropolitan areas and were probably higher than the average for the nation.

Rising costs in philanthropic institutions and organizations continued to cause serious concern, and were not wholly offset by increased giving. This concern increased as new taxes, enacted late in 1951, took effect and there was conjecture as to whether increased taxation would lessen total giving.

John Price Jones Company, Inc., questioned 175 persons throughout the United States, all of whom had public records as practising philanthropists, or were acknowledged leaders in the philanthropic field. Seventy-two per cent of these persons believed higher taxes would not adversely affect giving, while 28% expected some decline because of higher taxes. There was a fairly unanimous opinion among those questioned that giving by corporations for philanthropy would increase with more complete advantage taken of tax deductions allowable for contributions.

Such records as were available at the close of the year indicated that corporate giving in 1951 was greater than ever before and probably was in excess of $500,000,000. In 1948 income tax figures showed corporate giving as $239,337,000.

With continued prosperity in 1952 there was every reason to expect the generosity of the American people to hold up to its established level. As competition for the philanthropic dollar became greater, however, philanthropic causes most likely to flourish were those which could present a sound and rational case. The day of easy emotional giving was believed by many to have passed. (J. P. J.)

Great Britain.—The National Thanksgiving fund, launched by the lord mayor of London on March 21, 1950, in gratitude for food gifts from the commonwealth and the United States, was officially closed in July 1951. Sir Denys Lowson, lord mayor of London, announced that of the original target of £2,000,000 only £800,000 had been raised. The following first allocations were made from the fund: £600,000 for halls of residence for women and married students and U.S. men students; £100,000 to London house for maintenance; and £35,000 to the Burn, the parallel establishment in Scotland to London house. These allocations enabled the original purposes of the fund to be carried out.

After the loss on April 16, 1951, of the submarine "Affray," the mayors of Chatham, Rochester and Gillingham launched a relief fund which amounted to £177,492 by December. Eton College launched a building appeal for £1,000,000; by the middle of

November £390,000 had been raised. In August an appeal for £150,000 was launched to endow a chair of commonwealth studies at Cambridge university as a permanent memorial to Jan Christiaan Smuts.

The Nathan committee on charitable trusts, set up in Jan. 1950, continued to receive evidence during 1951; the creation of the committee was welcomed in the sixth report of the Nuffield foundation, published in June 1951. In August the vice-chancellor of the University of Cambridge announced that the trust had granted £37,000 to the university. At the same time a grant of $82,500 was announced from the Rockefeller foundation. The Carnegie United Kingdom trust had granted £4,065,555 since its creation in 1913. Of this sum more than £1,500,000 had been expended on library services. The Pilgrim trust, in its 20th annual report issued in May, forecast "a somewhat less liberal grant policy." In 1950 the trust had made grants of £143,823. (*See* also COMMUNITY CHEST; SOCIETIES AND ASSOCIATIONS, U.S.)

Douglas, Paul Howard

(1892–), U.S. economist and senator, was born on March 26 in Salem, Mass., and spent his boyhood on a farm in Maine. He worked at a variety of jobs to put himself through Bowdoin college, Brunswick, Me., where he was graduated in 1913. He did graduate work at Columbia and Harvard universities and began teaching at the University of Illinois, Urbana. He was a labour disputes arbitrator for the Emergency Fleet corporation in 1918 and 1919, and in the latter year he returned to teaching, successively at the University of Washington, Seattle, and at The University of Chicago. He wrote books on economic theory and served on a number of boards and commissions dealing with such subjects as unemployment, utility rates, old age pensions and labour-management relations.

Douglas was an alderman of the city of Chicago from 1939 until 1942, when he enlisted as a private in the U.S. marine corps. He was wounded and spent 14 months in hospitals, leaving the service as a lieutenant colonel. In 1948 he was elected U.S. senator from Illinois.

In 1951 Douglas was chairman of a senate labour subcommittee investigating ethics in government which helped uncover irregularities in federal offices. Douglas opposed Pres. Harry S. Truman's nominations for two federal judgeships in Illinois, and on Oct. 9, 1951, the senate supported Douglas by rejecting the president's appointments.

Drew, George Alexander

(1894–), Canadian political leader, was born on May 7 at Guelph, Ont., and educated at Guelph Collegiate institute, Upper Canada college and the University of Toronto.

He became leader of the Ontario Conservative party in 1938, member of the Ontario legislature in 1939 and premier of Ontario and minister of education in 1943. In the 1948 Ontario election, although his government won 53 of the 90 seats, he was personally defeated and entered federal politics. On Oct. 2, 1948, he was chosen leader of the national Progressive Conservative party, and was elected to parliament on Dec. 20 of that year. In the June 27, 1949, general election Drew retained his seat in Carleton. As leader of the opposition in parliament, he was the government's chief critic, and repeatedly urged strict parliamentary control of government costs, increased efficiency in government services and substantial reduction of nondefense expenditures. He took the stand that Canada was bound to honour its commitments to the United Nations and under the North Atlantic Treaty organization, but he expressed dissatisfaction with Canada's preparedness. During 1951 Drew's program included emergency price controls, higher pensions for veterans, increased industrial production, encouragement of housing and faster immigration. Fortified by five federal by-election victories, he was vigorous in the house of commons, and succeeded in getting the government to create a special committee to examine all defense expenditures. (C. Cy.)

Drug Administration, U.S.

The Food and Drug administration of the Federal Security agency directed 75% of the criminal actions alleging drug violations in the 1951 fiscal year against illegal sellers of prescription drugs. These cases were based on aggravated abuses —sales of dangerous drugs without a doctor's prescription or refills of prescriptions without the physician's authorization. Leads to these violators often came from police officers and social workers or from the families of barbiturate addicts. Drugs involved in the 1951 illegal sales cases included not only habit-forming barbiturates, but also amphetamines, sulfonamides, penicillin and potent hormones too dangerous for use without medical supervision.

Congress recognized the regulatory problems caused by the fringe operators, whose indifference to the public health reflects on the pharmacy profession as a whole, and amended the Federal Food, Drug, and Cosmetic act on Oct. 26, 1951, to provide more direct and effective control of prescription sales and refills.

Manufacturing controls in drug plants had shown gradual improvement—there were fewer recalls and seizures of drugs failing to meet labelled standards. In 1951, 10 dangerous drugs were recalled from the market because of manufacturing errors, faulty controls or unusual reactions in patients, in contrast to 17 in 1950 and 33 in 1949.

In proprietary remedy cases, the courts were especially critical of untrained persons who prepared and promoted medicines represented as cures for serious diseases. Two were sentenced to prison and others warned to stay out of the drug business. Cure-alls, promoted by unprincipled or ignorant operators, still hoodwinked the unwary, the gullible and the incurable who from desperation grasped for any promised benefit. Two promoters of worthless "cures" for cancer and other serious diseases were enjoined.

Therapeutic devices seized included clinical thermometers that did not meet the standards, as well as various types of electrical apparatus, misleadingly labelled as weight reducers or cures for disease. Apart from the vicious claims many made for the treatment of serious diseases, some of the seized devices were dangerous in themselves, including an X-ray machine being used to remove superfluous hair by beauty shop operators without training in the X-ray field, heating pads without thermostatic controls and a device intended for massage of the prostate.

A statistical breakdown of the Food and Drug administration's enforcement activities for the year indicates that 26.5% of enforcement time was devoted to drugs and devices produced within the U.S.; 1,954 drug factory inspections were made; and 5,418 samples were collected. Drug and device seizures numbered 209, and 102 criminal prosecutions were brought in the federal courts for alleged violations.

During the fiscal year, 538 new-drug applications were received and 427 were permitted to become effective, including 171 for veterinary products. No application was formally revoked or refused. The criterion for approval is safety, when used as directed by the labelling. Therapeutic claims of efficacy are subject only to the general drug-provisions of the law, applicable after the new drug is marketed. Many of the applications involved combinations of antihistamines with other drugs; others were a blood plasma extender, a number of ACTH and cortisone products, a synthetic morphine substitute, preparations of the antibiotic drugs neomycin and polymixin B, a number of curare-like drugs and some new anticoagulants.

Predistribution testing and certification is required of certain drugs and of coal-tar colours which cannot be controlled adequately under usual regulatory procedures. The Food and Drug administration certified 296 batches of drugs composed wholly or partly of insulin and 17,391 batches of antibiotics, including penicillin, streptomycin, aureomycin, bacitracin and chloramphenicol. The administration certified 4,466 batches of coal-tar colours for use in foods, drugs and cosmetics. (*See* also FEDERAL SECURITY AGENCY; NARCOTICS AND NARCOTIC TRAFFIC.)

Duff, James Henderson

(1883–), U.S. senator, was born on Jan. 21 at Mansfield (later renamed Carnegie), Pa. He took his bachelor's degree at Princeton university in 1904 and his law degree from the University of Pittsburgh in 1907. He practised law in Pittsburgh from 1907 to 1943 and as early as 1912 became active in Republican politics. In Jan. 1943 he became attorney general of Pennsylvania and in 1946 was elected governor of the state. On Nov. 7, 1950, he was elected U.S. senator from Pennsylvania despite the powerful opposition of Joseph R. Grundy, Republican political boss of the state, defeating the senate Democratic whip, Francis J. Myers.

Generally identified with the liberal Republican group in congress, Duff in 1951 supported the sending of additional U.S. troops to Europe and upheld Pres. Harry S. Truman's dismissal of Gen. Douglas MacArthur. On Sept. 18 he voted (with eight others) to sustain President Truman's veto of a bill granting veterans pensions for nonservice disabilities. During the year he was also active in promoting the presidential candidacy of Gen. Dwight D. Eisenhower.

Duke Endowment: *see* SOCIETIES AND ASSOCIATION, U.S.

Dulles, John Foster

(1888–), U.S. attorney and international law expert, was born Feb. 25 in Washington, D.C., graduated from Princeton university, Princeton, N.J., in 1908 and was awarded a law degree at the George Washington university law school in 1911. As a specialist in international law he assisted the U.S. state department in Panamá, where he arranged for that republic's war declaration in 1917. In World War I he served as a major on the army general staff, and after that war went to the Paris peace conference as U.S. counsel on reparations and other financial matters. He drafted several of the treaty clauses. Between the two wars he became a prominent international lawyer. After a trip to Europe in 1937 he underwent, by his own account, a "spiritual change," and became convinced of the need for a Christian ethical basis to win a lasting peace. He became chairman of the Federal Council of Churches Commission on Just and Durable Peace. He was a member of the U.S. delegation to the 1945 conference to organize the United Nations at San Francisco, Calif., and was high in U.S. councils at many postwar international conferences.

In 1951, as U.S. ambassador-at-large, he travelled to both Asia and Europe to arrange for agreement among the World War II allies, the U.S.S.R. excepted, to a peace treaty with Japan. For these measures he was repeatedly denounced by high soviet officials, but he won general support for the treaty terms, and it was signed in San Francisco on Sept. 8 by Japan and 48 non-Communist nations, with Dulles one of the members of the U.S. delegation. He was also, on May 12, 1951, re-elected chairman of the Carnegie Endowment for International Peace.

Dyestuffs.

The volume of production and sales of U.S. dyestuffs in 1951 maintained essentially the same high level established during the preceding year. The needs of the civilian economy were generally fulfilled with some minor exceptions. Through technological advances in dyeing and finishing and the increased use of vat and other fast colours, the quality of dyed merchandise was better than ever before. The industry continued its policy of close co-operation with the armed services; defense requirements accounted for 80% of the consumption of such vat colours as khaki, brown and olive. Increases in the costs of raw materials and labour were not reflected in the prices of dyes, most of which remained at the 1950 parity. Despite aggressive competition from foreign dye exporting countries, credit restrictions and other economic and political factors, the U.S. industry held approximately the same volume supplied to export markets in 1950.

Several new synthetic fibres possessing unusual characteristics were introduced commercially. They could be used alone or combined with those of natural origin to form unique fabric constructions. These new fibres and their resultant blends imposed numerous technical difficulties of coloration which were largely overcome through the combined knowledge of the textile and chemical industries.

Production of U.S. dyes in 1950 was 195,713,000 lb., an increase of 40% or 56,324,000 lb. over 1949. The output in 1950, however, was 8% less than the record production of 212,000,000 lb. in 1947. In 1950 sales of all dyes amounted to 188,382,000 lb. valued at $190,786,000, compared with 136,244,000 lb. valued at $142,513,000 in 1949, an increase of 38% in quantity and 34% in value. The average unit value of sales of all dyes declined to $1.01 per pound from $1.05 in 1949, largely because of increased production of a number of cheaper dyes. The vat colour group continued to hold the top position in both production and sales accounting for 34.9% of the 1950 total, an increase of 2.8% over 1949. Direct dyes represented 21%, sulphur dyes 12% and acid dyes 11%.

Production of anthraquinone vat dyes increased 32%, azo dyes 28%, indigoid dyes 89% and sulphur dyes 37% over the 1949 figures. The greatest increases in terms of quantity were for synthetic indigo, 95% higher, and sulphur black, up 44%—both low-priced dyes—while only relatively few dyes showed a decline in production compared with 1949 figures.

Sales of vat dyes exclusive of indigo amounted to $51,409,000, direct dyes $43,563,000, acid dyes $22,940,000 and sulphur dyes $7,628,000, the latter being exceeded in total value by the acetate, azoic and basic dyes. Production and sales figures for 1951 were not available at the end of the year.

The United States bureau of customs indicated an increase in dye imports from $2,200,000 in 1949 to $4,100,000 in 1950 (foreign value). Switzerland supplied 73% of the total quantity imported, Germany 19% and the United Kingdom 8%.

(A. G. Br.)

Europe.—French, Swiss and German technical organizations held a meeting in 1951 to consider international agreement on methods of testing colour fastness and expressing the results; delegates from 14 countries attended. Nine countries assented to proposals put forward at the final session but others, including Great Britain, reserved a decision. The British observers called attention to the fact that the International Standards organization was already studying the problem. A subcommittee on colour fastness had been set up when the textile committee of the organization met in England in 1949. Later, the committee held another meeting and consideration was again given to colour fastness. Considerable progress was made and agreement in principle was reached on about a dozen tests.

Like many other British industries the dyestuff industry was threatened by the sulphur shortage in the earlier part of the year. But the cuts in United States exports proved less drastic than had been feared and certain economies in the use of sulphur were effected. Nevertheless, the sulphur situation and tightness in the supplies of various coal-tar chemicals made trading in dyestuffs during much of 1951 more difficult than it had been.

A court of appeal in Paris, Fr., ordered the restoration to the former owners of that part of the shareholding of Francolor, the French dyestuffs combine, which had been held by I. G. Farbenindustrie, the German dyestuffs combine, during World War II and subsequently sequestrated by the French government. Following the Paris court order a new company, Cie. Française des Matières Colorantes, was formed to take over the management of the assets of Francolor.

The Allied High commission in Germany issued its final plan for the splitting up of the former I. G. Farbenindustrie. There were to be three large groups, together with a number of smaller ones producing a variety of goods including dyes. Considerable interest was taken in the introduction in Germany of new members of the important copperphthalocyanine group of colours.

(L. E. Ms.)

Ear, Nose and Throat, Diseases of.

The Common Cold and Antihistamines.—It was suggested by Edmund P. Fowler, Jr., in 1951 that colds involve overaction of either the sympathetic or the parasympathetic nervous system of the nose. Since histamine or histaminelike substances are involved in the autonomic balance, antihistamines sometimes interfere in its action enough to produce symptomatic relief. First, they produce on the peripheral vessels an effect of a stimulant, like epinephrine, and perhaps secondarily they act as a paralyzing agent, like procaine or atropine. At any rate, they apparently ameliorate the effects of histamine in the allergic type of cold. It also seemed possible that the antihistamines must have some effect on secondary processes developing after physical or psychic stimuli which tend to predispose to the infectious type of cold in some people.

Observations indicated that a specific hypersensitivity and imbalance of the involuntary nervous system is fundamental in the allergic type of cold. Histamine or histaminelike substances appear to contribute to the symptomatology. The allergic individual is, apparently, the constitutional type in whom there is a comparatively reduced functioning of the sympathetic response from his autonomic nervous system with overaction of the parasympathetic response. This may result either from lack of adequate opposition or from sensitization to parasympathetic stimuli. Either could be influenced by antihistamines, which were shown to have adrenergic (sympatheticomimetic) as well as atropinelike properties.

Whether one could assume that the person who develops the infectious cold does so from overaction of the sympathetic side of his autonomic nervous system was not clear. The theory was presented that when and if the antihistamines have an effect on the infectious cold they block secondary parasympathetic tissue responses in the psychic or physical stimuli stages of certain colds and so produce symptomatic relief. They may also reduce the action of histamine as it is released by infection in the early invasion stages of a mild cold.

The adrenergic action of antihistamines may tend to make the later stages of a cold worse. Whether there is also eventual destruction of the cilia and changes in the cells of the mucous membranes, as with ephedrine and other nose drops, had not been proved by the close of 1951, nor was increased permeability of the epithelium to bacteria and to viruses; but these were not unreasonable expectations. Laboratory experiments indicated that therapeutic doses of the common antihistamines would not be of value in well-developed infectious colds. They might give some help in the early stages of the infectious cold or such colds in which an allergic factor is present. If it be assumed that from 10% to 30% of all so-called "colds" may have a strong allergic or vasomotor component in which antihistaminic drugs would be expected to be beneficial, it must be concluded that antihistaminic agents do not cure the majority of cases of the common cold.

Lipoid Pneumonia.—A survey of 389 chronically ill patients by Bruno W. Volk and his associates, reported in 1951, revealed 57 cases (14.6%) of lipoid pneumonia diagnosed by microscopic examination of the sputum, aspiration from the lung and roentgenologic studies of the chest. Most of the patients used mineral oil as a laxative. Others had used nose drops of various oil-containing medications. The sputum of 55 patients showed lipophages or abundant amounts of free lipoid material characteristic of lipoid pneumonia. Aspiration from the lung also revealed typical lipoid-containing macrophages. Twenty patients showed characteristic roentgenographic manifestations of lipoid pneumonia. Thirteen revealed retrocardiac changes consistent with oil aspiration pneumonia in lateral, oblique and, when indicated, overexposed film studies, although the posteroanterior films did not show such lesions. A significant number of patients had a productive cough and positive physical signs, most frequently observed over the base of the right lower lobe. The fact that the disease progressed after discontinuance of the incitant oily factors was possibly the result of reaspiration of disintegrated lipophages.

The diagnosis of lipoid pneumonia depends upon eliciting the history of prolonged oil ingestion, together with the demonstration of oil in the sputum. For the purpose of identifying the oil in the sputum, three samples are obtained before breakfast. The application of lens paper or cigarette paper to the surface of the expectorated material often reveals the telltale oil drops. Failing this, the oil can be demonstrated by microscopic examination of the sputum, the oil droplets staining characteristically with scarlet red or Sudan III.

The course of lipoid pneumonia is variable, but it should be remembered that a paraffin tumour resembles other tumours, particularly if it occurs on one side only. While the presence of fat in the sputum should not mitigate against an exploratory operation in questionable cases, the demonstration of fat in the sputum in conjunction with a history of prolonged ingestion of oily substances suggests the possibility of lipoid pneumonia as an explanation of a unilateral infiltration in the lung.

Psychological Preparation for Tonsillectomy.—According to Abraham Z. Barhash, all children have a great deal of anxiety about being in hospitals. The failure of physicians to instruct their patients is especially true in the performance of tonsillectomies in children. If one considers the damage that tonsillectomies have brought about by traumatizing children emotionally and causing them to have future states of tension and unhappiness by making them feel less whole and less able to care for themselves in a hostile world, and by making them less able to derive full benefit from the ministrations of the physician, then the tonsillectomy looms as a potentially serious procedure.

As a first requirement in the prevention of such effects, Barhash believes that the physician ought to be honest with the child, and that he should be informative rather than secretive. Depending on the age and the level of understanding of the child, the child should be told what is wrong, what the anatomical facts are, what is going to be removed, how it is going to be removed and what the effects will be. If possible, the patient should be introduced to the scene before the actual operation. When he is taken from his mother, it should be by one with whom he is acquainted rather than by a total stranger. One of the parents should be with the child to the point where he is anaesthetized, and also immediately on awakening. Above all, the physician should avoid anything that encourages fear and confusion.

Maintenance of the Airway-Tracheotomy.—When a patient becomes too ill to expel secretions from his throat and lungs, tracheotomy should be done without delay. Drainage is thereby made more effective than with a nasal catheter, and the larynx is not injured. Life is often saved, and even in hopeless cases the airway is cleared and bronchopneumonia is prevented. Roy W. Dickman and Ivan D. Baronofsky operated at the first indication of respiratory obstruction. The trachea was opened by them in 14 surgical cases involving such grave conditions as severe head injury, chest wounds with fractured ribs, haemothorax or tension pneumothorax, third-degree burn from inhalation of hot fumes, ruptured ulcer with peritonitis and separation of an esophageal suture after the resection for carcinoma.

If secretions collect and air flow is reduced, mucus rapidly becomes more viscid, clogging the cilia and dulling the cough reflex. As more air is cut off, cyanosis, cerebral anoxia and stupor develop, still further deadening the response to bronchial irritation.

The unconscious patient, originally free of pulmonary symptoms, is too often suffocated by the sticky mucoid accumulation. If the subject is stuporous, a nasal catheter drainage requires a laryngologist rather than a nurse, and the procedure may be necessary every 30 minutes for several days. The larynx is inevitably damaged as a result.

Even in the deepest coma, a catheter inserted through the tracheotomy tube arouses a vigorous cough reflex which empties the small bronchi and bronchioles. Both air and sputum are passed more easily than through the larynx and the patient's respiratory efforts are much reduced.

Artificial drainage should be started when obstruction is severe enough to cause cyanosis, rapid pulse and tachypnoea. The breathing may be deceptively loud, since air sometimes enters the pharynx, larynx and upper trachea freely when the bronchioles and alveoli are blocked with mucus. However, auscultation of the chest will reveal poor breath sounds and bronchial rales.

Large amounts of tenacious sputum are sometimes removed, and suction may be continued for almost 20 minutes at a time. This may be carried out by experienced nursing personnel. Obstructive symptoms immediately subside, complications seldom develop and the wound heals two to seven days after withdrawal of the tube.

Economics.

The Korean war began to take on the appearance of a stalemate during 1951 with some prospects of a cease fire and armistice by the end of the year. Back of this conflict was a persistently touchy and potentially explosive situation as between the United States and the U.S.S.R., each nation flanked by a sizable group of allies. To complicate matters Great Britain ran afoul of serious economic and political difficulties in the middle east at about midyear.

The problem of economic mobilization forced all other issues into low priority positions on the agenda of both governmental officials and economists. Serious rearmament was initiated in 1950 out of a situation closely approximating full employment and continued to encounter the resistance of established high standards of consumption. While the price upswing characterized by scare buying in the latter half of 1950 had perceptibly abated by the middle of 1951 it left its trail in price and wage distortions which presaged a continuing although slower upward movement. A prospectively unbalanced federal budget at least until mid-1953, in spite of a tax program designed to raise an unprecedented $60,000,000,000 to $70,000,000,000 per year, made this appear all the more certain. The gross national product reached a $328,000,000,000 annual rate, also unprecedented, at the end of the year and seemed destined to climb to close to $345,000,000,000 in 1952. Economists in the United States and, as a matter of fact, throughout the western world, were concerned during 1951 with the closely related problems of mobilization, inflation and fiscal policy.

There was, however, another group of equally pertinent issues. United States dependence on and commitments to the North Atlantic Treaty organization joined with British difficulties in the middle east to force attention on the problems of international trade, international investment and aid both to allies and undeveloped countries.

At the annual December meeting of the American Economic association in Boston, Mass., more than half the papers were related directly or indirectly to one or the other of these two groups of topics: mobilization-inflation-fiscal and trade-aid-international. Papers with a purely theoretical orientation were few in number. This problem emphasis had characterized both academic and scientific economics for at least a decade.

Aggregative income-flow analysis continued to hold dominant sway over the textbooks. Those containing the elaborate traditional models or even newer ideas on price theory were subject to severe criticism at the hands of reviewers. Oligopoly and olygopsony, separately or in combination, seemed to be about the only ones of the customary price patterns worthy of further attention. In the minds of many, even these more realistic types of analysis had their sure and conclusive justification only in their ability to contribute to existing knowledge of the pattern of monetary flow. Locational theory and the study of technological change assumed a somewhat more prominent place in the science during the year. (G. J. C.)

Economic Stabilization Agency: *see* DEFENSE MOBILIZATION AGENCIES, U.S.

Ecuador. A republic on the west coast of South America, straddling the equator, after which it was named. Ecuador is bounded on the north and east by Colombia, on the east and south by Peru and on the west by the Pacific ocean. It has an area of 104,510 sq.mi. (including the Galápagos Islands, a dependency of 3,029 sq.mi.) and a population of (preliminary figures, 1950 census of the Americas) 3,076,933. About 60% of this figure represents Indians, 30% mestizos, 9% "whites" and 1% Negroes. Quito (pop., 1947 census, 200,185) is the capital; other major cities (with pop. est.) are Guayaquil, the main port (235,000); Cuenca (53,520); Riobamba (28,500); Jipijapa (23,000); Vinces (22,350); Chone (22,280); Ambato (22,300); Loja (21,560); and Latacunga (21,750). The predominant religion is Roman Catholicism. President in 1951: Galo Plaza Lasso.

History.—President Plaza's term was to expire in 1952, and political activity during 1951 in part reflected attempts of the political parties to prepare for the election of his successor. In midyear the Socialist party announced the formal termination of its opposition to the Plaza administration, paving the way for a broadened anticonservative coalition likely to emerge for the 1952 elections. Following the Socialists' action, President Plaza reorganized his cabinet to include in it two Socialists, one Radical Liberal, one member of his own National Civic Democratic movement and four independents.

In May Pres. Harry S. Truman invited President Plaza to visit the United States, which he did from June 20 to 30. While he was in Washington, Plaza received assurances of additional U.S. aid in repairing the damage done by the disastrous earthquake of 1949, and also was given a pledge of more Point Four assistance for his country. In New York city, Plaza addressed the United Nations general assembly. On the way back to Ecuador, he stopped off in Mexico and in Venezuela.

Ecuador's century-old border dispute with Peru was reopened in August when the Quito government charged that. between Aug. 8 and 15, Peruvian forces launched ten small attacks against the Ecuadorian border province of Santiago-Zamora. The charges were denied at Lima, and the matter was referred to the U.S., Argentina, Brazil and Chile, the four states which had mediated the 1941 Peru-Ecuador border war. A mediation conference was called for Aug. 29; when that parley opened at Rio de Janeiro, Braz., the frontier skirmishes had ceased and no further action was deemed necessary. (G. I. B.)

Education.—In the school year 1949–50 there were 2,544 government primary schools with 225,571 pupils, 390 municipal schools with 34,222 pupils and 357 private schools (mostly Roman Catholic) with 61,138 pupils. There were 73 government secondary schools with 16,999 pupils, 11 municipal schools with 2,515 pupils and 72 private schools with 7,882 pupils. Institutions of higher learning included four public universities with 4,512 students, the Catholic university of Quito (164) and the polytechnical school (58).

Finance.—The monetary unit is the sucre, valued at $0.0660 U.S. currency, official rate, and $0.0571, free rate, on Nov. 26, 1951. The budget for 1952 balanced ordinary revenue and expenditure at 465,000,000 sucres (1951: 470,000,000 sucres). Total revenue in 1950 (ordinary and extraordinary; excluding autonomous entities) was 679,594,000 sucres; expenditure, 669,849,000 sucres. The foreign debt in June 1951 was $42,634,000; internal, 141,937,000 sucres. Notes in circulation on Sept. 30, 1951, totalled 453,000,000 sucres; gold reserves $22,400,000; commercial banking deposits 440,000,000 sucres; time deposits 125,000,000 sucres; government deposits 96,000,000 sucres.

Trade and Communications.—Exports in 1950 (Ecuadorian ports only) totalled $63,300,000 (excluding gold); imports through the port of Guayaquil, $42,300,000. Chief exports were coffee (30%), cacao (29%), rice (13%) and bananas (12%). Leading customers were the U.S. (55%), Italy (8%), Peru (8%), Colombia (5%) and Germany (4%). The leading suppliers were the U.S. (67%), Belgium (7%), the United Kingdom (6%), Germany (5%) and Sweden (3%).

The length of the nine nationalized railroad lines in operation in 1949 was 698 mi. Highways (1947) included 1,591 mi. of main roads and 1,121 mi. of branch roads. In 1948 there were 2,921 automobiles, 4,245 trucks and 945 buses. Radios in use on Jan. 1, 1951, were estimated at 45,000.

Agriculture.—Production of the principal export crops in the 1950–51 crop year included cacao 30,707 short tons; coffee 210,000 bags of 132 lb. each and rice (paddy) 149,000 short tons. Exports in 1950 were coffee 341,917 bags; cacao 29,598 short tons; rice 71,051 short tons and bananas, about 8,695,000 stems. There were 1,600,000 cattle and 1,800,000 sheep in 1949. Forest exports in 1950 included tagua nuts 11,216 short tons and balsa and other unmanufactured woods 5,216 short tons.

Manufactures.—The most important manufacturing activity was the textile industry, which produced cotton (principally), silk, woollen and rayon textiles. The manufacture of *toquilla* (Panamá) hats was also important. Cement production in 1950 was 63,516 short tons.

Mineral Production.—Production in 1950 included gold 83,071 fine ounces (excluding placer production); silver 273,200 fine ounces; copper 1,160,000 lbs. and lead 496,000 lbs. Production of petroleum, concentrated on the Santa Elena peninsula in Guayas province, was 2,632,266 bbl. (J. W. Mw.)

Education. The major events in education in the United States during 1951 were (1) the persistent shortages in school facilities, materials and teachers; (2) the rising school population and the costs of school construction and maintenance; (3) the declining student enrolments and budgets in the colleges and universities; (4) the static situation regarding federal aid to public education; (5) the creation of the Ford foundation's funds for the advancement of education and for adult education, with respective initial grants of $7,154,000 and $3,000,000; (6) the scandals in higher education involving cheating on tests by cadets of the United States Military academy and the acceptance of bribes by college basketball players; (7) the passing of the Universal Military Training and Service act amendments granting temporary deferment to certain high school and college students whose work is satisfactory; (8) the rather slow progress in breaking down the barriers of racial segregation in higher education in the south; (9) the record enrolment of more than 30.000 students from other countries in the colleges and universities; (10) the successful repudiation by faculty personnel at Ohio State university, Columbus, of most of the restrictions imposed upon visiting speakers; (11) the abrogation by the regents of the University of California of the anti-Communist oath; and (12) the vigorous counterattack by U.S. educators and laymen against the extreme critics of public education.

Statistics.—The office of education of the Federal Security agency estimated in September that the total enrolment in public and private schools was as follows: elementary schools, 24,468,000; high schools, 6,168,000; colleges 2,225,000; grand total 33,121,000, marking an increase of about 420,000 over the previous year. There were rises in enrolment in elementary and secondary education, but a decline in higher education. The office of education announced that the 1951 figure was the highest ever attained.

In November the office of education reported the findings of its fourth annual national survey of attendance in colleges and universities. The revised over-all figure was 2,116,000 for 1,806 institutions, a drop of 10.8% in male students and of 1.3% in female students below the registration of 1950. The number of male freshmen decreased by 12.1%, while that of women freshmen dropped by 3%. The general percentage of decrease for the year was 7.8. The number of veteran students declined by 32.1%. The type of institution which suffered the greatest drop in enrolment was the teachers' college, which had 170,034 students as compared with 190,745 in 1950, a loss of 10.9%. The freshman students in the teachers' colleges numbered only

44,081, a decrease of 15.9%.

The 32nd annual census of college enrolments by Raymond Walters, president of the University of Cincinnati, showed that there were 1,275,404 full-time and 489,133 part-time students, 1,764,537 in all, in 818 approved institutions of higher learning. In contrast to 1950, there was a full-time reduction of 11.4%; a part-time increase of 4.6%; and a general decrease of 7.8%, a figure which coincided with that of the office of education (*School and Society* [Dec. 22, 1951]). (*See* also Veterans Administration [U.S.].)

Federal Participation in Education.—As he had done in earlier years, Pres. Harry S. Truman requested congress in January to pass immediate legislation providing federal aid to public education. However, very little action was taken by congress during the year to make practical his recommendations. On Feb. 22 (legislative day, Jan. 29) Sen. James E. Murray of Montana and Sen. Brien McMahon of Connecticut introduced S. 947, Educational Finance Act of 1951, which authorized the annual appropriation of $300,000,000 to the several states for the reduction of the inequality of educational opportunity in elementary and secondary education. This bill contained a special provision that federal funds could be used to transport pupils of private schools, including parochial schools, in all states where such payments are legally permissible. Still another provision attempted to ensure that states maintaining separate schools for minority races should apportion the funds justly and equitably to all schools. Several months later, on June 14, Rep. Graham A. Barden of North Carolina, chairman of the house committee on education and labour, introduced H.R. 4468, a bill which provided federal financial help to the states and territories to set up "an adequate minimum program of education" in an effort "to more nearly equalize educational opportunities in public elementary and secondary schools." According to this Public School Assistance Act of 1951, an annual sum of $314,000,000 was to be given toward the support of public, but not private, schools. In both cases, the bills were referred to the committees in the respective legislative chambers, but the year ended with no further congressional action.

An unusual event was the veto by President Truman early in November of H.R. 5411, a bill authorizing the government to construct, maintain and operate elementary and secondary schools in communities where federal defense activities were an excessive burden on school facilities. This bill was passed unanimously by both houses of congress, but it incurred the opposition of the president because of the presence of a clause which would perpetuate the segregation of the races in schools. Congress passed public law 51 during June. This law amended the Universal Military Training and Service act to allow high school and college students who are doing well scholastically to be deferred temporarily from military service. Other educational bills which were introduced in congress but which were not acted upon were S. 337, an attempt to set up an emergency five-year program of scholarships and grants for students of medicine, dentistry and allied professions; H.R. 910, a program of grants and scholarships to aid nursing education; S. 1452, an annual grant of $750,000 to the several states for the development and improvement of public library service in rural localities which lack any libraries or adequate library facilities; and H.R. 5215, an appropriation of $300,000 to the National Science foundation. The sum in the last-named bill was a reduction by 98% of the $14,000,000 requested by the foundation. Such action by the house of representatives led to a resolution in September by the American Chemical society that congress restore the full amount.

Elementary and Secondary Education.—After a six-month survey of conditions in the rural schools, the *New York Times* reported in March that the prevalence of inadequate courses of study, not fully qualified teachers and below-standard buildings and facilities resulted in the situation whereby one out of every four pupils in the rural schools was receiving "only a second-rate schooling." These conditions were in evidence, stressed the report, in spite of the fact that efforts had been expended in recent years to improve rural education. Also in March, the National Child Labor committee reported the results of a national survey which indicated that the rate of dropping out prior to graduation by high school boys and girls had increased. According to this study, pupils in 119 representative school systems in various parts of the country dropped out of school chiefly on account of tension and uncertainty over the draft, as well as of greater opportunities for employment. In June William Jansen, superintendent of schools in New York city, made the startling revelation that one out of every 200 pupils in the high schools under his supervision was a probable user of narcotic drugs. A possible clue to these unfortunate developments was evident in the report released in October by the Commission on Life Adjustment for Youth, a group sponsored by the office of education. On the basis of a study lasting three years, the commission concluded that the high schools did not furnish satisfactory training for the 60% of the high school boys and girls who did not plan to enrol in college or to take up a specific trade. In line with this finding, the commission suggested revisions in the curricula of the high schools in order to make the studies more responsive to the needs of boys and girls.

The use of television in education expanded during the year. When the schools of Minneapolis, Minn., were closed in January because of a strike by school janitors, pupils were taught by means of television at home. Snow and ice kept pupils in the vicinity of Memphis, Tenn., confined to their homes for several days, but lessons in arithmetic, biology and history went on through the co-operation of television station WMCT. The great popularity of television among youth was attested to by a study made by Paul Witty, professor of education at Northwestern university, Evanston, Ill., in which it was shown that high school pupils devoted a larger share of their time to watching television programs than to motion pictures, radio programs and the reading of books. Other interesting developments were the reports in October of bribery offers to high school football players in Connecticut and to basketball players in Kentucky, and the strike by pupils in four Catholic high schools in Pittsburgh in December as a protest against the discontinuance of football by the diocesan athletic committee.

Higher Education.—The knotty question of how to finance colleges and universities again came to the fore in 1951. Inflation and the decline in funds from tuition pointed to curtailment of curricula and reduction of teaching personnel. That no substantial crisis ensued was attributed to the increased appropriations by municipal and state legislatures, additional contributions by alumni and other citizens and grants by various foundations and other organizations. An important debate during the year concerned the acceleration of studies to make it possible for students to complete their degrees in three years, as was the practice during World War II. The Korean crisis did not prevent 55% of 205 colleges and universities from regarding acceleration as unnecessary and undesirable, according to the results of a survey reported in March by the American Council on Education. Another controversy dealt with the executive order by President Truman setting up a plan of draft deferment based on superior scholastic performance in college. The presidents of Harvard and Princeton universities looked upon this plan as undemocratic, while the heads of Columbia and Yale were more favourably disposed toward it. In the meantime, more than 175,000 students were given aptitude tests in mathematics, vocabulary and reading comprehension in order to determine whether they would be deferred from military service. The results of these examinations, released in October, indicated that 37% of the students tested failed to obtain the passing score of 70. Unless these students were in the upper levels of their classes, they would be inducted into the armed forces. In this way, the provisions of public law 51 granting temporary deferment to qualified students were being administered.

In the realm of curriculum, Harvard inaugurated its widely heralded general education program; Johns Hopkins university, Baltimore, Md., allowed qualified undergraduates to start graduate study without a bachelor's degree; and two Catholic institutions, Fordham university, New York city, and the University of San Francisco, San Francisco, Calif., introduced courses on communism. Foreign studies prospered as a result of the opening of the American Academy of Asiatic Studies in San Francisco, the Institute of War and Peace Studies at Columbia university, New York city, and the expansion of Russian and Asiatic studies at Columbia; Cornell university, Ithaca, N.Y.; Dartmouth college, Hanover, N.H.; and Michigan State college, East Lansing. On the level of professional education, Columbia co-operated with 12 liberal arts colleges to offer a combined five-year plan granting the B.A. and B.S. degrees to students continuing work in engineering at Columbia. Campaigns were organized to improve instruction in nursing, a profession which was experiencing an acute shortage of qualified practitioners. To provide adequate funds to train properly the record number of medical students—26,191 in 1950–51—the National Fund for Medical Education was established.

Among other events of interest to higher education in 1951 were the reports about the inadequate service rendered by the majority of college libraries; the availability of exceptionally well-paid positions to the 500,000 students who graduated in June; the termination of new educational benefits under the G.I. Bill of Rights, a program to which the government had already paid $12,600,000,000; the increase in graduate enrolment over that of 1950; the pact by five southern universities, operating under the regional educational program, to develop and improve on a co-operative basis their instruction in forestry; the use of colour television in the teaching of medicine at the University of Kansas, Lawrence; the publication of *God and Man at Yale* by William F. Buckley, Jr., an exposé of alleged secularist and leftist tendencies at that institution, which aroused discussion and debate in higher educational circles all over the nation; the enrolment of more than 30,000 students from other countries, mainly in the fields of engineering, liberal arts and social sciences, in 1,400 institutions, with Columbia university, the University of California and New York university having more than 1,000 students each; the commencement of a recruiting campaign in the colleges for personnel for the U.S. foreign service; the graduation in December of 93 men in the U.S. air force as competent Russian-language specialists after an intensive course of 11 months at Syracuse university; the completion of a study which revealed that the lack of qualified personnel had prevented the development of programs of social work all over the nation and that improvement in social work education was necessary; and the announcement in December, based on a survey by the office of education, that there were 125,000 scholarships totalling $27,000,000 for undergraduate students and 14,000 fellowships for graduate students valued at $9,500,000, or one grant for about 20 students in all types of colleges.

"DOES IT BOTHER YOU—" a cartoon by Manning of the McNaught Syndicate, Inc., published in 1951

The greatest amount of public attention was focused upon the revelations regarding the status of intercollegiate athletics. The authorities at the United States Military academy dismissed 90 cadets on the charge of having cheated in examinations. These students, according to the superintendent of the academy, composed a group of football players and their friends.

After widespread publicity to this affair both at home and abroad, many of the ousted cadets gained admittance to other colleges, with 21 having their expenses paid at the University of Notre Dame, Notre Dame, Ind., by an anonymous benefactor. Another national scandal, this time in basketball, affected seven colleges in the east and midwest. Basketball players of national repute were arrested for allegedly having accepted money to "fix" the results of intercollegiate games. As these facts were disclosed, a wave of criticism emanated from college and lay sources. Some institutions announced reforms in the administration of athletics, such as the removal of subsidies to athletes and greater stress on intramural than on extramural sports. In November the American Council on Education appointed a committee of ten college presidents to look into the abuses in the organization and administration of college athletic programs.

The Teacher Situation.—The annual survey of teacher supply and demand, conducted by Ray C. Maul, professor of education at the Kansas State Teachers college, Emporia, for the National Education association, reported that only 32,000 new elementary school teachers were available to meet the minimum of 80,000 vacancies.

Adult Education.—For the most part, the outstanding developments dealt with the use of radio broadcasts to keep the public informed about social conditions in areas under Communist domination, a phase in the propaganda war, and with the educational role of television. In January the National Association of Educational Broadcasters sent a complaint to the Federal Communications commission regarding the practice of television stations of devoting 10% of their time to adult crime plays, but no time for child care, economics, U.S. history and the fine arts. The chairman of the commission, Wayne Coy, announced the results of a survey that showed as many as 23.9% of television owners reading newspapers less often than prior to obtaining their sets. Interestingly, the *Statistical Yearbook* of the United Nations placed the U.S. in seventh place as a newspaper-reading nation. Throughout 1951 there was a debate about the allocation of television channels for educational uses.

Race and Religion.—While the pattern of racial segregation in southern institutions of higher education, by virtue of U.S. supreme court decisions in previous years, was slowly breaking down, there was ample evidence that there would be considerable resistance. Moreover, it was apparent that the struggle to retain segregated schools would be especially intense with regard to elementary and secondary education.

Early in January the U.S. supreme court ruled that Louisiana State university, Baton Rouge, must admit Roy S. Wilson, a qualified Negro student, to its law school. In October the same court ordered the university to permit Negro students to study in the school of nursing. The fact that the federal district court of Tennessee handed down a decision in April compelling the University of Tennessee, Knoxville, to admit Negroes to its professional schools did not remove the barrier of segregation; it was necessary for four Negro students to submit an appeal in December to the U.S. supreme court regarding their application for admission to the university. The University of North Carolina, Chapel Hill, announced in April that it would accept its first Negro medical student and in November, after some debate, it allowed Negroes to sit beside white students at varsity football games. However, the University of Georgia, Athens, did not allow a Negro student to enter the law school, while Florida State university, Tallahassee, refused to play a football game with Bradley university, Peoria, Ill., because of the presence of Negro players on the latter team.

The greatest opposition to the removal of segregation practices was manifest in Georgia and South Carolina. On Jan. 31 the speaker of the Georgia house of representatives introduced a constitutional amendment, reputedly originating with Gov. Herman Talmadge, to preserve segregation in spite of adverse court decisions by assigning all Georgia schools and the university system to private individuals. The following month the legislature passed an appropriation law which would withhold state funds from all common schools if a Negro should be admitted to a single white school and from the entire university system if a Negro should enter one unit. Late in May Negroes challenged the constitutionality of the practice of educational segregation in federal court, Clarendon county, S.C. Other court actions along similar lines took place in Wilmington, Del.; Topeka, Kan.; and Pensacola, Fla.

The office of education announced the presence of 74,526 students in Negro colleges during 1950, whereas in 1900 there were only 2,624 enrolled.

Unlike 1949 and 1950, there was no nation-wide controversy between Protestants and Catholics over the question of federal aid to parochial schools. However, there were disagreements in limited areas. Thus, in February, Catholic educators denounced a teacher training bulletin published by the board of education of New York city as "atheistic" and critical of Catholic philosophy and values. The New Mexico school board banned in March the wearing of religious habits by Catholic nuns and brothers teaching in the public schools. In Wisconsin, a Protestant parent brought suit in September against the practice of allowing nuns to teach in the public schools. The plan of releasing children one hour each week for religious instruction was declared constitutional in June by the New York state court of appeals, but protests continued for the rest of the year. An official body of Reform Jewish rabbis passed a resolution against released time instruction, a move which brought forth much criticism from the Catholic clergy. In December the U.S. supreme court agreed to review the constitutionality of this type of religious teaching. The custom of religious baccalaureate services was characterized as religious instruction and hence illegal in school buildings, according to a ruling by the New York state commissioner of education in June. As the year was drawing to a close, two controversies were going on: a protest by physicians, ministers and others against the decision by the New York state board of regents omitting all questions about the germ theory of disease from high school regents' tests as offensive to Christian Scientists; and support and condemnation of the regents' suggestion that each school day be started with a nonsectarian prayer.

Communism and Academic Freedom.—The dispute which strained relations between the faculty and the board of regents of the University of California over a period of two years was settled by two actions. In October the board voted to discontinue the anti-Communist oath requirement, and in November it defeated an attempt to reconsider the first vote.

What started out as a similar *cause célèbre* in academic freedom came to a speedier conclusion. In September the trustees of Ohio State university issued a regulation that all speakers invited to the campus must be screened on the basis of loyalty and background. This touched off a chain of protests by the faculty, professional organizations, the American Association of University Professors and church groups. The tenor of all this criticism, which also included resolutions by educational bodies not to meet at the university, was that this "gag rule" constituted an infringement upon academic freedom threatening the spirit of freedom in higher education everywhere. For their part, the trustees justified their action on the ground that numerous protests were received after the speech on the campus in July by Harold Rugg, whose textbooks in the social studies had been described as "socialistic." In spite of some concessions made in the regulation early in November by Pres. Howard L. Bevis, the protests continued. Shortly afterward, the council of the American Association of University Professors declared that the trustees' rule was "subversive of the functions of a free university in a free society" (the *New York Times* [Nov. 11, 1951]). One month later, the trustees voted unanimously to approve a revised set of regulations which had been developed by means of joint faculty-trustee conferences. Although the faculty as a whole regarded the new regulations as a victory, it was not entirely satisfied because some of the restrictions remained.

The case of the eight teachers in New York city who had been suspended in March 1950 for having refused to say whether they were Communists also reached a definite conclusion. Early in February the board of education unanimously upheld the findings of the special trial examiner, who had recommended at the end of the previous year that these teachers be dismissed. A similar unanimous vote was delivered by the board in December regarding the policy of dismissing teachers who were proved to be members of the Communist party or other subversive organizations. In this connection, it is interesting to note that the Communist party of New York state withdrew in September its appeal to the U.S. supreme court to test the constitutionality of the Feinberg law, which bars from public school positions any members of groups described by the New York state board of regents as subversive. Resolutions to prevent the appointment of teachers who support communism were adopted in December by the New York State Associations of Elementary and Secondary School Principals. Also in December the New York state board of regents announced that it would appoint a commission of three persons, including the state commissioner of education, to conduct an investigation to determine whether school texts contained any subversive material. Elsewhere, the Ohio supreme court upheld in November the requirement by the Cleveland board of education of an anti-Communist oath of prospective teachers.

Of particular interest to the problem of academic freedom was the result of a survey released in May by the *New York Times*. Here was an indication that the faculty and students of 72 representative colleges felt that free inquiry was being stifled by the fear of being branded with the label of "red" or "pink."

International Educational Relations.—The Institute of International Education reported in April that there were more than 30,000 students from other countries attending 1,400 U.S. colleges and universities during 1950–51, as compared with the 26,433 in attendance at 1,210 institutions during the previous academic year. The report also made note of the fact that public funds such as those available under the Fulbright and Smith-Mundt acts paid for all or part of the expenses of about 13% of these students; and that an important factor in the rise in such enrolment was caused by the influx for the first time of students from many areas of Asia and Africa. The greatest concentrations of foreign students were at Columbia (1,414), the University of California (1,232) and New York university (1,211). At the Massachusetts Institute of Technology, Cambridge, they constituted 9.13% of the total enrolment. The subjects attracting most students were, in order of frequency, engineering, liberal arts and social sciences. In August Japan and the U.S. signed an agreement under which the program of Fulbright educational exchanges was extended to the former. In September more than 350 teachers and educational officials from 43 nations arrived in the U.S. to make a study of educational philosophies and practices.

The sixth annual conference of the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.), June 18 to July 11, at Paris was uneventful in comparison with the stormy session of 1950. Presided over by Howland H. Sargeant, head of the U.S. delegation, the conference stressed fundamental education to reduce illiteracy all over the world, technical aid to underdeveloped nations and work with youth. Perhaps the most significant resolution passed was to establish at an estimated cost of $20,000,000 a 12-year program for the training of teachers in the principles and practices of fundamental education at six geographically distinct centres. The first of these had already been opened in the spring at Patzcuaro, Mex., to train the teachers of the Latin-American area. The 1951 conference also decided to admit territories which still lacked full sovereignty, such as Cambodia, Japan, Laos, Viêt-Nam and western Germany, as associate members; to adopt a budget of $8,700,000 for 1952; and to hold conferences biennially after the 1952 meeting in Paris. The total membership of U.N.E.S.C.O. comprised 64 nations, with 3 countries from behind the "iron curtain" (Czechoslovakia, Hungary and Poland) and Ceylon and Saudi Arabia absent from the 1951 general conference. Other U.N.E.S.C.O. items of interest included a congress of French and German teachers of history during the summer at Mainz, west Germany, to study the problem of improving the content of history textbooks so as to serve the cause of international understanding; the report in November that Spain refused to permit the distribution of a shipment of U.N.E.S.C.O. picture albums which portrayed the struggle for human rights from early times to the present; and the announcement in December of the U.N.E.S.C.O. project for the publication of a six-volume history of mankind by a committee of 1,000 international scholars.

World Trends.—Undemocratic and anti-Semitic sentiments continued to manifest themselves in west Germany as during 1950 and earlier years, in spite of efforts by U.S. and other Allied officials to reorient the Germans toward democracy. In the soviet zone of Germany it was evident that the Communist pattern of higher education was being increasingly imposed over the universities. Educational work by the U.S. continued in Japan, even after the signing of the Japanese peace treaty, but signs of Communist influence were evident, as when 3,000 students sang the Communist hymn and heckled Emperor Hirohito in November at Kyoto. The South Korean government, in spite of the discouragement caused by the war, exerted itself to maintain and improve educational services.

The U.S.S.R. did not let up in its campaign to indoctrinate the peoples in the satellite countries with its political and educational dogmas; in fact, it intensified its efforts on many occasions at home and abroad. In February an influential committee of the Communist party demanded an increase in "scientific atheistic propaganda" by means of lectures in Moscow and its environs. A new minister of higher education, V. Stolstov, was appointed in February by the presidium of the supreme soviet, apparently in response to the publication of a severe criticism of antiquated educational philosophy and practice by *Pravda*. Other events behind the "iron curtain" included the taking over in February by the Chinese Communist regime of the Yenching university, sponsored for 32 years by the United Board of Christian Colleges in China, an organization with headquarters in New York city; and the resolution in June by the Politburo of the Czechoslovakian Communist party to supply new elementary and secondary school textbooks composed in the spirit of communism.

Events of significance in other countries included the passing by the French parliament in September, in reversal of the traditional policy of church-state separation, of two laws granting state scholarships to students of Catholic schools and funds to Catholic groups of parents of primary school children; the opening in Peru of 229 new primary schools and the introduction of educational reforms; demonstrations and disorders by Egyptian and Iranian students, in connection with protests against the British and other foreigners, which led to the closing of the universities in Cairo and in Tehran; the beginning of negotiations between Spain and the Vatican about a concordat to allow Catholic Church officials greater autonomy and freedom in the sphere of education; the launching in November of a defense college in Paris to train senior officers and civilian officials of the 12 nations constituting the North Atlantic Treaty organization in the procedures of international military co-operation; and the founding during the same month at Strasbourg, Fr., of the College of Free Europe, with 85 students who had emigrated from Communist countries, the only college of its kind in the world. In Israel, there were indications of progress in education. After the resignation of the government over the issue of religious education in the immigrant camps, there was a new election and the subsequent coalition government compromised with religious parties to the extent of appointing a religious deputy minister of education. The opening of the new school year in September showed an enrolment of 320,000, twice as many as enrolled in 1949. (W. W. Bn.)

Canada.—The Canadian research committee on practical education ended a four-year exhaustive study into secondary education during 1951 and published 45 specific recommendations, including more stress on arithmetic, grammar and composition; closer relationship between the school and business and industry; longer training for teachers; larger variety of courses for secondary schools; development of basic skills; and creation of a national bureau of educational research. By the end of the 1950–51 school year an estimated 20,000 classrooms in 6,764 schools listened to half-hour radio broadcasts specially written for schools. Although the Canadian Teachers' federation urged federal financial aid to education, and a private resolution in the house of commons called for such financial aid to equalize educational opportunities, the government rejected the proposal on the grounds that it would be a federal invasion of provincial rights. However, the government did propose, and parliament accepted, a grant of about $7,000,000 to Canadian universities.

British Columbia continued to be the province spending most per capita on education, or $13.87 against the low of New Brunswick's $6.60. Making the proceeds of the sales of school lands available for wider investment opened the way for more badly needed aid to Manitoba schools. In Ontario a new interpretation of the Separate (Catholic) School act meant a larger share of taxation for such schools. A $20,000,000 school construction program got under way in Quebec for the separate (Protestant) schools of that province. Newfoundland raised compulsory education from 14 to 15 years.

Parliament voted $1,250,000 to the provinces for 1951–52 capital expenditures for vocational schools, buildings and equipment. During 1950–51 the vocational training branch of the federal department of labour administered $5,670,920 for the training of 22,075 students in full-time courses and 157,000 in other courses. (C. Cy.)

Great Britain.—In Nov. 1950 the Durham county council threatened to dismiss any of its employees who were not members of a trade union or professional organization. The National Union of Teachers protested on behalf of its members and, failing to obtain satisfaction, in April 1951 made arrangements for them to resign from their posts. At this point the minister of education intervened with an order to the Durham authority to rescind its decision. For a while the council resisted, but finally gave way. In August the teachers' representatives complained to the minister of education that the authority was still operating the "closed shop" policy by insisting that applications for special leave or extension of sick leave benefit should be submitted through the employee's organization.

The first report of the National Advisory Council on the Training and Supply of Teachers, published in May, showed the number of teachers in maintained and assisted primary and secondary schools in 1950 to be 209,000. It estimated that by 1954, because of the increased birth rate, 229,500 would be required to maintain 1950 staffing standards. To meet the needs of the secondary schools, one-third of each year's output of arts and science graduates from the universities would be required. The supply of mathematics and science graduates had been insufficient, and there was a shortage of women teachers. In January the minister of education approved the Burnham committee's recommendations on salaries for teachers in maintained and aided schools. In April the president, former president and general secretary of the National Union of Teachers, at the invitation of the Soviet Teachers' union, paid a ten-day visit to the U.S.S.R.

In April King George's Jubilee trust held a conference attended by almost all the leaders of the youth service in the United Kingdom to discuss the principles on which the service was based and improvement in its practice. It was announced in September that a small "pilot" experiment in the use of television in schools was being planned by the British Broadcasting company and the School Broadcasting council. This would be followed by a "main" experiment a year later. The number of schools registered as making regular use of school broadcasts in 1951 was 22,411 compared with 20,192 in 1950. The first progress report of the Education Foundation for Visual Aids, set up in 1948, was published in October.

Approximately 800 pupils from 20 Glasgow, Scot., schools took part in summer visits to Belgium, France, Scandinavia and Switzerland, up to one-half their expenses being paid by the Education committee. Eggs.

Partly as a result of high meat prices, U.S. egg consumption in 1951 was at a new record high of about 406 eggs (52.9 lb.) per person, 7% more than the 395 eggs of 1950 and 42% more than before World War II. Farm production was estimated to exceed slightly the record of 5,003,800,000 doz. produced in 1950. The 458,700,000 potential layers on farms on Dec. 1 were about 3% more numerous than in 1950, and egg production at that time was 7½% greater than at the same time in 1950; it was indicated that an increased rate of about 4% would probably carry through the spring laying season of 1952, and that most of the forecast increase in 1952 over 1951 would occur in the first three quarters of the year.

Egg prices received by farmers in Dec. 1951 were 51.1 cents per dozen as compared with 45.2 cents per dozen in May 1951, the usual time of seasonal surplus, low prices and storage accumulation. In contrast, eggs had brought farmers 29.6 cents per dozen in May and 57.7 cents per dozen in Dec. 1950.

Total holdings of shell and frozen eggs in storage at the end of November were only about three-fourths as large as in 1950. Stocks of dried eggs were less than one-fourth as large as a year before; in 1950–51, 56,666,000 lb. of dried eggs, with a value of $19,375,000, were exported as compared with 36,172,000 lb., valued at $42,976,000, in the preceding year. The Commodity Credit corporation continued to dispose of its holdings, reducing from 40,411,022 lb. on June 30 to 17,027,427 lb. on Oct. 30.

Indicated world egg production in 1951 was about 1% greater than in 1950 and about two-fifths above prewar; decreases in northwestern Europe were offset by increases in the U.S., western Germany, Italy, Austria and Finland. The United Kingdom in the spring of 1951 granted a 5% increase in egg prices, to maintain production. (J. K. R.)

Egypt.

An independent kingdom of northeast Africa, Egypt is bounded north by the Mediterranean, south by the Anglo-Egyptian Sudan, east by Israel and the Red sea, west by Cyrenaica and the Sahara. Area: 383,000 sq.mi. Pop. (mid-1950 est.): 20,439,000. Language: mainly Arabic (97%). Religion: Moslem (mainly Sunnites) 91.4%; Christian (mainly Copts) 8.19%; Jewish 0.4%. Chief towns (pop., 1947 census): Cairo (cap., 2,100,506); Alexandria (925,081); Port Said (178,432); Tanta (139,965); Mahalla el Kubra (115,509); Suez (108,250); Mansura (102,709). Ruler: King Farouk I; prime minister in 1951: Mustafa el Nahas Pasha.

History.—The year 1951 was dominated by a severe deterioration in relations with the United Kingdom. The Wafd had negotiated the agreement of which the Anglo-Egyptian treaty of 1936 was the fruit, and it was this party, under the leadership of Nahas Pasha, which had stood firmly by the Allies during the military crisis of 1942. These circumstances had given rise to the expectation that the return to power of the Wafd in 1950 would be followed by another satisfactory adjustment of Anglo-Egyptian relations. Early expectations that this might be so were already diminished by the events of the first year of Nahas Pasha's new period of office.

In Jan. 1951 Egyptian and British naval units took part in joint manoeuvres, and in March land forces of the two countries engaged in joint exercises in the Sinai peninsula. In March a long-term settlement covering the use of Egypt's sterling balances was announced but, when it became apparent that political negotiations were in prospect, anti-British demonstrations made it clear that they would be beset with difficulties. On the British side, the house of commons, where there was a considerable irritation with Egypt, arising from the latter's policy of restricting the free use of the Suez canal in consequence of the continued official state of war with Israel, expressed anxiety at reports of the British government's intention to withdraw from the Suez canal, and in April the foreign secretary, Herbert Morrison, promised that the house would have an opportunity to veto any agreement that might be arrived at in this connection. In May, the Egyptian foreign minister, Mohammed Salah el Din, declared that British proposals were inadequate and that Egypt stood by its demand for complete evacuation and the unity of the Nile valley. Egyptian proposals involving the immediate evacuation of the Suez canal were rejected by the United Kingdom in June, and feeling was exacerbated when an Egyptian corvette stopped and searched the British supply ship "Empire Roach" in the Gulf of Aqaba. In July British forces in these waters were reinforced, and a week later Egypt officially rejected an invitation to attend a conference on African defense. In August Salah el Din publicly accused the British government of "closing the door" on further useful discussions and Aug. 26, the 15th anniversary of the signing of the Anglo-Egyptian treaty of 1936, was marked by demonstrations in Cairo which degenerated into rioting.

In August there was a good deal of talk in Egyptian circles of the abrogation of the 1936 treaty. The British government attempted to keep negotiations alive, but an important new factor made itself felt when it became known that a proposal to set up a joint middle eastern command had been agreed to in Washington, and that Egypt would shortly be approached to join such a body which would be linked to the North Atlantic Treaty organization. On Oct. 8, before the official approach to the Egyptian government in this connection, Nahas Pasha acted unilaterally by tabling decrees in the chamber of deputies to approve the abrogation of the 1936 treaty which provided the legal basis for the presence of British troops in the canal zone. At the same time he asked the Egyptian parliament to agree to the abolition of the Anglo-Egyptian condominium over the Sudan, with the proclamation of King Farouk as "King of Egypt and the Sudan." The next day the British government, through the foreign secretary, issued a statement taking the strongest exception to Egypt's action and announcing its intention to adhere to the treaty right by which troops were maintained in Egypt.

On Oct. 13 the proposals for joint defense which had been anticipated by Nahas Pasha's action were presented to the Egyptian government by the ambassadors of France, Great Britain, the United States and Turkey. These provided for the creation of a new middle east command in which Egypt would be an equal partner, and the British government indicated that it would agree, if these proposals were accepted, to the supersession of the treaty of 1936 and the immediate surrender of the Suez canal zone to the Egyptian government, on the understanding that it would become an Allied base with full Egyptian participation.

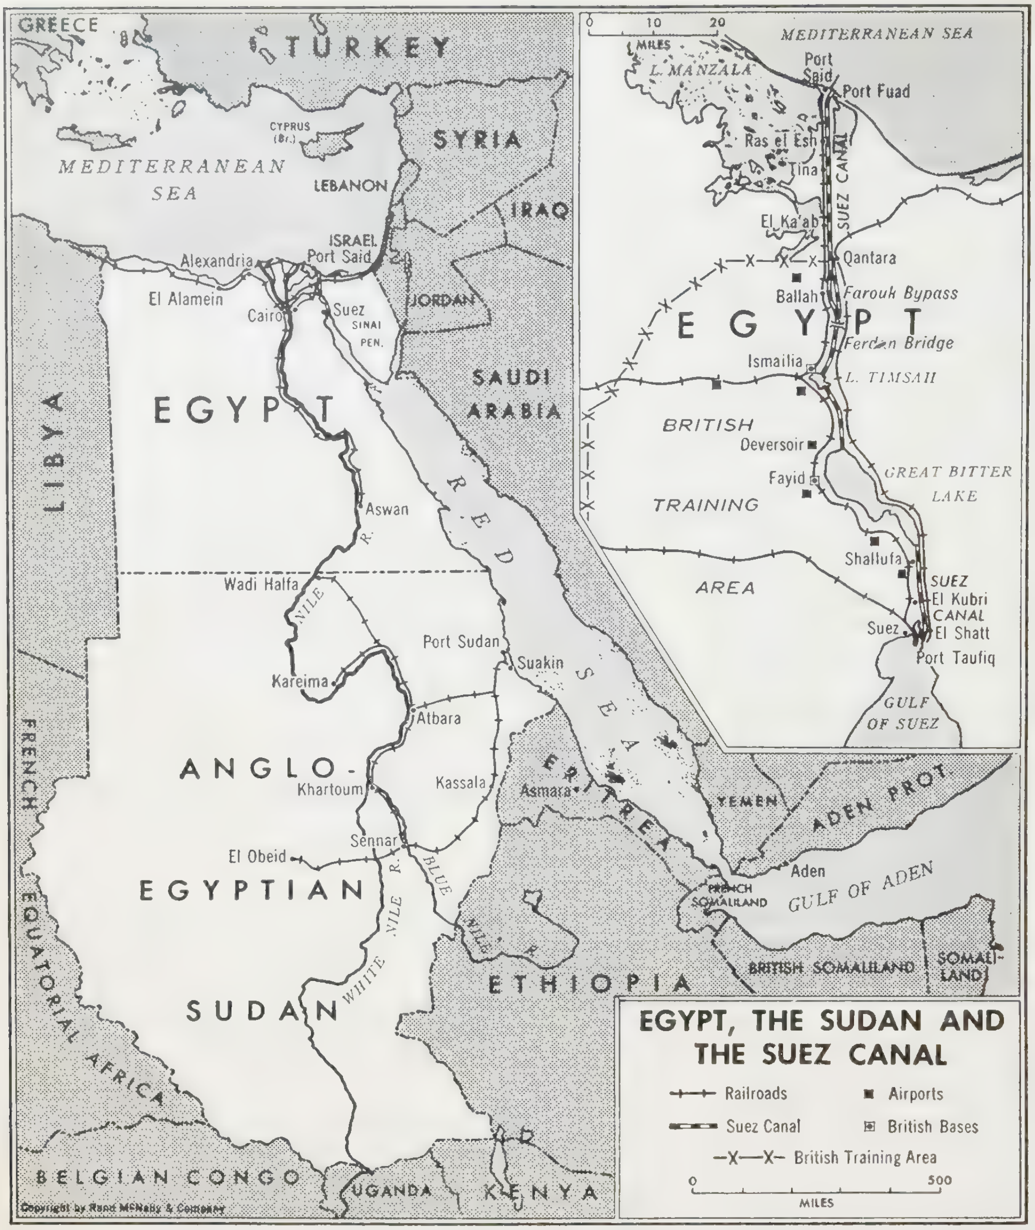
In mid-October a state of emergency was declared, and the British forces in the canal zone, heavily reinforced, began to prepare themselves as for a siege. The canal was kept in full operation. On the Egyptian side, the Arab league did not make the immediate rejection of the western military proposals which had been looked for.

Charges and countercharges were frequent during November, each side standing its ground, and there were some outbreaks of violence involving loss of life, but for the most part the situation remained comparatively calm, a notable feature being the continued close liaison of British and Egyptian armed forces. Bad feeling between the British and the Egyptian police in the affected areas was a major cause of such violence as occurred.

On May 6 King Farouk was married, for the second time, to Narriman Sadek, the daughter of a government official. Substantial measures for rearmament were planned and a £6,000,000 social security program was inaugurated at the end of January. A royal decree on May 12, appointing replacement for 36 term-expired senators, gave the Wafd a clear majority in that house. (*See* also ANGLO-EGYPTIAN SUDAN; MIDDLE EAST; SUEZ CANAL.) (H. S. D.)

Education.—Government schools (1948–49): kindergarten 57; primary 327, pupils 100,000; elementary 5,000, pupils 1,000,000; technical 70, pupils 17,136; commercial 17, pupils 5,481; agricultural 13, pupils 2,725;

EGYPTIAN TROOPS marooned temporarily on the western side of the Suez canal in Oct. 1951, when British forces occupied the El Ferdan bridge following anti-British disturbances in Egypt. The Egyptian forces' camp was on the eastern side of the canal



domestic science 15, pupils 1,763. Nongovernment schools: primary 452; secondary 76. Teachers' training colleges 53, pupils 8,382. Universities 3, students 20,259. Other institutions of higher education 8.

Finance and Banking.—Budget: (1950–51 est.) revenue £E178,000,000, expenditure £E206,000,000; (1951–52 est.) revenue £E212,400,000, expenditure £E231,000,000. National debt (April 1948): £E125,000,000. Currency circulation (Sept. 1951): £E177,100,000. Gold and foreign exchange (April 1951): U.S. $777,000,000. Bank deposits (May 1951): £E167,300,000. Monetary unit: Egyptian pound with an exchange rate of £E0.349 to the U.S. dollar.

Foreign Trade.—(1950): Imports £E196,500,000; exports £E175,400,000. Main sources of imports (1950): U.K. 19.4%; France 9.8%; Italy 7.3%; U.S. 5.9%. Main destinations of exports: U.K. 21.7%; India 12.5%; U.S. 8.8%; Italy 8.5%. Main imports: machinery 9.5%; wheat and flour 8.1%; fertilizers 5.9%. Main exports: cotton (raw) 85.4%; rice 4.4%; cotton yarn 1.4%; onions 1.2%.

Transport and Communications.—Roads (1947): 8,874 mi. Licensed motor vehicles (Dec. 1950): cars 59,000, commercial 17,000. Egyptian state railways (1949): 5,318 mi. Shipping (merchant vessels of 100 gross tons and over, July 1949): 57; total tonnage 105,462. Telephones (1948): subscribers 98,093. Radio receiving sets (1949): 183,000.

Agriculture.—Main crops (metric tons, 1950): ginned cotton, 377,000; maize 1,287,000; wheat 1,018,000; barley 91,000; millet and sorghum (1949) 567,000; paddy rice, 1,241,000; sugar, raw value 180,000; onions 217,000; potatoes 160,000; broad beans (1949) 321,000. Livestock (March 1947): cattle 1,321,000; sheep 1,875,000; goats 1,474,000; asses 1,125,000; horses 28,000; mules 12,000; camels 197,000; buffaloes 1,240,000; pigs 50,000; chickens 16,312,000. Fisheries (1948): total catch 48,350 metric tons.

Industry.—Crude oil production (1950) 2,343,000 metric tons. Raw materials (metric tons 1949): phosphate rock 350,000; manganese ore 138,000; salt 350,000. Manufactured goods: cotton yarn (1949) 38,720 metric tons; cotton piece goods (1949) 151,000,000 sq.m.; cement (1948) 768,000 metric tons.

Eire: *see* IRELAND, REPUBLIC OF.

Eisenhower, Dwight D.

(1890–), U.S. army officer, was born on Oct. 14 in Denison, Tex. He was graduated from the U.S. Military academy at West Point, N.Y., in 1915, and during World War I served as an instructor, camp commander and commander of tank troops. He was graduated later from the Army War college and the Army Industrial college, both in Washington, D.C., served in the office of the chief of staff in Washington, D.C.

In 1935 he saw duty in the Philippines as chief of staff to Gen. Douglas MacArthur.

During World War II he was commanding general of the Allied armies that conquered North Africa and Sicily (1943), invaded Italy (1943), landed in France (1944) and completed the conquest of Germany from the west in 1945. He was made commander of U.S. occupation forces in Germany in 1945 and chief of staff Nov. 20, 1945, retiring from that post Feb. 7, 1948, to become president of Columbia university. On Dec. 19, 1950, he took leave from Columbia to become supreme Allied commander of the integrated North Atlantic treaty forces set up for the defense of western Europe.

He spent much of 1951 organizing both U.S. and European participation in the pact armies, and on April 2 formally activated and assumed command of SHAPE—supreme headquarters, Allied powers in Europe. After touring west Europe early in 1951, he appeared before U.S. congressional committees to report on western European defense measures. He told the committee he would "instantly" use the atomic bomb in any new war if the net advantage was on his side.

Prominently mentioned as a possible presidential candidate, Eisenhower announced on Jan. 7, 1952, that he was a Republican. He said he would not ". . . participate in the pre-convention activities . . ." and would continue as SHAPE commander "In the absence . . . of a clear-cut call to political duty . . ." It was inferred that he would accept the Republican nomination, if it were offered him.

Various polls indicated that he would be a strong contender if nominated.

Elections, U.S.

The off-year elections of 1951 in the United States followed the pattern of a slight trend toward the out-of-power Republicans. The minority party made gains in ten special elections to fill vacancies in the house of representatives, and scored even more impressively in mayoralty contests held throughout the country on Nov. 6, especially in industrial centres.

In the special congressional contests, the Republicans retained four seats in normal Republican strongholds—the 3rd Maine district, the 3rd Nebraska, the 9th New Jersey and the 8th Pennsylvania. The Democrats did the same in the 6th Kentucky, the 33rd Pennsylvania, the 9th Texas and the 5th West Virginia districts.

But the Republicans picked up two new seats in the 11th Missouri and the 3rd Ohio districts. In the Missouri contest a Republican won by 6,000, as against a Democratic majority of 26,000 in 1950. The outcome in the 3rd Ohio district, which lies within the industrial city of Dayton, was regarded as an upset. The G.O.P. won by 12,727 votes, whereas Democratic majorities were 15,000 in 1950 and 31,000 in the presidential year of 1948.

The 6th Kentucky outcome also gave encouragement to the minority. In 1950 the Republicans did not enter a candidate in this normally Democratic border state of Vice-Pres. Alben W. Barkley. In the 1951 test they rolled up 44.7% of the vote in a light turnout at the polls.

As a result of these changes, the house membership at the year's end was 232 Democrats, 201 Republicans, 1 Independent and 1 vacancy. At the opening of the session in Jan. 1951, it had been 234 Democrats, 199 Republicans, 1 Independent and 1 vacancy.

The Republican gains in the mayoralty races occurred in such industrial and Democratic territory as New England, New York, New Jersey, Pennsylvania, Ohio and Indiana, indicating that the labour and regular vote had stayed at home or deserted the Democrats. Indianapolis, where the Republicans deliberately based their campaign on national issues, defeated a Democratic mayor by 10,000 votes. The mayoralty results in Indiana were typical of those in various other states. In all, the G.O.P. won 72 and lost 29 cities in the Hoosier state. They gained 36 cities and kept 36 they had held previously.

In New York city, Rudolph Halley, who had served as counsel to the Kefauver crime committee of the senate and was running as an Independent, won the presidency of the city council by a sizable majority over Democratic and Republican nominees. A newcomer to politics, Halley gained fame when, at televised hearings, he helped expose an apparent alliance involving Tammany officeholders, the police and the underworld. His victory served to emphasize the possible value of television as a factor in politics.

The Republicans were the losers in Philadelphia, and the upset there was likewise a showing of public resentment against corruption in government. A G.O.P. machine was driven from office after more than 65 years of control of the city hall. City Controller Joseph S. Clark, Jr., a lawyer, defeated Daniel A. Poling, a Baptist minister, by 122,210 votes. So general was the revolt against the machine that the *Philadelphia Inquirer,* historic Republican newspaper, supported Clark.

In Boston, Mayor John B. Hynes defeated former Mayor James M. Curley by 75,000 votes. Mayor Hynes's lead over Curley had been only 12,000 votes in 1949. But the latter had served a federal prison term in intervening years, and his power and popularity had vanished, despite a presidential pardon. So certain was defeat that Curley conducted no campaign.

A possibly significant event was the election of the first Republican mayor of Little Rock, Ark., in 70 years. The successful candidate was Pratt Remmel.

The only two gubernatorial elections were in Kentucky and Mississippi. Democratic Gov. Lawrence W. Wetherby won easily in Kentucky, where the Republicans had captured this post only three times in 40 years. Former Gov. Hugh White, an anti-Truman States' Rights Democrat, also won an easy victory in Mississippi.

Although understandably optimistic over the general trend of the 1951 elections, Republican leaders' rejoicing was restrained, insofar as omens for 1952s presidential election were concerned. They recalled that they had won even greater victories in the 1946 off-year elections, only to fail to capitalize on them in the national elections in 1948. (*See* also COMMUNISM; DEMOCRACY; DEMOCRATIC PARTY; REPUBLICAN PARTY; UNITED STATES; and under various states and various countries of the world.)

(R. Tr.)

Electrical Industries.

Continuation of the acceleration in industrial activity which took place in 1950 appeared in the records of the U.S. electrical industry for 1951. Energy produced for the public supply in 1951 rose to an estimated 372,000,000,000 kw.hr., an increase of 13% over the 329,141,343,000 kw.hr. generated in 1950. This increase of about 43,000,000,000 kw.hr. thus became the largest increase ever recorded in the industry's history, topping the record increase of 38,042,000,000 kw.hr. of the previous year by about 5,000,000,000 kw.hr. In generating this output in 1951, the average kilowatt of hydro capacity produced at name plate rating for 65.2 hr. out of every 100, surpassing any year on record for the second time in two years. Fuel-burning capacity produced at name plate rating for about 57 hr. out of every 100.

Fuel-burning power plants provided about 34,800,000,000 kw.hr. of the total increase, raising the proportion of fuel power generation from 71% in 1950 to 72% in 1951, the hydro plant proportion of output thus declining from 29% in 1950 to 28% in 1951. In the 12 months ended Oct. 31, 1951, the usage of coal, oil and gas was 150,170,000 tons of coal equivalent, as com-

TEST CHAMBER for street lights at the General Electric laboratories, Lynn, Mass. Acting as a camera, the chamber focused light on the test stand with its light intensity meter (far end) while circular curtains prevented any reflection of light

pared with the consumption of 138,420,000 tons of coal equivalent in 1950. Actual coal consumption in the 12 months ended Oct. 31, 1951, was 104,520,000 tons, as against 91,866,000 tons in 1950. In the same 12-month period, usage of oil dropped to 63,830,000 bbl. from 75,420,000 bbl. in 1950, while consumption of gas rose to 748,660,000,000 cu.ft. from 628,920,000,000 cu.ft. in 1950.

Of the total energy output in 1951, private power companies generated about 81.4% as compared with 81.1% in 1950, with plants owned by Rural Electrification administration (REA) co-operatives, municipalities, public utility districts, state projects and the federal government providing the remainder.

Power Plant Capacity.—The net increase in generating capacity in 1951 up to Nov. 1 was 5,795,000 kw., raising the total as of that date to 74,678,000 kw. The actual increase in 1951 was somewhat more than this, with some new generating units scheduled for operation in November and December. The reported new capacity installed in 1951, not all representing net increase, was 6,112,500 kw. Preliminary estimates set the non-coincident peak load at about 69,498,000 kw. and indicated that reserve capacity would be about 7.5% as compared with 11.9% reserve in 1950.

Ratios of fuel and hydro generating capacity remained little changed in 1951 from 1950. In the earlier year, fuel-burning capacity was 74.4% and hydro capacity 25.6% of the total; in 1951 the ratios were 74.9 and 25.1%. As of Nov. 1, 1951, private power companies owned 79.6% of the generating capacity as against 79.8% in 1950. Ownership of the remaining capacity was divided among REA co-operatives, municipalities, public utility districts, state projects and the federal government.

Electricity Sales.—Electric utility customers purchased an estimated 318,700,000,000 kw.hr. of energy in 1951, an increase of 38,161,000,000 kw.hr. over 1950. This increase may be compared with the 31,997,000,000-kw.hr. increase of 1950 over 1949. For the second time in two years industrial usage was responsible for more than 57% of the increase over the previous year. In 1950 large industrial customers bought 139,065,000,000 kw.hr., but in 1951 their usage rose to 161,700,000,000 kw.hr. Sales to residential and rural customers continued to increase. In 1951 sales to these customers were 83,700,000,000 kw.hr., about 9,270,000,000 kw.hr. more than sales in 1950, which in turn were 8,907,000,000 kw.hr. more than in 1949. The average annual residential use of electricity rose from 1,830 kw.hr. in 1950 to 2,012 kw.hr. in 1951, an increase of 182 kw.hr.

Revenues.—Customers paid the suppliers of electricity $5,640,000,000 in 1951, about $553,000,000 more than in 1950, a 9.8% increase. This was associated with an 11.9% increase in sales and reflected a continuation of energy usage at lower steps in rate, mostly because of industrial usage. The average revenue from all customers continued to decline, going to 1.77 cents per kilowatt hour in 1951 from 1.81 cents per kilowatt hour in 1950.

Residential customers continued to enjoy a decrease in the unit price they paid for electrical energy, 2.82 cents in 1951, as against 2.88 cents in 1950 and 2.95 cents in 1949. Because of their increased use of electricity, residential customers paid an average annual bill of $56.70, $4 more than in 1950. The 1951 increase of 182 kw.hr. in usage cost the average customer 2.2 cents per kilowatt hour.

Users.—The number of electric utility customers as of Oct. 31, 1951, was 46,774,129, an increase of 1,787,835 over 1950. The largest increase continued to be in the residential class, which rose by 1,699,310 to a total of 40,828,005. Industrial and commercial customers increased slightly from 5,700,909 in 1950 to 5,784,268 in 1951.

The number of people in homes served by electricity in 1951 was about 146,500,000 or approximately 96.5% of the total population.

Financial.—Securities issued by private power companies in 1951 reflected the trend of the cost of money on the open market. Although new capital entering the business in 1951 was $1,432,257,000 as compared with $1,300,040,000 in 1950, refunding operations showed a marked decline in going to only $9,690,000 in 1951 from $407,797,000 in 1950. The total financing in 1951 was thus $1,441,947,000 as compared with $1,707,837,000 in 1950.

The share of the revenue dollar available for dividends and surplus in 1951 decreased sharply because of higher taxes. In 1950 the proportion was 18.5 cents; in 1951 it was 16.3 cents. The gross operating revenue of private companies rose from $4,497,000,000 in 1950 to $4,955,000,000 in 1951. Net income in 1951 was $814,000,000, which amount was $17,000,000 less than the net income reported in 1950. This was the first time since 1942 that net income did not top the previous year's figure.

Electrical Manufacturing.—During 1951 the indexes for manufacturing activity were revised on the basis of 1947-49 = 100. Thus, in that year the board of governors of the federal reserve system estimated index of general industrial production was set at 119, 11 points above 1950 and 15 points above 1948, the record pre-Korean war year. The index for the electrical manufacturing industry rose to 149.5, or 13.4 points above 1950 and 51.1 points above 1949. The index for electrical appliances for domestic use dropped to 137.9 in 1951 from 161.5 for 1950, but was still 37.7 points above 1949 and 29.5 points above 1948. The industrial apparatus index continued to mount by going to 176.6, 62.5 points above 1950 and 91.5 points above 1949. (*See* also PUBLIC UTILITIES; RURAL ELECTRIFICATION; TENNESSEE VALLEY AUTHORITY.) (F. J. K.)

Canada.—Notable expansion of electric power generation facilities marked 1951. In British Columbia the Aluminum Company of Canada had more than 3,000 men at work creating a lake and driving tunnels for a power plant of 1,600,000-h.p. capacity to supply an aluminum mill being erected at Kitimat. The private British Columbia Electric Co., Ltd., was in a five-year $87,000,000 expansion program, and the public British Columbia Power commission was expanding at the rate of $7,000,000 for 1951. Ontario signed an agreement with the federal government for the creation of 1,100,000 h.p. of energy from the improvements to the St. Lawrence waterway between Prescott and Cornwall, and proceeded with the $157,000,000 development of 600,000 h.p. from Niagara falls by 1954.

Retail credit curbs were held responsible for midyear curtailment of production of electrical appliances, but there was improvement by October, and Canadian Westinghouse and Canadian General Electric went ahead with their expansion programs totalling $22,000,000. By October the electrical industries were using only 2% of their facilities for defense production, with the expectation that it would double by mid-1952. The industry formed the Canadian Adequate Wiring bureau to raise wiring standards in residences. (C. Cy.)

Europe.—*Generating Plant.*—The demand for generating plant, both for home use and for export, remained insistent during 1951. Shortages of labour and raw materials, occasioned partly by the rearmament drive, created difficulties. Nevertheless, the supply position showed some improvement. Early in the year it was announced that the British Electricity authority (B.E.A.) had placed orders for £21,500,000 worth of generating plant comprising 57 turboalternator sets with an aggregate capacity of about 2,500 megawatts. Hydrogen cooling for large turboalternators was being increasingly employed and among the hydrogen-cooled sets under construction were several of 60-Mw. capacity. The manufacture of water-turbine sets was also very active and a vertical reaction turbine supplied to Portugal by a British manufacturer was of 63,000 b.h.p. Work on generation by atomic power showed that there was a reasonable prospect of its large-scale development but the cost of energy would probably not differ widely from that generated by coal.

Transmission Equipment.—The increasing need for bulk transmission of power over long distances in several European countries was reflected in plans for stepping up transmission voltages and in the development of larger sizes of circuit breakers and other control equipment. In Sweden, France and western Germany 225-kv. systems had been in operation for several years, but to facilitate later interconnection of national systems, agreement was reached upon unification of new voltage levels. Two values had been adopted, namely 275/300 kv. and 380/400 kv. The plans for the B.E.A. supergrid were a first step up from the 132 kv. of the existing grid but provision was being made in tower designs for subsequent conversion to 380 kv. if this should prove economically desirable. The next step in countries already having 225-kv. systems was an increase to 380 kv.

Utilization.—One of the most interesting developments was the Pimlico, London, district-heating scheme which was formally inaugurated in July. From two 1,350-kw. back-pressure turbo-alternators, installed in Battersea power station for auxiliary power supply, heat was provided for a 30-ac. housing estate and for blocks of flats, both located on the opposite side of the river from the power station. Pipes carrying hot water were run under the river through an existing tunnel. Space heating and hot water were to be given eventually to 2,900 dwellings and some communal buildings, thus serving approximately 10,000 people. A large-capacity hot water accumulator facilitated co-ordination of heat and electric loads, giving a high annual load factor for the system. The estimated annual saving of coal was 10,000 tons.

An international conference on illumination was held in Stockholm, Swed. There was much interest in British research on high-speed flash photography using a xenon-filled tube with a hydrogen-filled thyration for pulse control. There was interest also in luminescence and particularly in the luminous capacitors being developed in the United States. These provided a low-intensity light source based on the electroluminescence of a phosphor under the influence of a rapidly changing electric field.

Published figures on the use of electric motors on British farms showed that the number had increased from about 3,500 in 1931 to 91,750 in 1950.

The use of electricity in mining increased and resulted in a greater output per man shift.

Research and New Developments.—Both through technical papers and "open days" at several industrial research laboratories, electrical research attracted considerable attention. The researches reflected contemporary preoccupation with generating-plant developments and with high-voltage transmission. They included investigations on metals for gas and steam turbines, on magnetic materials, using both optical and X-ray diffraction methods for determining crystal orientation, on the performance of transformers and other high-voltage equipment under impulse tests with voltages of 2,000,000 or more, and on the connections between the structure and dielectric properties of materials. High-tension switchgear and cables, mercury-arc rectifiers, high-voltage direct-current transmission, radio interference from power circuits, and wind power were other subjects of research.

Trade.—The value of all electrical goods and machinery exported from Great Britain in Sept. 1951 was £12,919,529, as compared with £10,111,528 for Sept. 1950. In August and July 1951 the totals of £14,162,700 and £13,974,738 respectively were both records for any month. (E. W. G.)

Electric Transportation.

Continued expansion of trolley coach operation was the most notable development of the year 1951 in the field of electric transportation in the United States. Inauguration of service on a new subway route in Chicago, Ill., was also a development of major significance. A moderate number of new cars was placed in service on the electric surface railway lines, and a substantial number of multiple-unit cars was added to the equipment of the electrified suburban railroads.

Electric Trolley Coaches.—At the beginning of 1951 a total of 6,500 electric trolley coaches were being operated on 42 transit systems. This was more than double the number of vehicles in operation ten years earlier. During this period the mileage of trolley coach routes had increased by 80%.

In 1951 about 636 additional trolley coaches were placed in operation, bringing the total at the end of the year to more than 7,100.

Preliminary figures indicated that riding on trolley coaches reached an all-time peak of nearly 1,300,000,000 revenue passengers in 1951. To handle this business a total of about 215,000,000 vehicle miles were operated, giving a ratio of slightly more than six revenue passengers per vehicle mile. The fact that this was the highest average of revenue passengers per vehicle mile of any type of transit service was an indication of the high degree of popularity enjoyed by trolley coach operation.

Delivery was started on the largest single order for trolley coaches ever placed in the United States—349 units for Chicago. A notable instance of trolley coach expansion during the year was the inauguration of service on the heavily travelled Grand river route at Detroit, Mich. A total of 80 new trolley coaches replaced streetcars on this route. Another significant development was the completion of the conversion from steel-wheeled to rubber-tired vehicles at Des Moines, Ia. This program was started a number of years earlier. After a thorough study of the situation the local transit operating company decided to use trolley coaches on all lines operating on headways of ten minutes or less, and to use motor buses on lines with headways of more than ten minutes. With the completion of the conversion a total of 159 trolley coaches were in operation.

Results were said to be extremely satisfactory.

Despite the large number of trolley coaches delivered in 1951, orders were placed during the year for 69 additional vehicles of this type. The new vehicles were scheduled for operation in New Orleans, La., and Indianapolis, Ind.

Surface Electric Railways.—In late years the operation of surface electric railway cars had been concentrated more and more on the heavily travelled lines in large urban centres. At the beginning of 1951 a total of 13,800 electric surface cars were in operation on 84 electric transit systems. However, 47 of these systems were classed by the American Transit association as interurban, and 30 of them operated only freight service. Thus the number of cars in interurban service was comparatively small, while the great majority were found on the 42 urban systems.

Rolling stock added during the year included 25 cars of the so-called president's conference committee type for San Francisco, Calif., and 50 of these cars for Boston, Mass. These brought the total of the modern vehicles in operation in the United States to 4,354.

Rapid Transit Lines.—In the cities of more than 1,000,000 population, rapid transit lines carry more passengers than any other type of public transportation service, and many improvements were being made in rapid transit facilities. All of the new construction begun or proposed during the past few years was in subway or open cut.

Elevated railways were being gradually eliminated. The same number of passengers were being carried in 1951 over the same mileage of track by approximately 10% fewer cars than were in use ten years before.

The most notable of the developments in the rapid transit field during 1951 was the inauguration of service on the new Milwaukee-Dearborn-Congress subway route in Chicago. This was the second and final step of the initial phase of that city's subway building program. The State street subway, completed in 1943, was the first step.

Both of these projects were started in 1938. The State street line is a two-track subway about five miles in length. Its total cost was approximately $34,000,000. At one end it connects with the north side elevated line and at the other with the south side elevated line, providing through north-south rapid transit service.

The Milwaukee-Dearborn-Congress line was started at almost the same time as the State street line, but construction had to be halted when it was about 60% finished, because of material shortages during World War II. Work was resumed in 1946 and the line was ready for operation early in 1951. It is a two-track subway about four miles in length, costing approximately $30,000,000. Extending northwesterly from a downtown terminal at La Salle street to a connection with the Logan square elevated line near Damen avenue, it has nine closely spaced stations in the downtown district and three more widely spaced stations along Milwaukee avenue.

Plans of the city of Chicago called for the construction of additional subways as extensions of the initial system as soon as internal conditions and financing problems would permit.

Heavy Electric Traction.—Delivery was made during the year 1951 of the remainder of a New York Central order for 100 multiple-unit cars for 600-v. D.C. operation in the Grand Central terminal zone. This resulted in a substantial improvement in commuter service in the New York suburban area. Delivery was also made on most of a Pennsylvania railroad order for 100 multiple-unit cars for operation on 11,000-v., 3-phase, 25-cycle A.C.

Eight straight electric locomotive units were delivered during the year for freight service on the Pennsylvania railroad. They were designed for operation on 11,000-v., single-phase, 25-cycle A.C. Four of these units, rated 3,000 h.p. each, were equipped with rectifiers and D.C. traction motors. Four, rated 2,500 h.p. each, were powered by single-phase A.C. traction motors, and as many as four units could be operated in multiple.

Two similar 2,500-h.p. units with A.C. traction motors were placed in service on the Great Northern railway for operation on mountain grades in the Cascade mountains in the state of Washington. (J. A. Mi.)

Canada.—The 1951 annual meeting of the Canadian transit association, a group representing civic and private mass transportation systems, revealed (1) that higher operating costs were putting many companies in the red, which forecast still higher fare boosts, (2) that manpower shortages were becoming critical, which foresaw the use of women as bus and streetcar operators, (3) that cost reduction was imperative, which made companies consider larger vehicles. However, fare increases seemed to be entering the law of diminishing returns phase, for during 1950 the Canadian transit companies carried 48,239,200 fewer riders than in 1949. Despite this trend, the Toronto transportation commission went from four to three tickets for 25 cents. The last streetcar in Calgary gave way to motor and trolley buses, Hamilton found trolley buses so effective it expanded its fleet by 30, and Ottawa at the end of the year began operating a trolley bus route.

The relative positions of the three main kinds of urban surface transportation are gained from the following 1950 statistics: city electric cars carried 687,317,172 passengers over 83,171,759 mi.; trolley buses carried 193,260,892 passengers over 27,448,593 mi.; and motor buses 575,962,102 over 106,705,554 mi. Electric transportation statistics for Canada for the first seven months of 1951 (compared with the same 1950 period) were: urban revenues $64,169,000 ($62,922,000); interurban revenues $25,370,000 ($24,533,000); urban electric car mileage 45,354,000 (49,320,000); urban trolley bus mileage 17,941,000 (15,214,000); interurban electric car mileage 2,878,000 (3,379,000). (C. Cy.)

Great Britain.—The report of the committee appointed by the British Transport commission was published early in 1951. The committee recommended the adoption as standard of the 1,500-v. D.C. overhead system for future electrification, except for an area to be allocated for the third-rail system of the Southern region. The retention of the fourth rail on the existing London Transport railways and its use on any extensions was recommended.

A committee appointed to investigate transport facilities in Glasgow, Scot., and the Clyde valley submitted to the British Transport commission an electrification scheme estimated to cost £10,000,000 and to save 70,000 tons of coal a year.

Austria.—Electrification expenditure for 1951 was estimated at £8,000,000. In July electrification was extended eastward from Linz to Amstetten (40 mi.) and conversion work was continued between Amstetten and Vienna (79 mi.), the only remaining steam worked section of the great trunk route Vienna–Bregenz (478 mi.). In Carinthia work was begun on the Villach–Tarvisio line (17 mi.), the last link of the electrified route from Salzburg connecting at Tarvisio with the Italian state railways' electrified main line to Udine.

France.—Electric working between Paris and Dijon had led to a considerable cut in timing, and work was well advanced on the Dijon–Lyon section of the Paris–Lyon electrification. There were 2,380 mi. of main line and 125 mi. of suburban route electrified by 1951.

This represented 10% of the whole French national system and carried about 24% of the total traffic.

In May the 50-cycle, single-phase electrification from Aix-les-Bains to Annecy was extended to La Roche-sur-Foron and future extensions were planned from La Roche-sur-Foron to Annemasse and to St-Gervais-les-Bains. The electrification of the Dunkirk-Lille-Mézières-Thionville line in the northern and eastern regions was being considered on this system. The scheme, in which the German federal railways were interested, also envisaged the inclusion of the line from Thionville to Trier and Koblenz in western Germany.

Complete renewal of the Paris Metropolitan rolling stock was planned and the first order was for 200 3-car articulated units valued at £9,000,000.

Italy.—The first electrified section of the Italian state railways in Sicily was opened between Messina and Barcelona-Castroreale (28 mi.). Work was also in hand on the next stage to Sta. Agata di Militello (38 mi.). These sections formed part of the Messina–Palermo (144 mi.) single track main line of which the line between Palermo and Fiumetorto (27 mi.) was being doubled. Power for this electrification was supplied from a new thermal station at Messina. The building of a similar thermal plant at Palermo and a hydroelectric station on the river Troina, south of Catania, was in hand. In addition, aerial power cables bridging the Straits of Messina to link the Sicilian supply with the mainland grid were under construction.

On the privately owned Nord-Milano railway, the line Saronno-Laveno (31½ mi.) via Varese Nord was electrified.

Norway.—Electric traction was introduced on the Lillestrom-Charlottenberg (71 mi.) line via Kongsvinger in June. The conversion on the 1,000-v. 16⅔-cycle single-phase system began in 1948, had cost about £1,253,000 and enabled trains to be worked electrically between Oslo and Stockholm with a saving in journey time of about one hour. Nearly half the total traffic in Norway was carried on 640 mi. of electrified track representing about 23% of the whole mileage.

Poland.—The electrification of the Katowice-Warsaw line via Czestochowa, and the Katowice-Wajcherowo-Pruszcz lines was planned in a six-year economic project. Meanwhile preliminary work on the Warsaw underground railway made progress and shafts were sunk in the centre of Warsaw and in the suburb of Praga. Motor coach equipment for the Warsaw electrified lines to replace wartime losses was delivered.

Spain.—Early in 1951 the Spanish government published its *Development of the General Reconstruction Plan,* covering the railway modernization and electrification program previously approved and more recent developments. On the Torre Branuelas section of the Leon Ponferrada mountain line with a heavy coal traffic, the capacity had been tripled with important economy in operation. The national railway administration planned to electrify, at 3,000 v. D.C., the trunk line from Hendaye on the French border to Algeciras (820 mi.), and sought foreign credit for the work.

Switzerland.—In October the Winterthur-Bauma-Wald standard gauge line (25 mi.) was converted to electric traction. The Swiss government agreed to the construction of a new railway from Sembrancher to Le Chable in the Valais. The line would facilitate tourist access to Verbier and the transport of materials for building the Mauvoisin dam.

The federal railways took delivery of six new lightweight steel restaurant cars, each seating 52. Each weighed 31.5 tons fully equipped. Electricity at 220 v. for the all-electric kitchen, maximum load 39 kw., was taken from a transformer in the 1,000-v. train heating circuit when the train was running at a speed above 25 m.p.h. When stationary or running below this speed, current was taken from a pantograph mounted on the car itself and which was automatically lowered if the speed exceeded 25 m.p.h. or the line supply failed.

Australia.—In February approval was given to the plan for the electrification of seven sections of line in the Brisbane suburban area involving 225 single-track miles. The total cost with ancillary works was estimated at nearly £9,000,000, to be spread over a period of about nine years. A contract valued at £3,000,000 was placed for 1,500-v. overhead track equipment for the extension of the Sydney suburban system. The line from Paramatta to Lithgow in the western coal field of New South Wales was to be electrified and heavy coal trains hauled over the arduous route in the Blue Mountains area. There were 236 single-track miles to be equipped, including four tracks between Paramatta and Doonside and two tracks from Doonside to Lithgow.

India.—Twenty-eight four-car multiple units, each with two 1,500-v. 700-h.p. motor coaches with two intermediate trailer coaches were supplied for the Bombay suburban services of the Bombay, Baroda and Central India and Great Indian Peninsula railways. Built in Great Britain, the coaches were nearly 26% lighter than the conventional types in use. They were subjected to a comprehensive series of practical tests at the makers' works in a specially designed test rig, capable of applying buffing loads up to 150 tons.

New Zealand.—Labour difficulties slowed down progress on the electrification of the Wellington-Hutt Valley line and also delayed completion of the Maraetai hydroelectric scheme. Despite existing 1,500-v. D.C. systems it was decided all future electrification would be single-phase A.C. (*See* also RAILROADS.) (J. W. GR.)

Electrification, Rural: *see* RURAL ELECTRIFICATION.

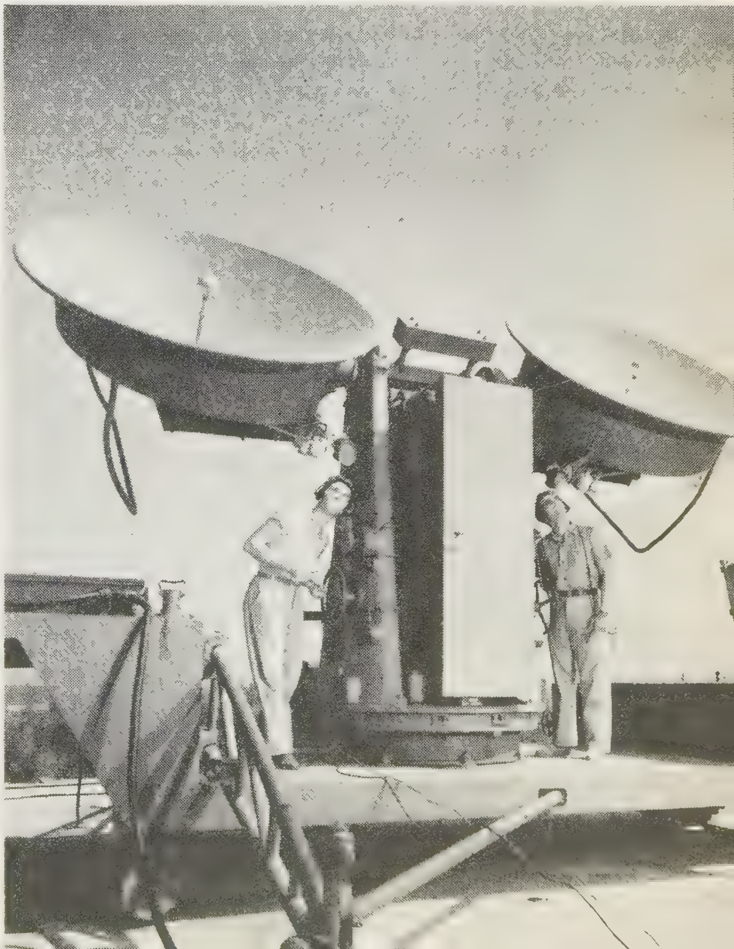
Electronics.

During 1951 there was a marked increase in interest in applications of cathode rays, with several research groups working on them. For example, they showed considerable possibilities in sterilizing materials, especially things like blood plasma, which may be damaged by heat. Cathode rays allow sterilization with very slight heating.

In addition, they can be used to accelerate certain chemical changes. J. V. Schmitz and E. J. Lawton, of the General Electric Research laboratory, reported that the rays induce polymerization, which is the linking of small molecular units into long chains. In this way they were able to convert various liquid raw materials into solid plastics, thus extending and confirming earlier work in the same laboratory by W. D. Coolidge, who had polymerized castor oil.

R. E. Hungate, M. P. Bryant and E. Hall, of the department of bacteriology, State College of Washington, Pullman, reported on a joint research with W. D. Bellamy and E. J. Lawton, of the General Electric laboratory. They showed that, by exposure to electrons of 800,000 v. energy, sawdust is made digestible by organisms found in a cow's rumen. This led to suggestions that sawdust might thus be converted into cattle fodder. The experiments, however, were performed only in test tubes, and no

DOPPLER RADAR UNIT for the continuous recording of the speed of rocket-powered pilotless aircraft at a research station on Wallops Island, Va. Operators kept antennas focused by sight, and later by sound through earphones



tests were made in feeding cattle with irradiated sawdust.

Another electronic development of biological interest, reported at the Cleveland meeting of the American Association for the Advancement of Science, was a miniature radio station that is carried by an experimental subject and broadcasts his brain waves or other signals, such as those indicating electrical activity associated with heart beats. This was described by N. J. Holter, of the Holter Research foundation at Helena, Mont., and J. A. Gengerelli, of the University of California at Los Angeles.

Normally, to obtain such records of brain or heart activity, the subject must be directly connected to the recording apparatus and his movements are severely restricted. The new device, however, includes a compact unit, containing the power sources, amplifier and radio transmitter. This weighs only a few pounds and is small enough to be carried in the subject's pocket or hung on a belt as he walks around, engaged in normal activities. The receiver picks up the signals and presents them on a television-type screen.

Usually electrocardiograms (records of heart activity) are recorded on photographic film. In a paper presented at the 1951 National Electronics conference, held in Chicago in October, James L. Murphy and Hilary W. Pavela, of the Armour Research foundation, announced a method for magnetically recording on tape the tiny electrical impulses originating in the muscles of the body. This was an adaptation of the tape recorder used for sound recordings. The new device was developed in a project for the University of Illinois, Urbana, and at the close of the year was in use in the university hospital.

A film record must be developed before it is available for study, but that on tape can be used immediately. In addition, it was said to be considerably more economical. Another useful feature is that the amplifier and recorder are of the "dual channel" type. This enables the scientists to record the electrical impulses and also, if they wish, a simultaneous spoken commentary describing what the subject is doing to produce the variations in voltage. The impulses range from about 30-millionths to three-thousandths of a volt, and are fed into a preamplifier which increases their strength about 20,000 times before they go into the amplifier proper.

A method of utilizing television techniques to extend the range, power and adaptability of the light microscope was announced by A. K. Parpart, chairman of the department of biology at Princeton university. It was developed with the cooperation of L. E. Flory and J. M. Morgan, of the laboratories division of the Radio Corporation of America.

The experimental installation was used primarily by Parpart at the Marine Biological laboratory, Woods Hole, Mass., in studying a wide variety of marine life. It consists of a laboratory microscope mounted beneath an RCA industrial television camera, about the size of a small 16-mm. motion picture camera, from which the picture is transmitted by cable to a standard receiver. The camera pickup tube, called a Vidicon, can be made sensitive only to a particular narrow band of colour. A red-sensitive and a violet-sensitive tube were used by Parpart. In some cases he employed a binocular microscope with a camera above each of the two eyepieces, and connected to two receivers. Thus simultaneous red and violet images could be examined side by side.

Using a single narrow band of colour, it was explained, it is possible to study in a living cell a particular material whose light absorption lies in that band, giving a degree of contrast between various chemical components of the cell that is superior to methods formerly used. These involved photographing through colour filters. Frequently the specimen had to be stained, a process which might kill it. In addition to the tubes for red and violet, others were under development which would extend the range of the microscope's vision into the invisible ultraviolet and infra-red regions.

The velocity of light, whose symbol is C, is one of the most important fundamental constants of nature, and a Stanford university (Calif.) physicist, Edward Ginzton, announced that electronic means had been used to determine its value with what was believed to be 10 to 20 times the precision of former methods. The speed was given as 186,280 mi. per second, compared with 186,272 mi. per second, considered the best previous value.

The new determination was estimated to be accurate to within 0.0002%.

Instead of visible light, radio microwaves a few inches long were used. These, like light and all forms of electromagnetic radiation, are known to travel at the same speed.

Just as sound from a tuning fork is greatly reinforced when it is held over a tube of such a length that the natural pitch of the tube corresponds to that of the fork, so a resonant cavity for radio waves can be constructed. It will resonate for waves of a particular length, but not for others. The wave length multiplied by the resonant frequency gives the speed of light. The cavity used in the new experiments was a cylinder 4.5 in. high and 9.8 in. in diameter. William W. Hansen, former professor of physics at Stanford, was credited with originating this technique.

The major part of the research, which took more than five years, was performed by Kees Bol and William J. Barclay. It was sponsored by the Sperry Gyroscope company.

The year 1951 saw the inauguration of a new and extremely precise master timekeeper in the Bell Telephone laboratories at Murray Hill, N.J. This was expected to vary less than a ten-thousandth of a second per day, which corresponds to a precision of a second in 30 years. The timekeeper was known as the Bell System Primary Standard of Frequency, and was used as a yardstick for precise measurement of time and frequency throughout the Bell system.

At the heart of the standard are four quartz crystals which are excited electrically to vibrate at 100,000 cycles per second. These vibrations, through circuits containing 600 electron tubes, control the frequency of a special alternating electrical current with a precision of 1 part in 1,000,000,000. The crystals, each about the size of a book of paper matches, are enclosed in containers from which air has been evacuated and then are maintained at a temperature constant to within a hundredth of a degree. The entire equipment is housed in air-conditioned rooms where the temperature never varies more than two degrees. The new frequency standard was said to be about ten times as precise as its predecessor, which operated similarly and had been in operation since 1937 at the New York headquarters of the Bell laboratories.

A shore-based radar and marine radiotelephone system to guide ships into the harbour even in dense fog was installed by the General Electric company at Los Angeles. In use, during such bad weather, the harbour radar operator locates the position of a vessel approaching the breakwater entrance, as well as of the pilot boat, with the harbour pilot aboard. Thus the pilot is guided to the incoming vessel, which he boards, carrying with him a portable "walkie-talkie" set, over which he can continue to talk with the radar operator on land. The shore operator advises the harbour pilot of marker buoys, beacons and other boats and ships, so as to avoid a collision, thus guiding him to the entrance and finally through the channel to the vessel's berth.

Another harbour radar system, designed and built by the Raytheon Manufacturing company to guide vessels in fog at the port of Le Havre in France, was tested in July on Deer Island in Boston harbour. A rotating antenna 41 ft. wide and weighing about five tons sends out the narrow radio beam which sweeps around the harbour and echoes back when it encounters a ship. Positions of ships are shown on the 16-in. diameter face of a tube similar to that in a television set. Four such indicators were used in the test, each showing a part of the harbour or the channel.

Another feature of the installation was a radio microwave relay link to transmit the radar information to a remote point, namely Boston's Commonwealth pier. On a standard indicator at the pier it was possible to see the picture then being displayed on any of the indicators on Deer Island. A possible use of such transmission, similar to that used in network television, was seen in a complicated harbour, where a chain of radar stations might be tied together for control of traffic under conditions of low visibility.

In October the General Electric company announced completion of a U.S. air force order for the largest and most complex radar systems yet produced. A number of these had been installed by the air force as major units of the radar "fence" protecting the U.S. and Canada against unexpected enemy air attack. Installations in the arctic regions were housed in rubberized fabric balloons, 54 ft. in diameter and 36 ft. high supported entirely by air pressure and capable of withstanding winds of 125 m.p.h.

Minute cracks in gun barrels, or other iron or steel tubes, can be quickly detected and plotted with a device developed by R. D. Kodis, formerly of the Watertown, Mass., arsenal, and R. Shaw, of the Graydon Smith Products company. An electric current through the barrel magnetizes it, and if it is perfect the magnetic field would be uniform all around. Cracks and other defects cause a distortion of the field. On a "crawler," which is pulled through the barrel by a chain at a speed of as much as six feet per minute, is a pickup coil that spins around, close to the bore of the gun, as fast as 1,800 r.p.m. This detects the irregularities of the magnetic field and a visible record is made on a strip of paper. When complete the record shows the defects as dark markings, as if the inside surface of the barrel were laid out flat.

Any combination of musical sounds, including many that cannot be played on any conventional instrument, can be made real with an electronic music box demonstrated to the National Electronics conference by Earle L. Kent, director of research for C. G. Conn, Ltd. He said that the device, which consists of a box with a panel of knobs and switches, would probably be of value to composers and arrangers, since any musical idea may be translated directly into music without the restrictions and limitations of ordinary instruments.

A new amplifying device, called the junction transistor, was announced by the Bell Telephone laboratories, who credited William Shockley with its development. It had the form of a bead about 3/16 in. in diameter with three wires extending from it and was capable of amplifying a weak electrical signal about 100,000 times. The smallest electron tube of the usual type that would perform the same job would be about 400 times as big. In addition, even though the original signal might have a power of as little as a millionth of a watt, a full watt of power is ordinarily required to amplify it in a conventional tube. The junction transistor, it was stated, would itself operate on about a millionth of a watt.

The heart of the junction transistor is a tiny rod of germanium, an element belonging to the class of materials known as semiconductors. The rod is treated so that both ends are electrically negative, with a thin positive layer sandwiched between them. The two junctions between the middle layer and the ends give the device its name. The entire rod is encased in a plastic bead, with wires from each of the three regions extending outside.

An electron tube of ceramic material instead of the usual glass, capable of producing radio waves about a foot in length and with power of one kilowatt, was announced by the General Electric company's electronics department. The first ceramic tube of its kind to operate at such power, it was intended for use in television transmitters in the new ultrahigh-frequency range. Though the Federal Communications commission had not opened up these bands for general use by the close of 1951, it was expected that when this was done they would greatly increase the possible number of television stations.

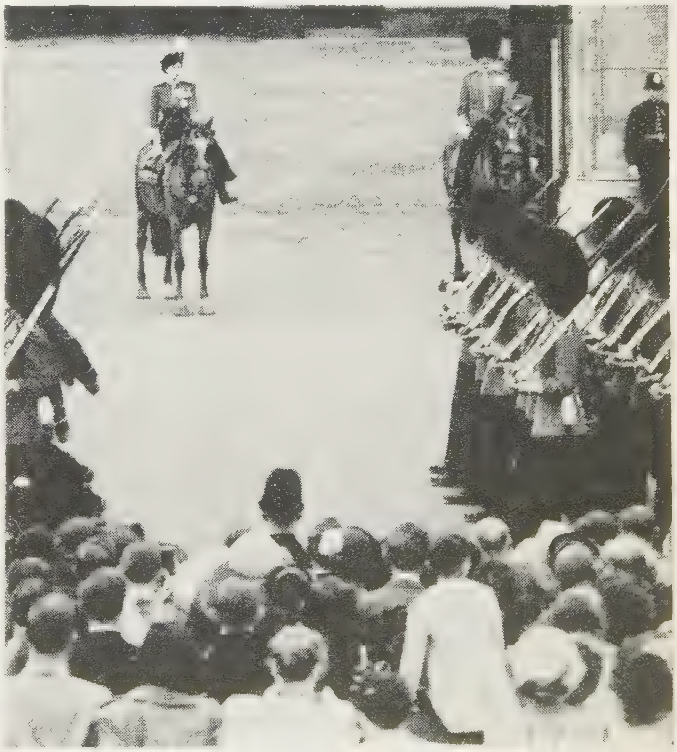
Elementary Education: *see* EDUCATION.

Elizabeth, (1926–), British queen, was born at London, on April 21. She was married on Nov. 20, 1947, to Prince Philip, duke of Edinburgh, and on Nov. 14, 1948, gave birth to a son, Prince Charles Philip Arthur George. A daughter was born to the royal couple on Aug. 15, 1950, and christened Anne Elizabeth Alice Louise.

On April 11, 1951, she and the duke went to Rome for a two-week private visit during which they were received by Pope Pius XII. During the illness of George VI (*q.v.*) she deputized for him on a number of occasions.

Elizabeth and the duke of Edinburgh left by air on Oct. 8 for a tour of Canada, arriving at Montreal the same day (*see* CANADA). They returned on Nov. 17 and drove through the streets of London by an extended route to Buckingham palace. On Sept. 29 Elizabeth had been made a member of the council of state which was to relieve the king of many of his



ELIZABETH representing King George VI during his illness in 1951. She is shown in her uniform of colonel of the Grenadier Guards as she left for the Trooping the Colour ceremony in London on June 7 formal duties after his operation and, on Oct. 9, it was announced that she and the duke of Edinburgh would carry out the tour of Australia and New Zealand the king had hoped to undertake in 1952. On the first stage of this tour, at Kenya, Africa, Elizabeth learned of the death of her father, Feb. 6, 1952. She returned by air to London and took the oath of accession as Queen Elizabeth II on Feb. 8, 1952.

Employment.

United States.—The civilian labour force (persons not in the armed forces and available for employment) numbered 64,208,000 in Aug. 1951, which represented a decline of 659,000 from Aug. 1950. (Data on the net strength of the armed forces and total labour force were not available after Jan. 1951.) Coupled with this decline in the civilian labour force was a decrease in unemployment, the Aug. 1951 total of 1,578,000 being 922,000 less than the Aug. 1950 total of 2,500,000.

Table I.—*Number of Employees in Nonagricultural Establishments, by Industry Division, United States**

(In thousands)

Industry division	Aug. 1951	July 1951	June 1951	Aug. 1950
Total estimated employment	46,670	46,436	46,559	45,080
Mining	926	907	925	950
Contract construction	2,796	2,749	2,687	2,629
Manufacturing	15,970	15,829	15,950	15,450
Transportation and public utilities	4,195	4,180	4,159	4,120
Trade	9,627	9,657	9,733	9,474
Finance	1,914	1,907	1,893	1,837
Service	4,842	4,851	4,835	4,827
Government	6,400	6,356	6,377	5,793

*The estimates include all full- and part-time employees in private nonagricultural establishments who worked during, or received pay for, the pay period ending nearest the 15th of the month. Proprietors, self-employed persons, domestic servants and personnel of the armed forces are excluded. These employment series have been adjusted to levels indicated by social-insurance programs data for 1947 and have been carried forward from 1947 bench-mark levels.

Source: United States Bureau of Labor Statistics, *Monthly Labor Review.*

Males in the civilian labour force declined from 45,818,000 in Aug. 1950 to 44,720,000 in Aug. 1951. This decline of more than 1,000,000 was a direct result of the build-up of the armed forces following the outbreak of the Korean war. The number of civilian unemployed males in Aug. 1951 was 956,000, a decrease of 708,000 from Aug. 1950.

Table II.—*Employees in Manufacturing, by Major Industry Groups, United States*

(In thousands)

Industry Group	Aug. 1951	July 1951	June 1951	Aug. 1950	Net Change Aug. 1950 to Aug. 1951
All manufacturing	15,970	15,829	15,950	15,450	+520
Durable goods	8,900	8,855	8,996	8,294	+606

1951 "	159.4 (8 mo.)	430.2 (7 mo.)

*Data have been adjusted to levels indicated by social-insurance programs for 1947 and have been carried forward from 1947 bench-mark levels.

Source: United States Bureau of Labor Statistics, *Monthly Labor Review.*

Females in the civilian labour force totalled 19,488,000 in Aug. 1951, representing an increase of 439,000 over the Aug. 1950 total of 19,049,000. Unemployment in this classification declined from 836,000 in Aug. 1950 to 622,000 in Aug. 1951.

The number of employees in nonagricultural establishments was 46,670,000 in Aug. 1951, an increase of approximately 1,600,000 from the total for Aug. 1950. During this period every division of nonagricultural employment showed an increase, with the exception of mining, in which the number of employees declined by 24,000. (The largest decline within this division was a 35,000 decrease in the number of employees in the mining of bituminous coal.) The greatest changes occurred in manufacturing, contract construction and trade, where the increases numbered 520,000, 167,000 and 153,000, respectively. These increases were a continuation of the 1950 trend, although the rate of increase had declined in 1951 as full employment was approached.

Most of the increase in employment in manufacturing between Aug. 1950 and Aug. 1951 occurred in the durable goods industries, the increase being greatest in the machinery, transportation equipment and primary metal industries. In the same period employment in the nondurable goods industries declined by 86,000. The increase in employment in some nondurable goods industries (particularly in the chemical industry) was more than offset by the drop in employment in the textile, food and leather industries.

Preliminary figures for Sept. 1951 indicated a continuation of these trends. In this month the number of employees in nonfarm establishments was at an all-time peak of 46,900,000, nearly 1,200,000 higher than a year earlier. With unemployment in September about 300,000 below the previous postwar low for the month, the over-all employment situation continued favourable in the nation as a whole.

Employment in durable goods manufacturing in Sept. 1951 was almost 9,000,000, or 500,000 more than in Sept. 1950.

Employment in nondurable goods manufacturing declined by

APPRENTICE WELDERS training at the Cadillac tank plant in Cleveland, O., in 1951, as defense orders reached U.S. factories in a steadily growing stream

about 40,000 between mid-August and mid-September in contrast to an average August–September increase of 100,000 in the past few years. Employment in the textile, apparel and leather industries was 8% below the Sept. 1950 level, and the lowest for the month since 1945.

The employment and weekly pay-roll indexes for manufacturing industries reflected the continued reversal of the 1949 decline in employment.

The employment index for manufacturing industries increased from 149.7 in 1950 to 159.4 for the first eight months of 1951. For the same industries the weekly pay-roll index for the first seven months of 1951 was 430.2 as compared with the 1950 value of 371.7.

The expanded rearmament program continued to be the major factor affecting employment and wage structures.

In Jan. 1951 a national manpower mobilization policy was promulgated by the president. Following this, the Wage Stabilization board ordered a general ceiling on wage increases, later followed by a series of orders relaxing the "freeze" for various groups of wage earners. A new wage policy was formulated by the board in Aug. 1951 whereby all workers, both organized and unorganized, might receive wage adjustments related to changes in the cost of living.

Canada.—The civilian labour force increased from 4,933,000 in July 1950 to 5,332,000 in July 1951, while for the same dates unemployment changed from 140,000 to 85,000. This increase in employment was reflected in the general employment index (1939=100) which rose to 183.4 as of July 1, 1951, as compared with a value of 170.8 for July 1, 1950. The Canadian index value for employment in manufacturing (1939=100) was 177.5 in 1950 and averaged 189 for the first eight months of 1951.

Great Britain.—On Aug. 31, 1951, the total working population of Great Britain (analogous to the labour force in the United States) was 23,449,000, which represented an increase of approximately 100,000 from the 1950 total for that date. The total working population of Aug. 31, 1951, was composed of: 22,402,000 in civil employment; 835,000 in the armed forces and women's services; 205,000 registered unemployed; and 7,000 men and women on release leave who had not yet taken up employment.

During the first eight months of 1951, civilian employment increased by 302,000, with every industry or service category participating in this increase with the exception of the textile industry, employment in the latter having declined slightly. The largest increases during this period were in agriculture and fishing; metals, engineering and vehicles; building and contracting; and miscellaneous services.

Australia.—The general employment index (July 1939=100), excluding agriculture but including forestry and fishing, was 147.1 for 1950 and averaged 151.3 through June 1951. Employment in manufacturing (1937=100) was 169.6 for 1950 and 173.5 for the first six months of 1951.

Chile.—Excluding salaried employees, the manufacturing index (1937=100) for Chile averaged 126.2 for January through May 1951, which was below the 1950 value of 134.3.

France.—The general employment index for France (excluding agriculture) was 110.0 for 1950, and for the first five months of 1951 this index value had risen to 111.2 (1937=100). Using the same base year, the index of employment in manufacturing had a value of 116 for the January through May period, 1951, as compared with a 1950 value of 113.6.

Japan.—With Oct. 1947=100, the general employment index (excluding agriculture) was 105.1 in 1950 and 114.5 for the first five months of 1951. The index for employment in manufacturing (July 1950=100) was 111.2 in Dec. 1950, and averaged 114.2 for the first four months of 1951.

Norway.—On the basis of an index including all nonagricultural employment (1949=100) the general employment index was at 102.3 for 1950 and 102.5 for the first five months of 1951. An index of employment in manufacturing (1949=100) had a value of 102.6 in 1950 and 105.1 in 1951 (January–May).

Union of South Africa.—In 1950 the general employment index (1937=100, and excluding agriculture and commerce) was

136.7 and for the first six months of 1951 averaged 139.1. Based on 1937 = 100, the index of employment in manufacturing was 161.0 in 1950 and 168.8 for the first six months of 1951.

West Germany.—In 1950 the general employment index (June 1948 = 100) was 107.3, and increased to 110.8 for the five-month period beginning in Jan. 1951. The index for employment in manufacturing (June 1948 = 100) was 118.0 in 1950 and 125.1 in 1951 (five months). (*See* also BUSINESS REVIEW; CENSUS DATA, U.S.) (P. TA.)

Endocrinology.

The centre of the endocrine stage during 1951 was again occupied by the adrenal cortex. Research in this field reported during the year contributed to a better understanding of the chemical steps by which adrenal steroids are produced in the body, indicated some of the mechanisms by which the gland is stimulated to oversecretion, and partially explained the manner in which the active steroids such as cortisone and compound F (17-hydroxycorticosterone) influence the inflammatory expressions of many diseases.

Perfusion of the isolated, surviving beef adrenal gland (O. Hechter) revealed the following facts about the biological synthesis of the adrenal hormones: the parent substance is cholesterol, which the gland can synthesize from acetic acid. Under the stimulus of ACTH (adrenocorticotropic hormone) the adrenal cell changes cholesterol to pregnenolone. The latter steroid is then transformed through successive steps to the biological end products, which are compound F and compound B (corticosterone). Both of these steroids are active in restoring to normal the metabolism of foodstuffs and of electrolytes in the adrenal deficient animal. The perfused glands have a high capacity for steroid manufacture, which is in agreement with previous observations that under stress the adrenal delivers comparatively huge amounts of active steroids to the tissues.

The means by which the anterior pituitary gland is signalled to increase its output of ACTH during stress had not been completely elucidated. The work of the year made it appear likely that more than one type of signal is used (G. Sayers). There seemed no doubt that whenever the circulating level of adrenal cortical hormones falls, ACTH is liberated, and by its action on the adrenal serves to bring back the level to a normal value. This type of homoeostatic mechanism accounts for many of the adjustments observed, but not for all. Evidence had accumulated to show that adrenaline can evoke ACTH secretion by a direct effect on the pituitary gland, and that stimulation of the central nervous system (even in the absence of the adrenal medulla) leads to increased adrenal cortical secretion.

During the past few years the great number of experimental and clinical studies dealing with the effects of ACTH and cortisone upon inflammatory phenomena under various conditions inevitably led to some initial confusion and contradiction in interpretation. However, during 1951, a large number of observations were correlated and it became possible to establish a more unified concept of the mode of action of these hormones. The anti-inflammatory effect seems to be nonspecific, *i.e.*, equally exerted whether the inflammatory agent be a living bacterium, a nonliving protein antibody or a simple chemical irritant. The tissue elements which are acted upon are the small blood vessels (capillaries, arterioles, venules), the fibroblast cells and the materials produced by them (ground substance, fibres). The C_{11}-oxysteroids, *e.g.*, cortisone, modify the response of the small blood vessels to drugs, and prevent damage to the endothelial cells lining such blood vessels. The proliferation of fibroblasts which follows tissue irritation is sharply reduced as is also the outgrowth of new capillaries. These actions were shown to be exerted locally upon the lesion and not through the mediation of a special organ or of some general bodily response. Most workers in the field agreed that cortisone does not interfere with the formation of antibodies or with their fixation to a sensitized group of cells. It does inhibit the usual inflammatory reaction of the connective tissue elements to the fixed antibody.

Anterior Pituitary.—Diabetes insipidus is a disorder of water excretion caused by a deficiency of antidiuretic hormone (A.D.H.), secreted by the posterior pituitary gland. The kidney becomes unable to hold back water efficiently, and the result is a urinary volume which may reach 15–20 litres per day. It had been known for many years that an activity of the anterior pituitary was also involved in this disorder, because damage to both parts of the pituitary gland did not result in diabetes insipidus. During 1951 it was shown that the growth hormone or a factor associated with it acts in an opposite fashion to A.D.H. It promotes the excretion of water. It became evident that the regulation of body water is complex and that at least three hormonal factors are involved: A.D.H., growth hormone and the adrenal cortical steroids.

Thyroid.—Long before 1951 the observation had been made that the cells of a small area of the midbrain seemed to concentrate iodine. No explanation for this phenomenon was forthcoming. During 1951 D. E. Clark and his co-workers studied the problem with the use of isotopic iodine (I^{131}). They found that there was no particular concentrating capacity for inorganic iodine in any part of the brain. However, thyroxine (possessing isotopic iodine) accumulated in certain areas of the midbrain. This work served to stimulate interest in two aspects of thyroid physiology: the well-known effects of thyroxine on the autonomic aspects of brain function, and the equally well-established effects of central nervous stimulation on the rate of thyroid function. It began to appear that both of these aspects might have their seat of action in the midbrain. (RA. L.; S. SO.)

English Literature.

In English writing in 1951 intelligence, industry and ability were applied in good measure, but that extra *élan* needed to lift the writer's prose above the level of mediocrity was too seldom evident. The predicaments of the times were much in writers' minds. E. M. Forster's occasional pieces had long stimulated a desire for a new large-scale work from his pen. This did not seem to be forthcoming, but some consolation was to be derived from *Two Cheers for Democracy,* a stimulating collection of essays, lectures and broadcasts on political and aesthetic themes which reflected an alive, creative intellect.

Bertrand Russell, in his *New Hopes for a Changing World,* made a plea for courage to overcome and discard obsolete fears and hatreds which had brought oppressive gloom instead of the happiness that modern knowledge and skill rendered possible.

From the time of *The Great Illusion* (1910) onward Sir Norman Angell had campaigned for sane political thinking, and this appeal to reason was reiterated in his autobiography, *After All,* which gave, too, a full account of the vicissitudes of a life spent largely in the cause of peace and service of others. The dangers which Charles Morgan believed threatened the mind and spirit of man were examined in *Liberties of the Mind,* a collection of essays; while *The Estate of Man,* the last work of Michael Roberts, poet, philosopher and teacher, was an inquiry into "the limits of man's capacity to adapt himself to the conditions which he has helped to create."

Something of Stephen Spender's efforts to adapt himself to his times, his private and public life and his political preoccupations and personal friendships were described in *World Within World;* and the second part of Freya Stark's autobiography, *Beyond Euphrates,* concerned with the years 1928–33, illuminated the author's thoughts and beliefs, as well as her life in Baghdad, Iraq, and travels in Persia (Iran) and other lands.

A group of royal portraits ranged from the duke of Windsor's memoirs, *A King's Story,* and Lord Sysonby's impressions of court life with Queen Victoria, King Edward VII and King George V, *Recollections of Three Reigns,* to Dorothy Margaret Stuart's study of Princess Charlotte of Wales and her family, *Daughter of England,* and A. Aspinall's edition of the unpublished correspondence of Mrs. Jordan and the duke of Clarence, later King William IV, *Mrs. Jordan and Her Family.*

Steven Runciman presented, in the opening volume of *A History of the Crusades,* a political and military narrative of the first crusade. Austin Lane Poole's *From Domesday Book to Magna Carta,* a scholarly volume in the "Oxford History of England," concentrated on documentation and facts, and was a valuable contribution to the study of one of the most remarkable passages in English history.

The changes brought about in Great Britain's international position between 1830 and 1841 were surveyed in Sir Charles Webster's two volumes on *The Foreign Policy of Palmerston,* and rewarding studies of more recent statesmen and politicians included the fourth volume of *The Life of Joseph Chamberlain* (1901–03), written by Julian Amery, who undertook completion of the task after the death of J. L. Garvin; Thomas Jones's satisfying "interim, unofficial" portrait, *Lloyd George,* based on his own intimate acquaintance with affairs and with the former prime minister; *The Life of George Lansbury,* by Raymond Postgate; and *The Last of the Radicals,* Cicely V. Wedgwood's biography of her uncle, Josiah Wedgwood.

While Winston Churchill was continuing his story of World War II—the fourth volume, *The Hinge of Fate,* was devoted to Jan. 1942–June 1943—biographies of two kindred spirits, fighting admirals of World War I, whose talents Churchill recognized when first lord of the admiralty, were being completed. *The Life and Letters of David, Earl Beatty* was authoritatively written by Rear Adm. W. S. Chalmers; the career of Roger Keyes was ably and affectionately recorded by General Aspinall-Oglander.

Two important works on literary and linguistic criticism were John William Hey Atkins' *English Literary Criticism: The 17th and 18th Centuries* and William Empson's brilliant *The Structure of Complex Words,* which was a worthy successor to his *Seven Types of Ambiguity* (1947). (A. Ck.)

Fiction.—During 1951 most of the leading novelists produced work of some kind, if not, in some cases, their best. Foremost among them was Ivy Compton-Burnett whose characters in her new novel *Darkness and Day,* from rebellious bootboy to tragipathetic children, were ruthlessly and superhumanly articulate as ever and haunted, as in all her books, by the menacing but always mentionable sins of the fathers.

Graham Greene's preoccupation with sin and sex was dispiriting, if cathartic, in *The End of the Affair;* physical passion was brilliantly conveyed in a guilt-ridden tale of adultery that ended with minor miracles. It could be objected that the submergence of personality through lust, though convincing, made of its hero something less than a man.

The Masters by Charles P. Snow was an erudite and tense tale of college politics and Machiavellian dons, although Snow's avowed aim to follow his hero through the differing strata of English life was perhaps more sociological than literary. Charles Morgan's *A Breeze of Morning* was a tale of subtly differentiated shades of love and longing told urbanely, at times poetically, against the background of a classical education. In the same tradition was Anthony Powell's slight but civilized autobiographical novel *A Question of Upbringing.* In *A Way through the Wood* Nigel Balchin's treatment of the theme of adultery was somewhat similar to Graham Greene's, with, characteristically, more stress on psychology than religion. William Sansom in *The Face of Innocence* gave, less convincingly, the case history of a tiresome female psychopath. Francis King's *The Dividing Stream* saw the return of the unspoiled child of nature. *My Fellow Devils,* a new work by L. P. Hartley, and Victor S. Pritchett's *Mr. Beluncle* were published toward the end of the year.

Among historical novels Lord Belhaven's *The Eagle and the Sun,* an inspiring account of the march of the 10th legion into Arabia in the time of Augustus, was well-documented and written in soldierly, if sometimes overdisciplined prose. John Cowper Powys' *Porius* was a vast, shrouded chronicle of the time of King Arthur. Of the semidocumentary novels of contemporary history Robert Harling's *The Paper Palace* and, in the thriller class, Eric Ambler's *Judgment on Deltchev* were outstanding. Of the war novels the greatest demand was for Nicholas Monsarrat's *The Cruel Sea.* Robin Maugham showed signs of family talent in *The Rough and the Smooth,* a well-planned if somewhat uneven story of a tawdry *femme fatale.* Anthony West in *Another Kind* proved himself to be a more mature and sophisticated writer, but this, his second novel, was overambitious.

In 1951 few collections of short stories called for special comment. The most noted event was probably the publication in three volumes of W. Somerset Maugham's collected tales. Herbert E. Bates's stories in *Colonel Julian* seemed at times mechanical. Compassion for the underdog was vitiated in some of them by a stultifying bitterness. Noel Coward's *contes* in *Star Quality* were typical—rather dated, a little like nostalgic gramophone records. The theme throughout Denton Welch's posthumous *A Last Sheaf* was the plight of the sensitive, even soft, individual in a hard world. In novels and short stories alike there was less satire than in the previous year. Preoccupation with sex could be seen as an escape through the senses from a world that was viewed, sometimes with perplexity, sometimes with compassion, often with despair. Apathy rather than stoicism set the literary mood. Heroes were notably unheroic. Helen, not Penelope, was the woman of the year. (L. Ps.)

Poetry.—The year 1951 was not outstanding in English poetry. The Arts council of Great Britain instituted a poetry competition for narrative and lyric poems to be judged by a panel of university dons and, perhaps for this reason, few established poets competed. The winning entries did not discover any remarkable new young talent, unless it was that of Robert Conquest, one of the lyric winners. These poems were published by Penguin Books.

The Hand and Flower Press and the Latin Press produced works of taste and promise by poets whose names were unfamiliar to the public; *e.g.,* Thomas Caddick and Guido Morris.

Of the older, established poets, Walter de la Mare published a long poem, *Winged Chariot,* on the subject of time, full of the felicities of his unique talent; Robert Graves, in his *Poems and Satires 1951,* did not add greatly to his reputation. Perhaps the most remarkable publication of the year was *The Collected Poems of Keith Douglas,* a young writer of great promise killed in Normandy in 1944.

The *Selected Poems* of the American poet Richard Eberhart gave English readers a new insight into one of the most original poets writing, and the *Collected Poems* of Marianne Moore emphasized the preciosity of much that had been labelled modern in the previous 25 years. *Poems 1938–49* introduced to English readers another young American poet of promise, Robert Lowell. *The Poems of C. P. Cavafy,* the Greek poet, translated by John Mavrogordato, were compared with those of W. B. Yeats as being some of the most beautiful the 20th century had produced.

Among books by women writers, *One is One,* a new collection by Mrs. P. D. Cummins, was noteworthy for its expression of the pain and grief of existence. In *The Golden Bird,* Anne Ridler forsook her domestic variations for fairy tale, not entirely unsuccessfully. In her heroic poem, *Gods with Stainless Ears,* Lynette Roberts produced a work of eccentric brilliance.

The activities of those bodies concerned with presenting poetry to the public orally were continued. The British Broadcasting corporation produced a new translation by C. Day Lewis of Virgil's *Aeneid.* Many lesser readings were given by the P.E.N., the National Book league and the Apollo society. The British council, in collaboration with the Gramophone company, continued to present its issues of recorded classics. Epidemics and Public Health Services.

Five diseases remained subject to international quarantine in 1951: cholera, plague, typhus, smallpox and yellow fever. Information from countries in the Communist orbit was scanty, but reports from the rest of the world indicated little change in the prevalence of these five pestilences during the year. India remained a prime focus of cholera. Plague still prevailed in Asia, Africa and South America. Plague in man was rare in the United States, although the disease was firmly established in wild rodents in the western states. Ordinarily there is little smallpox in western Europe and in English-speaking countries because vaccination is widely practised. In communities where vaccination is not rigidly kept up, however, local outbreaks can occur. This was illustrated in 1951 by outbreaks in Brighton, Eng. and in the Netherlands and Portugal. Epidemic typhus prevailed in parts of Asia, Africa, South America and eastern Europe.

Yellow fever was still confined to Africa and to Central and South America. Strenuous efforts had been made to control the disease in the Americas by vaccinating populations and by suppressing the *Aedes aegypti* mosquito, the vector of yellow fever in urban areas. However, jungle yellow fever could not be eradicated by existing methods because the main reservoir, monkeys, obviously could not be attacked effectively, nor could the jungle mosquito vector, the *Haemogogus,* be eradicated. Jungle yellow fever spread slowly northward. Panamá was invaded in 1948, and by 1951 the disease had reached Costa Rica, where a number of deaths occurred despite the introduction of mass vaccination.

Other diseases which were still of world-wide importance in 1951 were influenza and malaria. In 1918 influenza was a pandemic and highly fatal disease. Epidemics occurred repeatedly thereafter but did not show the same lethality, which in 1918 was strikingly manifest in healthy young adults. Although the virus causing the 1918 disease was never isolated, agents of subsequent epidemics were well studied. It became known that at least two types of influenza virus exist, A and B, and that the A has many subtypes which differ markedly so that vaccines lacking the strain which causes the epidemic may not protect against infection. The World Influenza centre collected information on the dissemination of the disease and the strain of the causative virus.

The 1951 epidemic of influenza was widespread. Apparently it spread from focuses existing in 1950 in Scandinavia, Northern Ireland and Spain. Parts of Ireland, western Europe, Great Britain, northern Africa, the Balkans, the near east, the Americas, some Pacific islands and Japan were affected. By far the most frequent offender isolated was an A prime virus similar to that causing the 1950 epidemics. The similarity of the strains of virus isolated in 1951, in view of the mutability previously shown by this agent, supported the hypothesis that the pandemic spread from the three focuses mentioned and was not a spontaneous upspringing in many countries. The rapid isolation and identification of the virus in many countries showed that, if necessary, a vaccine could be prepared in time to protect large segments of the population. This might be necessary if the 1918 type of influenza recurred. However, the influenza of 1951 was still a mild disease, and mass immunization was not necessary. True, in certain areas many deaths occurred, principally in people aged 55 or more, but the sulfonamides and antibiotics prevented or cured many complications which are the principal causes of death.

Rapid progress in the eradication of malaria was due chiefly to the spraying of habitations with residual DDT—a practice which the World Health organization had stimulated. Greece, Sardinia and Corsica were almost free of the disease by 1951, but intensive spraying failed to suppress it in Sicily because the vector there (*Anopheles superpectus*) showed no special preference for houses. Malaria was no longer a public health problem in Argentina and Italy.

Antimalarial projects were in progress in 1951 on all continents. It was claimed that a secondary result of attempts to eradicate the malarial mosquitoes was a reduction in other diseases borne by insects—urban yellow fever, dengue fever, plague and others.

Malaria in the United States, formerly widespread, decreased rapidly because of the treatment of cases and suppression of the insect vector through efforts of the individual states and the U.S. public health service. Since insects capable of transmitting malaria still existed throughout the United States, the return of Korean veterans suffering relapses of malaria (and thus acting as sources of the disease) raised possibilities that malaria might be re-established. The same situation had occurred in World War II, however, and malaria did not take hold in the country.

The principal focuses of poliomyelitis are North America, the British Isles and Scandinavia. Other countries by 1951 were beginning to experience epidemics for the first time. The pattern, at least in the areas of principal focuses, was formerly one of epidemic years with relative freedom for a few years between each epidemic. Epidemic years were now succeeding each other more rapidly, and there was less of a decline between epidemics. Poliomyelitis likewise had become less exclusively a children's disease.

Other epidemics, made known through the World Health Organization, were numerous but not world-wide. Cerebrospinal meningitis caused many deaths in the Anglo-Egyptian Sudan and in French Equatorial Africa. An outbreak of encephalitis in Murray Valley, Northern Victoria, Austr., was found to be Japanese B encephalitis. Infectious hepatitis attacked one out of every eight of the 4,300 inhabitants of Niué Island in the Cook Islands.

Treponemal diseases chronically afflict great numbers of peoples. Mass attacks on these had been made in Iraq, where the problem was bejel, a form of endemic syphilis, and in Indonesia, Haiti and Thailand, which are debilitated by yaws. The attack consisted of mass treatment with penicillin. Campaigns against typhus were under way in Peru and Afghanistan, against rabies in Israel and against trachoma, a common cause of blindness, in the eastern Mediterranean areas.

The United States had an excellent health record in 1951. Immunization programs could be credited with the decline in diphtheria, whooping cough and smallpox. The incidence of syphilis continued to decrease. Pneumonia, Rocky mountain spotted fever, tularaemia, typhoid and paratyphoid reached low levels. On the other hand, the long decline in scarlet fever and streptococcal sore throat was interrupted by a rise in 1951.

Anthrax ("Woolsorter's disease"), usually an occupational disease as its synonym implies, also increased in 1951. Outbreaks of anthrax in animals occurred in Illinois, Kentucky, Missouri, New Jersey, Nevada, North Dakota and Tennessee.

Measles and meningococcal meningitis also increased. The upward trend in the reporting of acute infectious encephalitis continued in 1951; there were many known causes of this disease, and perhaps others yet to be discovered. Several thousand cases of pleurodynia, thought to be due to Coxsackie virus, were found in Texas.

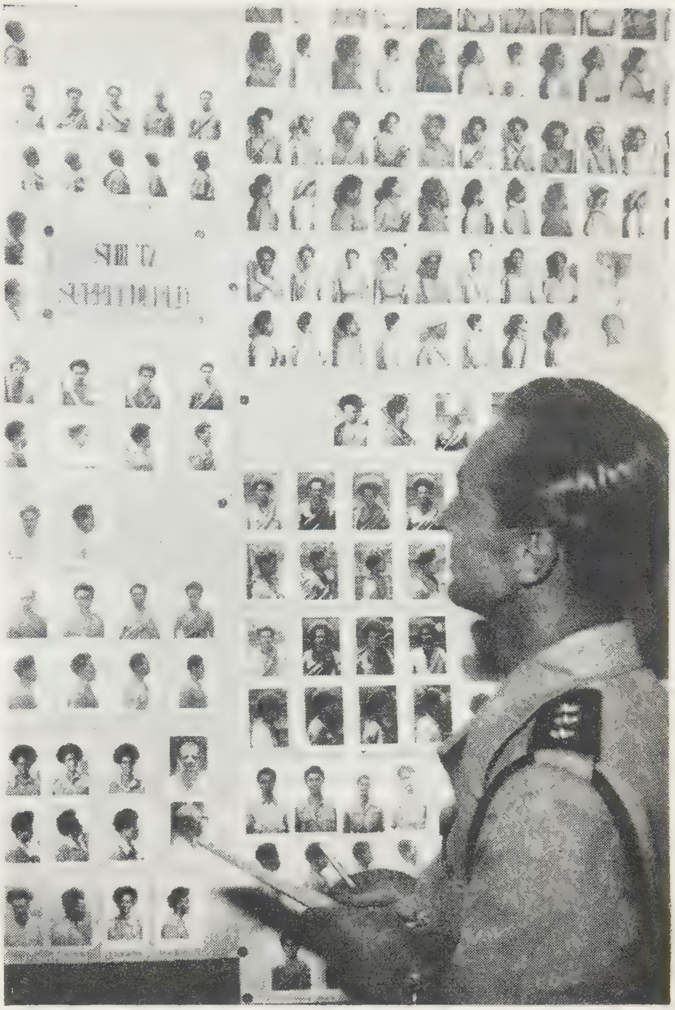
In Korea, the health of the United Nations armed forces during 1951 was good, even though typhus, smallpox and typhoid raged north of the 38th parallel. (*See* also FEDERAL SECURITY AGENCY; INDUSTRIAL HEALTH; MEDICINE; and articles on specific diseases.) (H. E. HI.)

Episcopal Church: *see* PROTESTANT EPISCOPAL CHURCH.

Eritrea.

A former Italian colony on the Red sea, bounded south by Ethiopia and west by Sudan, Eritrea was under temporary British administration from 1941. Area: 47,875 sq.mi. Pop. (1950 est.): 1,100,300 (including 18,000 Italians). Languages: mainly Tigriña and Tigré. Religion: *c.* 50% Christian (Coptic) and 50% Moslem. Capital: Asmara (pop. *c.* 117,000). British chief administrator during 1951: D. C. Cumming.

History.—On Dec. 2, 1950, the U.N. general assembly passed a resolution providing for the federation of Eritrea with Ethiopia before Sept. 15, 1952. Eritrea was to be granted autonomy in domestic matters and the powers to be vested in the federal government were specified. The solution was accepted by all the states concerned. While it did not satisfy the demands of the two major and opposing political factions in Eritrea, one of which, mainly Christian, wanted full union with Ethiopia, and the other of which, mainly Moslem, demanded full independence, it was well received locally. At a public meeting in Asmara all political parties agreed to accept the decision and to co-operate in making it effective. The United Nations commissioner, Eduardo Anze Matienzo (Bolivia), reached Asmara in Feb. 1951, and both he and the British administration were preparing in their separate spheres the measures necessary for federation. These included framing a constitution for consideration by a representative assembly and forming an administration composed of Eritreans. No important visible results had appeared by the end of 1951, but many Eritreans had been brought into the administration to replace foreigners. The commissioner left for the U.N. general assembly in Paris in November.



ROGUES' GALLERY of bandit outlaws who terrorized British-administered Eritrea in 1951. More than 1,000 of them surrendered during a month-long amnesty ending July 18

Although the political parties maintained their acceptance of the federal solution, their activities were directed toward shaping it to meet their respective original aims. The constitution on which this battle would be fought was still being drafted when the year ended.

For the first half of 1951 the state of public security in Eritrea gave cause for alarm. Numerous gangs of *shifta* (bandits) roamed the land and committed outrages and acts of lawlessness. All traffic by road and rail had to be controlled and restricted. It seemed likely that this state of insecurity would hamper the carrying out of federation. A new approach was inevitable and in June a general amnesty was proclaimed for all *shifta,* whatever their crimes; a proclamation giving the chief administrator stronger and more summary powers to combat lawlessness was enacted. These measures were successful. About 1,300 *shifta,* including practically all the known leaders, surrendered and returned to a more settled life. The new security measures were vigorously applied and the inhabitants showed co-operation in enforcing them against subsequent offenders. The Ethiopian government gave full co-operation in frontier control to prevent "border hopping," and brigandage was reduced to negligible proportions.

An agreement was reached between the Ethiopian and Italian governments to resume diplomatic relations.

(F. E. ST.)

Economy and Finance.—Budget (July 1, 1949—March 31, 1950, actual): balanced by contribution from Great Britain as administering power at £2,950,597. Foreign trade (1950, recorded value): imports £4,089,620; exports £2,919,792. Roads (1950, maintained): 780 mi. Railways (1950): 193 mi. Ships entered at Massawa (1950): 773,828 net registered tons.

Estonia. From Feb. 24, 1918, to Aug. 6, 1940, when it was annexed by the U.S.S.R., Estonia, one of the Baltic states of northeastern Europe, was an independent republic. Area: 18,357 sq.mi. Pop.: (1939 est.) 1,134,000; (1950 est.) 1,200,000, but according to reliable estimates the purely Estonian population declined from 998,000 (88%) to 684,000 (57%) between 1940 and 1950. Language: Estonian and Russian. Religion: Lutheran and Greek Orthodox. Chief towns (pop., 1939 est.): Tallinn (cap., 146,400), Tartu (60,100), Kohtla-Järve (1950 est., 30,000). Chairman of the presidium of the supreme soviet of the Estonian S.S.R. in 1951: August M. Jakobson; chairmen of the council of ministers: Arnold T. Veimer and (from March 29, 1951) Aleksey Müürisepp.

History.—On Feb. 25, 1951, the citizens of Estonia "elected" a new supreme soviet. The country was divided into 115 constituencies having each an average of 10,000 inhabitants. Out of a possible poll of 814,682 votes the total cast was 813,777 (99.89%) and only 1,118 (0.14%) votes were said to have been recorded against the official candidates. At the previous election, in 1947, there were 804,172 electors and 28,003 (3.5%) opposition votes. Only 57 of the 115 members of the new supreme soviet were Estonians, 31 were Russians of Estonian extraction, 26 Russians and one Georgian (Joseph Stalin).

It became known during the year that the principal soviet naval base in the Baltic had been transferred from Leningrad to Tallinn.

On March 29 the supreme soviet relieved of his duties the premier, A. T. Veimer, the only remaining native-born Estonian Communist in the government. His dismissal, however, apparently involved no disgrace, for on March 13 he was awarded the Order of Lenin; he was also elected member of the new presidium of the supreme soviet. Previously unknown in Estonia, Veimer's successor, A. Müürisepp, was first heard of in 1949 on his appointment as deputy premier. Annexation of Estonia by the Soviet Union was followed by unprecedented expansion of bureaucracy. From 9, the number of ministers had risen by 1951 to 28, of whom 22 were either Russians or Russified Estonians. Of 49 deputy ministers, 19 were Russians. Of 146 managers of industrial undertakings 71 were Russians.

The Estonian National council, a central organization of the Estonians in the free world, presided over by August Rei, the last foreign minister of independent Estonia, held its third congress in Stockholm, Swed., on April 29. Oliver A. Peterson, attaché to the U.S. embassy, addressed the congress and said that the struggle of the Estonians in exile had the sympathies of the American people. On June 3 the "Voice of America" added to its programs broadcasts in Estonian. (*See* also LATVIA; LITHUANIA.)

Education.—V. K. Oja, an Estonian deputy to the soviet of nationalities, said in Moscow on March 9, 1951, that there were 20% more pupils in primary and secondary schools than before 1940, four and one-half times more in the technical schools and twice as many in institutions of higher education.

Finance.—Budget (1951 est.): revenue 1,104,500,000 roubles, expenditures 1,094,500,000 roubles.

Industry.—In 1951 oil shale production was estimated at more than 3,000,000 tons, as compared with 1,700,000 tons in 1939. The postwar five-year plan, however, had asked for 8,000,000 tons. (K. SM.)

Etching. The year 1951 manifested continued activity in the various original print mediums by artists all over the world, a natural outcome of the fact that the print, being susceptible to multiple production, is capable of wider distribution than any other form of pictorial art, and also, by its size and comparatively low cost, is available to a far wider public and more suitable for display in the average home than the larger and more costly painting or piece of sculpture. Furthermore, as the most democratic form of art expression, it has since earliest times enjoyed a universal popularity as a medium for the expression of the artist's message, of whatever nature the latter might be.

If fewer graphic artists availed themselves of etching in 1951 than of other creative print techniques such as wood engraving and lithography, it was because the extremely exacting nature of the former had less appeal to the spirit of reaction against discipline so current in all forms of art expression.

The three countries which shared leadership in the field of etching during the year were France, England and the United States. In France the so-called "modern" idiom continued to attract the younger artists, the traditional surviving for the most part in the work of those longer established. Most active in the whole field were Michel Ciry, Gérard Cochet, Albert Decaris, Pierre Dubreuil, Edouard Georg, Joseph Hecht, André Jacquemin, Robert Lotiron, Louis-Joseph Soulas, Suzanne Tourte, Roger Vieillard and Jacques Villon. Many of these engaged in book illustration, although line engraving was the more popular medium for this purpose, while the practice of colour printing was more widespread than in any other country despite the fact that the bitten line had never lent itself with complete success to this use. Many print societies, such as the Peintres-Graveurs Français, exist in France and innumerable exhibitions of etchings—solo, group and general—were held during the year.

Etching had been little affected by the "modern" movement in England, home of traditionalism, and the year 1951 saw no exception to this. Malcolm Osborne, president of the Royal Society of Painter-Etchers and Engravers, and Martin Hardie maintained their long and distinguished careers, other outstanding names being those of Winifred Austen, W. D. Brokman-Davis, John Buckland Wright, Eveleen Buckton, John Farleigh, Henry Moore, John Nicolson, William P. Robins, D. I. Smart, Sara Sproule, Leonard R. Squirrell, Graham Sutherland, C. W. Taylor, Murray M. Tod and Leslie M. Ward.

Throughout the years a truly national school of art had been evolving in the United States, and the year 1951 proved that in its etching this character was clearly reflected. The latter's greatest strength lies in its freshness, vitality, variety of approach and range of emotional quality; its greatest weakness in lack of discipline and a want of technical skill resulting from inadequate facilities for sound training. Among the many etchers who produced significant work the following constituted a representative group, their prints running the gamut from wholly objective to purely abstract: Niels Y. Anderson, Will Barnet, Ture Bengtz, Isabel Bishop, Federico Castellon, John E. Costigan, Stephen Csoka, Ralph Fabri, Ernest Freed, Sue Fuller, Harold C. Geyer, Stanley Hayter, Eugene Higgins, Morris Henry Hobbs, Alfred Hutty, Philip Kappel, Gene Kloss, Armin Landeck, Mauricio Lasansky, Luigi Lucioni, Joseph Margulies, Thomas W. Nason, Kiehl and Xtian Newswanger, Roi Partridge, Andre Racz, Charles B. Rogers, Carl M. Schultheiss and Reynold Weidenaar.

In Canada a group of etchers under the able leadership of Nicholas Hornyansky and the Society of Canadian Painter Etchers maintained the high standard of quality shown in the past.

Italy had produced little of importance in etching since the conclusion of World War I. However, 1951 gave evidence of increasing interest in the bitten line, with Celestino Celestini, Benvenuto Disertori, Valerio Fraschetti and Antonio Music the principal figures.

Etching in Germany was still struggling to emerge from the social, economic and political disruption of the nation following two world wars, and though some traces of the old school still survived and a new one was in process of development, no etching of more than local significance emerged during the year.

No etching of note was done in the Netherlands and Belgium, but the Hungarian artists, Julius Komjáti and Nandor Varga, remained outstanding figures in their fields. Meanwhile Norway, Denmark and Sweden, which had long supported a flourishing Scandinavian school of graphic art, contributed a group of etchers whose work was marked by its vigour and strong national flavour. In 1951 a comprehensive exhibition of Norwegian prints was assembled and sent to the United States. In it the etched work of Sigurd Winge was conspicuous.

Although Switzerland had given the world few etchers of international importance, Maurice Barraud, Hans Erni, Hans Fischer and Max Hunziker published interesting work in 1951. Printmaking in Spain, Mexico and the South American republics was confined largely to woodcut and lithography and little of merit was done in the medium of etching.

FILMS OF 1951.—*How to Make An Etching* (Almanac Films, Inc.); *Joan Miro Makes a Colored Print* (Thomas Bouchard). (J. T. AR.)

Ethiopia. An independent empire of northeastern Africa, Ethiopia is bounded north by Italian Eritrea (from 1941 under British military administration), west by the Anglo-Egyptian Sudan, south by Kenya, southeast by Italian Somaliland and east by British and French Somaliland. Area: *c.* 350,000 sq.mi. Pop. (no census ever taken; 1950 est.): 10,000,000. Language: Amharic, the official language; also Tigriña, Tigré, Galla, Somali, etc. Religion: Christian (Alexandrine) 57%; Moslem 17%; pagan, etc., 26%. Chief towns: Addis Ababa (cap., *c.* 250,000); Harar (*c.* 45,000); Dessie (*c.* 35,000); Diredawa (*c.* 30,000). Ruler: Emperor Haile Selassie I; prime minister: Bitwoded Makonnen Endalkatchou.

History.—The preparations for the incorporation of Eritrea by Sept. 15, 1952, into Ethiopia under the terms of the decision reached by the U.N. General Assembly in Dec. 1950 were well advanced. E. Anze Matienzo (Bolivia), the U.N. commissioner, who established his offices at Asmara, Eritrea, early in 1951, was at the end of the year in Geneva, Switz., drafting the terms of the constitution which he would recommend to the constituent assembly of Eritrea.

The settlement of the future of Eritrea cleared the way for the resumption of diplomatic relations with Italy; and an agreement for this purpose was reached following the visit of the Italian undersecretary of state, Giuseppe Brusasca, early in September.

During the year direct relations were instituted with Yugoslavia, Spain accredited its Cairo minister to Addis Ababa, and Ethiopian ministers took up residence in Brazil, Venezuela and Mexico.

The emperor's adherence to the principles underlying the United Nations was evidenced in practical fashion by the sending of an Ethiopian infantry battalion of 1,158 officers and men to fight in Korea. The battalion, under Col. Kebbede Guebre, arrived at Pusan in May and was in action in August.

The administration of the service of the loans granted by the International Bank for Reconstruction and Development in 1950—$7,500,000 for road construction and maintenance, $3,000,000 for the new Development Bank of Ethiopia and $1,500,000 for telecommunications—was organized. An imperial highways authority was constituted, and work began on the trunk road connecting the capital with the port of Assab and on the important road linking the rich province of Sidamo in the south with the railway. An imperial telecommunications authority was charged with the responsibility of reconditioning the existing land lines. The Development Bank was in being under the direction of Leon Jozef Baranski, formerly a director of the Bank of Poland.

On July 26 a special tribunal in Addis Ababa sentenced eight men, including Bitwoded Negash, a former president of the parliament, to death for plotting to assassinate the emperor and set up a republican regime.

Bishop Basilios was elected archbishop and primate of Ethiopia by the all-Ethiopian synod on Jan. 8. He was the first Ethiopian monk to hold this office. Until then, traditionally, the chief bishop (abuna) was an Egyptian monk appointed by the Coptic Patriarch. He was consecrated to his new post in Cairo on Jan. 14.

Education.—Schools (1949–50): elementary 540, pupils 60,043, teachers 2,008 (including 286 foreign); secondary (1948–49) 15, pupils 1,079 (including 804 in Addis Ababa). There were 228 students abroad, mostly supported by the government.

Finance and Banking.—Budget (1949–50): revenue Eth. $63,300,000, expenditure Eth. $63,200,000. Monetary unit: Ethiopian dollar, with a basic selling exchange rate (Dec. 1951) of Eth. $2.53 to U.S. $1.

Foreign Trade.—(1950–51): Imports Eth. $95,300,000, exports Eth. $111,700,000. Main sources of imports: India 25%; U.K. 13%; U.S. 12%; Italy 9%. Main destinations of exports: Aden 25%; Eritrea 19%; U.S. 13%; French Somaliland 11%. Main imports: cotton piece goods, machinery, sugar and salt. Main exports (1950–51): coffee 50%; hides 18%; cereals and pulses 10%; oilseeds 10%.

Transport and Communications.—Roads: 43,300 mi., of which 11,100 mi. were suitable for motor traffic. Licensed motor vehicles (Dec. 1950): cars 2,500, commercial 1,750. Railways: 486 mi. Air transport (Ethiopian Air Lines, 1951, ten months): miles flown 1,348,000; passenger-miles 13,411,416; freight ton-miles 934,371.

Agriculture.—Coffee production (1949) 115,000 metric tons. Livestock (1949): horses 1,100,000; asses 3,000,000; mules 1,000,000; cattle 18,000,000; sheep 17,000,000; pigs 8,000; goats 11,000,000; camels 2,000,000; chickens 26,000,000.

European Coal and Steel Pool: *see* EUROPEAN UNION.

European Economic Cooperation, Organization for: *see* EUROPEAN RECOVERY PROGRAM.

European Payments Union: *see* EUROPEAN RECOVERY PROGRAM; EXCHANGE CONTROLS AND EXCHANGE RATES; INTERNATIONAL TRADE.

European Recovery Program. While the Organization for European Economic Cooperation (O.E.E.C.) was no longer charged with its former function of allocating U.S. economic aid among the European recipient nations, it continued its program for freeing intra-European trade from quotas and other quantitative restrictions and from bilateralism. By early 1951, 75% of intra-O.E.E.C. trade was carried on without such restrictions, and in February the O.E.E.C. council discussed proposals for reducing quota barriers still further. Any such action was complicated by the continuous rise in prices of raw materials, which began with the outbreak of hostilities in Korea and continued well into 1951. In the O.E.E.C. several governments were sceptical of further removals of quotas unless the United States, Great Britain and France, which had agreed in December to concert measures to regulate the flow and prices of raw materials, first established an equitable basis for sharing them.

In view of inflationary pressures and balance-of-payment difficulties, the council in March felt obliged to postpone any decision concerning a further liberalization of trade. However, a consolidated list of commodities already exempted from quotas was approved by O.E.E.C. on April 8. Six countries—Austria, Denmark, west Germany, Greece, Iceland, Norway—were exempted from full compliance because of currency weaknesses, while Ireland and Turkey reserved approval of the list; after Turkey also received exemption, the consolidated list was declared in force on Aug. 15. On July 20 the O.E.E.C. council had also approved a code for progressive liberalizing of service transactions, such as transportation, brokerage and customs charges, and payment of taxes, commissions and dividends.

During the second half of 1951 the growing impact of rearmament programs and of rising prices of raw materials resulted in a partial retreat from the goal of liberalizing intra-O.E.E.C. trade. On Sept. 25 the O.E.E.C. agreed on joint action to restrict the use of copper in unessential products. In November Great Britain and France reimposed many quota controls on imports, and again limited service, tourist and short-term capital transfers. On Nov. 1 Switzerland and Belgium-Luxembourg also restored bilateral controls over payments. On the other hand, Italy, which had accumulated a large surplus in its intra-O.E.E.C. trade, on Nov. 1 abolished temporarily almost all quotas on goods from the O.E.E.C. area and reduced its customs duties by 10% on O.E.E.C. goods.

Buffeted by raw materials problems, inflationary pressures and the growing burden of rearmament, O.E.E.C. continued to urge co-operative efforts to solve Europe's economic difficulties. On Aug. 29 it urged Europe to increase its total output by 25% over the next five years. It called for increased output of coal, steel, nonferrous metals, electricity, food and housing and for co-operative action to promote selective migration, elimination of unemployment and absorption of refugees. It urged more rapid modernization of methods and equipment, curbs on inflation and a stronger drive for exports, especially to dollar-area markets.

During 1951 O.E.E.C. gave special attention to the problem of developing Europe's overseas dependencies as sources of raw materials within the O.E.E.C. currency area and as markets. A report on investments in overseas territories, with particular reference to Africa south of the Sahara, recommended a ten-year development program of about $8,000,000,000; of this, about $5,000,000,000 would be needed for public programs, such as transportation facilities, while about $3.000,000,000 would go directly into private investment, primarily in extractive industries. Small steps to implement this program were taken in June. The Economic Cooperation administration (ECA) announced a grant of $7,700,000 from its special reserve fund to Great Britain for development of its overseas dependencies, and a grant of $28,000,000 in counterpart funds for development projects in French dependencies, while Belgium received a loan of $15,500,000 for developing the Belgian Congo. These funds were assigned primarily for development of railways, roads and harbours, supplementing much larger investments to be made by the metropolitan countries.

The Korean war and rearmament programs meanwhile had reversed the trend toward a better balance in trade between the United States and the O.E.E.C. area. Whereas the last six months of 1950 had shown a substantial reduction in the surplus by value of United States exports to Europe, and that surplus had been approximately covered by shipments under the ECA and Mutual Defense administration (MDA) nonmilitary programs, the first half of 1951 showed an excess of United States exports amounting to $1,348,600,000, of which only $871,000.000 was offset by nonmilitary shipments under the ECA and MDA programs. Thus the dollar deficit of the O.E.E.C. area remained acute, contrary to earlier estimates.

The O.E.E.C.-sponsored European Payments union (E.P.U.), established July 1, 1950. proved effective in promoting greater freedom of trade and payments within the area, despite inflationary pressures. When the special E.P.U. credit of $120,000,000 to west Germany, granted in Dec. 1950, proved inadequate to surmount the German payments crisis, the E.P.U. and the O.E.E.C. council recommended, in March and April 1951, a series of measures designed to limit German imports, to restrict expansion of credit and to limit speculative stockpiling. On March 30 the E.P.U. board advised west Germany to limit its imports to $511,000,000 for the period up to June 1, to increase exports to O.E.E.C. countries and to increase taxation. With relative stabilization in raw materials prices after March and the rapid increase in German exports the German position in E.P.U. improved rapidly after June, and by October the German payments position within E.P.U. was in balance.

In May E.P.U. also extended special credits to Austria and Portugal, to ease their payment difficulties. On July 3 it granted additional credits of $15,000,000 to Austria, $45,000,000 to Greece and $12,500,000 to Turkey. On Aug. 3 the O.E.E.C. council raised the west German credit quota from $320,000,000 to $500,000,000 for 1951–52, as a result of the rapid growth of Germany's share in world trade. It raised the Netherlands quota from $330,000,000 to $335,000,000, and urged the Netherlands and Belgium-Luxembourg to take measures to correct the large excess of Belgian exports to the Netherlands, since Belgium now held a surplus of $225,000,000 in E.P.U. credits of the quota of $320,000,000, which it could not exceed without leaving the E.P.U. On Aug. 10 the O.E.E.C. council increased the Belgian quota by $15,000,000 and directed Belgium to receive gold for payment of excess exports up to the amount of $15,000,000 additional. In December the E.P.U. board warned Austria of the dangerous effects of exceeding its E.P.U. quota of $80,000,000 by as much as $47,000,000 of additional grants and urged Austria to increase taxation, to recover a larger share of the foreign exchange earned by exports and thus to check flight of capital.

Britain and France, which had previously accumulated surpluses with the E.P.U. clearinghouse, began in June to run large deficits with the O.E.E.C. area. In November both governments re-established numerous restrictions on imports and on invisible transactions. Because of a special provision protecting the use of sterling balances in settling intra-European accounts through E.P.U., Great Britain received, at the close of the year, an E.C.A. payment of $39,800,000. This sum offset only a small part of the large deficit of the sterling area with E.P.U., however, which amounted to $204,800,000 in September and another $249,600,000 in October. By Oct. 31 Great Britain had drawn $460,000,000 of its "quota" of $1,060,000,000 while France had drawn $154,700,000 of its "quota" of $520,000,000.

At the close of 1951 it was clear that E.P.U. had made important contributions to freeing intra-O.E.E.C. trade and transfers. On the other hand, it could do little about basic factors which made some currencies stronger than others. Confidence in its usefulness and viability led its member governments to plan for the renewal and modification of E.P.U. before the expiration, on June 30, 1952, of the original agreement. Under U.S. pressure, the O.E.E.C. council agreed that in 1951–52 the United States would no longer give direct aid, in dollar funds, to E.P.U., but would assist four debtor members—Austria, Greece, Iceland and Turkey—to meet their deficits with E.P.U., thus indirectly providing limited dollar funds for E.P.U. O.E.E.C. members were discussing, however, the feasibility of increasing the dollar reserves from $300,000,000 to $450,000,000 or even $650,000,000. It was believed that the new Mutual Security agency (MSA) would be able to contribute new dollar reserves through forward financing of dollar orders for armaments production within Europe, as Great Britain had already been doing through placing sterling orders in Belgium.

With the growing speed of rearmament by the United States and the North Atlantic Treaty organization (NATO), economic assistance became increasingly subordinated to the problem of rearmament, although the Truman administration tended to emphasize the building of both economic and military strength in Europe. Although ECA Administrator William C. Foster reported, on Feb. 12, that Europe could increase its production and thus carry the cost of rearmament while still continuing its economic recovery, he also announced that because of the world crisis the emphasis in U.S. economic aid had shifted to support of rearmament. (*See* also NORTH ATLANTIC TREATY ORGANIZATION.)

On May 24 Pres. Harry S. Truman requested congress to appropriate $8,500,000,000 in 1951–52 for the Mutual Security program, including $6,250,000,000 for military aid and $2,250,000,000 for economic aid, in addition to an increase of $1,000,000,000 in the lending authority of the Export-Import Bank of Washington. Divided by regions, the proposal was for $5,240,000,000 in military and $1,650,000,000 in economic aid for Europe; $415,000,000 in military and $125,000,000 in economic aid for the middle east and Africa; $555,000,000 in military and $375,000,000 in economic aid for Asia; and $40,000,000 in military and $22,000,000 in economic aid for Latin America. The president also proposed that military aid be handled by the department of defense and economic aid by the ECA and the Technical Cooperation administration within the department of state, and that these programs be co-ordinated through a committee headed by the director of international security affairs in the department of state.

Hearings were begun on June 26 by the committee on foreign affairs of the house of representatives, and on July 27 by the senate committees on foreign relations and defense. Secretary of Defense Gen. George C. Marshall estimated that military aid would total $6,300,000,000 yearly for three years, and Secretary of State Dean Acheson estimated the total program of foreign aid, military and economic, at about $25,000,000,000 over the same period. On Aug. 10 the house committee on foreign affairs reported out an MSA bill for $7,800,000,000, cutting $550,000,000 from the aid for Europe and $11,250,000 from the $112,500,000 for aid to Korea, and adding $50,000,000 for the relief of refugees in Israel. It also recommended the creation of a unified agency to handle all foreign aid programs. Beginning debate on Aug. 16, the house cut $350,000,000 from the bill and rejected larger cuts, setting a total of $7,500,000,000, with $6,000,000,000 for military aid and $1,500,000,000 for economic aid.

The bill reported jointly by the senate committees on foreign relations and defense also provided for a program totalling $7,500,000,000, and for administration of three programs by the department of defense, department of state and the ECA, coordinated by a single administrator. Beginning its debates on Aug. 29, the senate on Aug. 31 passed a bill providing $7,300,000,000, including $6,000,000,000 for military aid and $1,300,000,000 for economic aid.

On Sept. 27 the conference committee reported a joint bill for $7,483,000,000; after an appeal by Gen. Dwight D. Eisenhower, the committee had increased the allocation for European economic aid. The joint bill provided $1,022,000,000 in economic and $5,028,000,000 in military aid for Europe. The conference bill provided for the abolition of ECA on Dec. 31, and the establishment of a Mutual Security agency (MSA) under a director appointed by the president to administer the economic programs. The department of defense was to supervise the administration of military aid, and the department of state the technical assistance or Point Four program. The conference bill was approved by the senate (56–21) on Oct. 2, and by the house (234–98) on Oct. 5 with a minor amendment which was approved in turn by the senate. On Oct. 10 President Truman signed the Mutual Security Act of 1951.

By appropriations bills, passed by both houses on Oct. 20 and signed by President Truman on Oct. 31, $7,300,000,000 in new funds and $817,000,000 in unexpended funds were provided for the program, including $5,800,000,000 for military aid, $1,400,000,000 for economic aid and $100,000,000 for aid to Spain. The senate also approved the appointment of W. Averell Harriman as MSA director.

The ever-closer connection between economic recovery and rearmament was illustrated in the appointment of Harriman, on Sept. 26, to a special North Atlantic committee, established by the NATO council to "prepare a coordinated analysis of all NATO defense plans in relation to the political and economic capabilities of the member countries." Other members were Sir Edwin Plowden of Great Britain and Jean Monnet of France. The committee was reliably reported to have informed the NATO council in December that all member countries except Great Britain should increase substantially their defense efforts and expenditures. These, in turn, were felt to depend in large measure on the extent of direct economic aid to be extended by the United States and of dollar purchases of military equipment in NATO countries, and upon other means of providing dollars to fill an expected gap in 1952 of $4,000,000,000, as against $2,000,000,000 in 1950. The committee urged the NATO countries to expand their production on the average by 14% in the three fiscal years ending June 30, 1954, in order to carry through rearmament without lowering living standards.

AEGEAN ISLANDERS waiting to see motion pictures being shown in conjunction with a floating exhibit sponsored by the ECA mission to Greece. The good-will information ship toured the islands in the summer of 1951

At the close of the year MSA was reported as recommending that the president use the authority given him in the act to transfer $580,000,000 from military to economic aid, to supplement the $1,022,000,000 in economic aid authorized for Europe. MSA was also hopeful of placing in Europe $550,000,000 in dollar orders for military equipment. It was reported that France would receive $170,000,000 in direct economic aid and perhaps $400,000,000 in military expenditures, including troop pay. Great Britain, which had received no new ECA funds after Jan. 1, 1951, and which was now losing its reserves at an alarming rate, was reported to be assigned $300,000,000 for 1951–52, but it was not clear whether any of this would be in the form of direct economic grants. Greece received an allotment of $182,000,000. Other allotments had apparently not been completed at the close of the year. By mid-1951 the emphasis had shifted to rebuilding the armed strength of NATO, together with that of Yugoslavia and probably of Spain. Since O.E.E.C. included western Germany, Ireland and Sweden, which were not members of NATO, as well as Greece and Turkey, which were not yet included in NATO, the extent of its future role was not clear. (*See* also EUROPEAN UNION; INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT; TARIFFS). (P. E. M.)

European Union. As the first visible expression of the tendency toward European unity in the official diplomatic field, the statute of the Council of Europe, a multilateral treaty formally ratified by the signatory governments, was signed on May 5, 1949. By the end of 1951 all European states outside the soviet orbit were members of the new organization with the exception of Austria, Yugoslavia, Spain, Portugal and Switzerland. The German Federal Republic became a full member on May 2, 1951. The organization adopted the green and white "E" flag of the European movement and established its capital in Strasbourg, Fr. The first two years of the organization were marked by the strained relations between its executive, the Committee of Ministers, which wished to proceed most cautiously on the road to further unification, and the legislative or rather proposing body, the Consultative assembly, which pushed toward greater integration and wished to enlarge its function. This organizational strife expressed at the same time a difference of approach on how to achieve greater unity, whether immediately by a federal constitution of Europe or by the slower and more haphazard functional approach. On the whole it may be stated that the French and Italians favoured the creation of a supranational federal government with definite though limited powers, while the British, the Scandinavians and most of the representatives of the Benelux countries (Belgium, the Netherlands and Luxembourg) supported setting up specialized authorities in specific fields through intergovernmental accords, without abandoning the sovereign powers of the various states. By the end of 1951 it seemed decided that this cautious functionalism would be the approach to a growing European unity and that plans for an immediate federation would be abandoned as too ambitious and premature. British governments, whether Labour or Conservative, held aloof from a complete European federation. Responsible for this attitude was not only the traditional British approach of evolutionary gradualism but also the conviction that Britain was as closely tied in with the United States, Canada and the British Commonwealth as with continental Europe. A lasting solution for the security, prosperity and moral vigour of the democratic nations threatened by totalitarianism demanded in the opinion of many people a wider framework than European unity; namely, an Atlantic union, the integration of all lands of western civilization with the North Atlantic as its central basis. Such an integration was slowly and functionally growing in 1951 in the build-up of the North Atlantic Treaty organization and its affiliated economic bodies. The two movements toward European union and toward Atlantic union supplemented each other. They represented two interdependent manifestations of the same fundamental need, the union of the nations sharing a common cultural and political heritage in a geographically shrinking and spiritually threatened world.

The Council of Europe met for its regular spring session in Strasbourg at the beginning of May 1951. The Federal Republic of Germany took its part there for the first time as a full-fledged member. The assembly decided to support the Schuman plan and the European army plan and to build these two supranational organizations into the framework of the Council of Europe. Paul Reynaud of France submitted a resolution to invite members of the congress of the United States and of the parliament of Canada to the coming fall session of the assembly. The invitation to Canada was dropped because the Canadian government and the other members of the British Commonwealth had already agreed tentatively to send observers to the next session. Thus it was decided to approach the congress of the United States through the speaker of the house and the presiding officer of the senate to arrange for a discussion of problems of common interest by delegates from the U.S. congress and from the Consultative assembly.

The meeting between the U.S. congressmen and the Europeans took place in Strasbourg in November. The Americans through their chairman, Sen. Theodore Green of Rhode Island, expressed deep regret at the slowness of Europe's political and economic integration. The Europeans, conscious of the difficulty of uniting nations with different languages and long and conflicting histories, could not see any analogy between their own case and the federation of the 13 former English colonies in North America with their common language, their common background and their relatively short history. Not the federation of the former English colonies but a federation between the United States, Mexico and the Central American republics could provide a true analogy to the federation of Europe. Finn Moe of Norway declared that a purely European union would not be workable without the participation of North America. Asked whether Norway would yield to an Atlantic union the sovereignty that his country refused to yield to a European union, Moe answered, "Yes, because we have already yielded sovereignty to the North Atlantic Treaty Organization." Robert Boothby of Great Britain supported Moe and declared that the ultimate aim should be a merger of the Council of Europe with the North Atlantic Treaty organization. Sen. Robert C. Hendrickson of New Jersey referred to the Atlantic union resolution before the U.S. congress that proposed a meeting of the Atlantic nations to explore together the possibilities of an Atlantic federal union.

In its deliberations the Consultative assembly of the Council of Europe proposed the calling of a European conference in 1952 to co-ordinate all existing European organizations. It asked for the formation of a new organ of the Council of Europe, to be composed of ministers for European affairs appointed by each of the member states. Sir David Maxwell Fyfe, British home secretary, stated British willingness to co-operate with a political federation of Europe without, however, joining it. A country in Great Britain's position, he stressed, was unable to take such a step, because it was at the centre of three concentric circles. The first of these was formed by Great Britain and the Commonwealth of Nations, the second by the United States and Canada and the third by the western European countries. He promised a close association of Great Britain with any authority emerging from the unification of the free countries of the European continent. On behalf of his government he agreed to the holding of a European conference of parliamentarians and experts to review the whole question of a European organization, including a proposal to have Europe join the sterling area by a preferential agreement with Great Britain and the Commonwealth of Nations.

Under French leadership, a resolution proposing an amendment to the statute that would permit the council to develop a European political authority with the active participation of part of the member nations and in close association with Great Britain and other nonparticipating states was submitted. The Consultative assembly endorsed the formation of such a supranational authority to control the projected European army on Dec. 11, 1951, by a vote of 60 to 10 with 12 abstentions. The powers of the authority would be limited to those fields of defense and foreign affairs in which joint exercise of sovereignty was rendered necessary by organization of a European army within the framework of the North Atlantic treaty. In the debate the representatives of France, Italy and the German Federal Republic spoke strongly in favour of a genuine fusion, while the Scandinavian and Benelux countries were reluctant to commit themselves without leading British participation.

Two practical steps were started successfully in 1951, the Schuman plan and the plan for a European army. Both plans were initiated by France and were sponsored by France, Italy, the German Federal Republic and the Benelux nations, six nations which embrace more or less the territory which was included in Charlemagne's empire. The two projects represented two sides, the economic and the military, of the same attempt to solve the problem of how to create a strong community of free Europe (which could not be done without using the superior resources in industry, skill and manpower of Germany) without submitting this Europe to German domination.

In Dec. 1949 the committee on economic questions of the Consultative assembly of the Council of Europe recommended a scheme to create intra-European companies, including one for iron and steel. In May 1950 Robert Schuman, French minister of foreign affairs, announced a plan for the pooling of coal and steel resources throughout Europe. Schuman proposed that the entire French and German production of coal and steel be placed under a joint high authority within an organization open to the participation of other European nations. Thus a concrete measure of solidarity and a common basis for economic development would make future conflicts between France and Germany impossible, and would at the same time create a single market which would lead to increased production and lower prices and thus to a better standard of living. On March 19, 1951, the delegates of six nations, France, Italy, the German Federal Republic, Belgium, the Netherlands and Luxembourg, formally initialled in Paris a draft treaty to give legal effect to the Schuman plan. The treaty would be valid for 50 years, with a transitional period of 5 years allowed for the full application of the plan. A board called the High Authority, with members elected for six years, would supervise the two basic industries. It would be assisted by a Consultative committee of 30 members, representing equally workers, employers and consumers, and by an assembly composed of members of the parliaments of the six countries chosen by the parliaments. This assembly would meet once a year to review the work of the High Authority. By a two-thirds' vote of censure it could compel members of the authority to resign. Appeals from decisions of the High Authority could also be taken to a court of justice of seven judges chosen by the participating governments. Finally a council composed of one member of the cabinets of each of the six participating states would try to harmonize the actions of the High Authority with the general economic policies of the governments. Thus the plan, if carried out, would not only revolutionize the structure of the coal and steel industries of western Europe but also greatly change the traditional concept of national sovereignty. The new coal and steel community would disregard national political frontiers.

A statement published at the time of the signature of the pool pact by the foreign ministers of the six participating countries referred to it as the first supranational institution, which it was hoped would be followed by others applying to wider economic fields and preparing for a political community. The assembly set up in the treaty to represent the six nations in the single market area would be the first international body to acquire actual powers. The treaty provided also that changes in the rules covering the operation by the High Authority must be approved by two-thirds of the assembly and by the court of justice. France, Italy and Germany would each send 18 representatives to the assembly while the Benelux countries would have 24 seats. The High Authority would consist of nine members and would not include more than two members of any one nationality, thus assuring representation for the small countries. It was stipulated that the authority should "neither seek nor accept instructions from any government or organization" and should act in complete independence in the general interest of the community. The U.S. department of state hailed the agreement reached in Paris on the Schuman plan and expressed the hope that the parliaments of the participating countries would ratify the plan as a whole. It was suggested that the seat of the new economic government should be in an area detached from the existing states, like the District of Columbia, this area to be called European territory. The Consultative assembly of the Council of Europe voted on May 11 in favour of ratification of the Schuman plan treaty. The first nation to ratify the treaty was the Netherlands, and on Dec. 13 the French national assembly ratified it by the unexpectedly large majority of 377 to 233 votes. The Communists and most of the followers of Gen. Charles de Gaulle voted against the bill. The vote in the German parliament in Bonn was scheduled for Jan. 1952.

The counterpart to the Schuman plan in the economic field was the European army plan in the military field. It, too, originated in a proposal adopted in Strasbourg in Aug. 1950 by the Consultative assembly of the Council of Europe, acting upon a suggestion by Winston Churchill. René Pleven, prime minister of France, proposed in Oct. 1950 to the French national assembly the creation of a European army as part of the North Atlantic treaty defense system. In Dec. 1950 the French government decided to call together representatives of the governments interested in the creation of a European army in order to lay the basis of its organization. The conference met in Paris on Feb. 15, 1951. In his opening address Robert Schuman, French foreign minister, spoke of the need of creating a Europe which would overcome outdated nationalism. "France is profoundly convinced that we must communicate to the peoples of Europe an awareness of their own solidarity, and that we must at the same time give them institutions and means which will permit them to express this solidarity. Five years after the end of World War II, forgetting their past struggles in their concern for the common future, nations previously divided have come together around the same table in order to try to substitute for that which was the very instrument of these struggles, namely, national armies, a common army which could be used only in defense of their common civilization."

On July 24, 1951, delegates of France, Germany, Italy, Belgium and Luxembourg signed an interim report that called for a 50-year pact, pooling all their military resources under a joint supranational authority, with a joint European defense fund to meet the expenses, a single system of supply and procurement and an integrated general staff, an integrated air force and integrated regulations regarding uniforms and European schools for the training of personnel. In November these nations and the Netherlands, in a joint report to the North Atlantic council meeting in Rome, agreed that a European defense community should be created as quickly as possible and placed, at least initially, under the command of Gen. Dwight D. Eisenhower. The six nations hoped that the various constitutional steps required to bring the European defense community into being could be carried through by April 1, 1952. The United States government originally opposed the French plan and held out for an independent rearmament of Germany within the North Atlantic Treaty organization. But by the middle of 1951 the United States was won over to the French plan and supported it as the only way for persuading the Germans to take the political risk of rearmament and to share in the defense of Europe without a danger of the reawakening of German militarism and aggressiveness. Konrad Adenauer, chancellor of the German Federal Republic, and Alcide de Gasperi, prime minister of Italy, throughout supported the European army plan wholeheartedly. In spite of the great difficulties involved, many of the details of the complex organization were worked out. Great Britain adopted the same policy as the United States. The two powers not only accepted the French plan, after initial hesitations, but also made it the basis of their policy toward Germany.

The European army was envisaged to consist of 43 divisions plus tactical air units by midsummer 1954.

In this force Germany would have 12 divisions, each coupled with 1 or 2 non-German divisions in separate army corps. The administration of this European force was suggested on lines similar to those of the Schuman plan. There would be a council of ministers, consisting of the ministers of defense, or ministers for European affairs, of each participating nation, forming the High Authority—the ministers for European affairs would later be responsible for both the European army and the Schuman plan development—an assembly of parliamentarians of the participating nations, later perhaps to be elected on a European rather than a national basis, and a commissioner or a collegiate body consisting of a chairman with three high-ranking assistants of different nationalities, to act under the supervision of the council of ministers and of the assembly. Winston Churchill, on behalf of the British government, approved in a statement in Dec. 1951 the formation of a European army as the right way for the integrating of democratic Germany into Europe's defensive organization, and promised to associate Great Britain as closely as possible with the European defense community in all stages of its political and military development. Exchange Control and Exchange Rates.

After the outbreak of hostilities in Korea in 1950, world prices of primary products had risen spectacularly, both absolutely and relative to the prices of manufactured goods. This, together with the resulting attempts by industrial countries to accumulate raw material stocks, caused most raw material-producing countries (or the monetary areas to which they belonged) to regain, in particular from the United States, a substantial amount of the gold losses they had experienced in the period before the devaluations of Sept. 1949. From about the middle of 1951, however, the situation changed. Quite apart from seasonal influences and the decline in stock-piling purchases in the United States, some fall in raw material prices and the impact of rising expenditures on armaments in some countries of western Europe brought a considerable shift in the ownership of gold and dollar assets. The sterling area, which had shown the greatest increases up to that point, showed the heaviest losses, while French reserves also declined substantially. Unlike 1949, however, when practically all the movement of gold and dollar assets had been in favour of the United States, the disequilibrium in international transactions was not confined to those between that country and the rest of the world. In fact, up to the end of the third quarter of the year, the rise in U.S. gold reserves was equivalent to only half the loss sustained by the sterling area alone. Among other countries whose reserve position improved, Germany, Belgium and the Scandinavian countries in Europe, and Japan and Indonesia were perhaps the most important. The change was not therefore merely a recurrence of the postwar dollar crises which had been particularly intense in 1947 and 1949.

There were few important exchange rate changes in 1951. The stronger position of the raw material-producing countries was probably chiefly responsible for the establishment of official par values for the Finnish, Swedish and Pakistan currencies (in all cases at the effective rates) and for the simplification of Colombia's multiple-rate structure.

In the sphere of exchange restrictions the ending of exchange control in Canada was almost the sole bright spot in a picture that became increasingly somber as the year drew to a close. Import restrictions were relaxed in various Latin-American countries mainly in an effort to obtain supplies of imports that threatened to become scarcer. The freeing of forward sterling in December was also a striking development. On the other hand, the more severe restrictions imposed in France and the U.K. as a result of renewed exchange difficulties, together with the mounting rearmament expenditures throughout western Europe, gave the impression that the predominant tendency was toward more rather than less strict exchange controls.

United States.—Toward the end of 1950 the disequilibrium in transactions between the United States and the rest of the world had almost disappeared. Less than a year later, however, it had again become considerable, and the "dollar gap" had again become a serious problem for some countries. The strengthening of the international economic position of the United States was reflected both in the appreciation of the dollar in most of the world's free foreign exchange markets and in the U.S. balance of payments. U.S. exports rose more sharply than imports in the first half of the year, and thereafter fell less rapidly when the post-Korean buying wave appeared to have run its course.

Influenced both by seasonal and temporary factors, the surplus on current account (goods and services), which had shrunk to an annual rate of only $300,000,000 in the third quarter of 1950, increased steadily to reach an annual rate of almost $4,500,000,000 in the corresponding period of 1951.

In the first half of the year the surplus totalled about $1,800,000,000. In this period U.S. government economic and military aid amounted to almost $2,300,000,000, with the latter taking an increasingly larger share of the total. Since such aid, together with private outward capital movements, substantially exceeded the over-all surplus on current account, the outflow of gold from the United States noted in 1950 continued.

From in excess of $22,800,000,000 at the end of 1950 the United States gold stock fell by more than $900,000,000 at the end of June. In subsequent months, however, with the current account surplus exceeding U.S. government aid, the direction of the gold flow was reversed, and by the end of November more than $700,000,000 of the losses had been recovered.

Canada.—Already in 1950 the Canadian government had allowed the exchange rate for U.S. dollars to fluctuate in accordance with free market forces. Because of the continued strength of the Canadian international economic position, influenced by a steady inflow of capital from the United States, the Canadian dollar continued to appreciate, reaching 1.036 per U.S. dollar at the end of November, compared with the par value of 1.100 established in 1949. In these circumstances the Canadian authorities took a step without precedent since the end of World War II and amended the Foreign Exchange Control regulations on Dec. 14, 1951, to remove all existing restrictions on payments or on receipts of foreign currencies. In the last days of the year the exchange rate for the Canadian dollar was steady at about 1.025 per U.S. dollar.

Latin America.—In general the economic position of Latin America was strong in 1951, mainly as a result of continued favourable terms of trade, and there were relatively few changes in exchange rates or regulations in that area. Of those that did occur, the steps taken to unify the rate structures in Colombia and Paraguay were the most significant.

The Argentine peso continued to show signs of weakness in 1951. The curb rate was 29 pesos per U.S. dollar at the end of September compared with 19.50 at the end of 1950, and in October the Argentine Central bank suspended the issue of prior exchange permits for the import of goods to be paid for with foreign exchange obtained in the free market. Thereafter the curb rate strengthened appreciably.

Minor changes were made in the Brazilian exchange regulations. Compensation or barter transactions in certain commodities, which had been permitted prior to Feb. 8, 1951, were suspended after that date. In order to legalize dealings in notes and coins and to encourage the inflow of new foreign capital, preparations were also made to create a special free exchange market. According to a bill submitted to congress in August, all import and export transactions, including payments for related services, all government receipts and payments and all transactions specifically provided for in agreements would continue to be carried on at the official rates, but all other transactions would take place at the free rate, which would be governed by supply and demand. New foreign capital was to be permitted to enter through either market, but if it came in at the official rate the resulting dividends would also have to be remitted at the official rate and subject to limitations previously established. In anticipation that the curb market would be legalized, the curb rate, which had fallen as low as 32.50 cruzeiros per U.S. dollar in the summer, hardened somewhat and stood at 29.20 cruzeiros per U.S. dollar at the end of November.

In the course of 1951 some modifications, particularly the application of mixed rates to certain agricultural exports, were made in the Chilean multiple-rate structure in effect since Dec. 1950. In addition, the scope of the free market was substantially restricted. The rate for the U.S. dollar in this market had appreciated steadily in 1950 to about 70 pesos per U.S. dollar. Because of increasing inflationary tendencies within the country, however, it had weakened to more than 90 by July 1951. To meet this situation the National Foreign Trade council adopted several measures to restrict dollar imports. After July 18 the purchase of various goods previously imported from the dollar area with exchange obtainable in the free market was permitted only in countries with which Chile had payments agreements. Exchange transactions for all imports still permitted from the dollar area with exchange obtainable in the free market were not permitted until after the arrival of the shipping documents in Chile and had to be completed at the exchange rate then prevailing. Free market exchange transactions connected with trade had to be carried on only through authorized banks, which were forbidden to purchase free market exchange for their own account and were required to post exchange rates and report both these and the volume of transactions daily to the National Foreign Trade council.

On March 20 the Colombian government took an important step to simplify the complicated multiple-rate structure hitherto in effect and to reduce restrictions on imports. A new rate of 2.50 pesos per U.S. dollar was made applicable to all foreign exchange transactions except coffee exports. A total of 25% of the exchange proceeds from the latter received the new rate, while the old buying rate of 1.95 pesos to the dollar was applied to the remaining 75%, thus giving an effective rate of 2.0875 for coffee exports. Apart from the prohibition of specified luxury imports, all licensing restrictions were progressively removed, as were the exchange certificate system and all mixed-rate arrangements. Most of the differential exchange taxes were also abolished, and a uniform stamp tax of 3% on practically all foreign exchange sales took their place.

The new system did not involve any change in the existing par value of 1.94998 pesos per U.S. dollar, but the International Monetary fund approved it as a step toward the eventual declaration of a new par value. This was not done at once mainly because of the inflationary impact of applying the 2.50 rate to all coffee exports. However, on Oct. 29 the effective coffee export rate was changed to 2.17 pesos per U.S. dollar by applying the 2.50 rate to 40% of the export proceeds. At the same time the Colombian government announced its intention of increasing by 1.5% per month the amount of coffee exports receiving the 2.50 rate. At the end of 40 months all coffee exports would be sold at 2.50 pesos per U.S. dollar and the contemplated unification of the exchange rate structure thus achieved.

At the beginning of March, after prolonged consultation with the International Monetary fund, the government of Paraguay declared a new par value for its currency of 6 guaranies per U.S. dollar. At the same time sweeping changes were made in the exchange rate structure, reducing the number of rates for both imports and exports, narrowing the spread between the higher and lower rates and thus simplifying a very complicated multiple-currency system. The new system provided for an official market with two fixed rates covering most exchange transactions. Major exports (lumber, quebracho extract, cotton, meat and hides), some essential imports and most government transactions, including official imports and public debt service, were carried on at the rate of 6 guaranies per U.S. dollar. A rate of 9 guaranies to the dollar was applied to all minor exports, to registered capital transactions and to essential imports not permitted at the 6-guaraní rate. From March 5 to April 2 freight and insurance payments were also made at the 9-guaraní rate, but thereafter took place at the legal free market rate established on March 5 and applicable to other transactions. Free market rate quotations began at 20 guaranies per U.S. dollar but weakened substantially in subsequent months, standing at 33 to the dollar in October.

The Sterling Area.—In 1951 the weakening in the position of the sterling area, and particularly the United Kingdom, was almost as spectacular as the improvement had been in the previous year. Because of an increased trade deficit arising mainly from an adverse movement in terms of trade, the United Kingdom had an over-all current account deficit equivalent to $342,000,000 in the first half of the year, compared with surpluses equivalent to $118,000,000 in the first half and more than $500,000,000 in the second half of the previous year.

At $305,000,000 the United Kingdom dollar deficit was as large as it had been in the whole of 1950, and a current account deficit equivalent to $73,000,000 was recorded with the O.E.E.C. (Organization for European Economic Cooperation) countries, compared with a surplus equivalent to $342,000,000 in the previous year. Current transactions with the rest of the sterling area resulted in a surplus equivalent to only $129,000,000, or less than half the 1950 rate, and was accompanied by an export of capital from the United Kingdom at an accelerated pace. Despite some deterioration in the terms of trade resulting from declining raw material prices, the position of the rest of the sterling area remained strong, and its surplus with the dollar area, at $415,000,000, was almost as large as for all of 1950.

Substantial amounts of hard currency were also earned from transactions with the European Payments union, from gold sales by sterling area countries to the U.K. and from capital transactions, so that for the first half year the sterling area had a gold and dollar surplus of $414,000,000, equal to the rate for the previous year. Receipts from E.C.A. (the Economic Cooperation administration) for goods in the "pipe line" brought the increase in the central reserves of gold and dollars up to $568,000,000 so that at the end of June they stood at their postwar peak of $3,867,000,000.

In the second half of the year, however, under the impact of lower raw material prices, the growing rearmament burden on the United Kingdom, the dollar drain caused by the cessation in the flow of oil from Iran, not to mention seasonal and temporary factors, the gold and dollar reserves of the sterling area fell by no less than $1,532,000,000, bringing them down to the lowest level since the middle of 1950. In the last quarter changes in the timing of payments resulting from a certain loss of confidence in sterling were obviously important. Importers from the sterling area may have delayed purchasing sterling as long as possible, while sterling area exporters to the dollar area may have delayed the repatriation of their export proceeds as long as they could.
